Akin to this characteristic, and growing out of it, perhaps, is an insensitiveness to noise. The nerves of the Anglo-Saxon have often been explained on the score of climate, but the obtuseness of a northern Chinese to racket and din is as great as that of his fellow countrymen in the mellower South; there is no more irritating climate than that of Spain and many of the harsher altitudes of the Andes, yet neither Spaniard nor Spanish-American is stirred from the serene placidity by the uproars of his private and public life. No single manifestation of the Latin's fondness for noise touches the visitor so poignantly as the unused mufflers of the automobiles. This seems a trait as persistent and characteristic as the loud and unceasing chantey of a laboring coolie. The cries of the street vendors of the Spanish world, less objectionable from the point of view of cacophony, because of their melody, are remindful of the guild songs of China.

Although the Chinese are not popularly understood to possess the quick, hot blood of the Latins, they nevertheless have a national proclivity for choler. Sudden and prolonged outbursts of rage manifest themselves in a process called "telling the street." In the course of these noisy demonstrations unbelievable verbal filth and profanity are hurled forth, generally in damnation of the offender's ancestry. This persistent and smouldering anger, like that of a turkey gobbler, has something of a parallel in the Spanish *rabia*, which manifests itself not so much in profanity, although there is plenty of that in the Iberian idiom, but in sudden acts of violence—the traditional flash and play of an angry blade.

Probably all this is the result, in either case, of a certain Oriental pride to which the thought of compromise is intolerable. In China it is so well defined as to have a definite term. It is known there as "face." Life is insupportable to the Chinese who has received either a real or an imaginary affront. His riper philosophies, however, have conspired to relieve him of some of the harsher consequences of wounded pride. He rarely comes to blows, or to any form of corporeal reprisal. Sometimes his "face" is saved merely by the process of hurling profane imprecations upon his traducer. It makes no difference to him that at the same time he advertises the offense against himself, for this act of reviling, according to the Chinese convention, saves his honor.

"Face," the combination of pride, self-will and touchiness, has made the man of both Chinese and Spanish origin a poor loser. Unwillingness to yield a point has necessitated the Chinese system of the go-between without which business and personal adjustments would be difficult if not impossible. In the Spanish world the mortification of defeat or of personal derogation has engendered acts of violence that have come to be excused on the ground that such matters are beyond human control.

"Face," has made the Chinese backward in competitive sports, and it is to be suspected that the same influence, combined with other things as fundamentally Oriental, has kept the Spaniard out of them as well. Neither one is constitutionally apt in physical exercise, which is only of recent years being taken up by the younger and more progressive.

Not until a short time ago did the frequent spectacle of a Chinese team of players retiring from the field when the game was going against them cease to call attention to the influence of "face" in sports. In politics it still manifests itself in the unwillingness of the losing party to accept defeat, and this is a trait that has kept South American politics boiling with revolutions during the hundred years that have intervened since the beginning of the Latin republics.

In fine distinction to the rough edges of deportment that are made inevitable by the system of "face," and as a necessary foil to it as well, is the elaborate code of conventional forms governing personal conduct. The Confucian rules of ceremony are three hundred in number, and the rules of behavior three thousand. They are rigid and cover every possible contingency. And scarcely less formal are the conventional courtesies that govern the genteel in South America.

But, as is always the case with elaborated conventions, there is a deep stratum of insincerity beneath the polished veneer of manners in both the

Cleveland and the Republican Elephant

A True "Close Up" of the Cleveland Convention With the Ballyhoo Cut Out

By A. R. PINCI

THE most peculiar feature about the recent Republican National Convention is that half a mile or so away from the Public Auditorium no one could have suspected that an organization ordained to nominate a candidate for President of the United States was in the midst of Cleveland. Crowds were conspicuous by their absence, and very few souvenir, banner and emblem vendors were about. The old-time street fakers, which until a few years ago were part and parcel of any visitors' army that descended upon a town, evidently remained behind, either in New York or Chicago or playing the last few remaining rural centers.

East Sixth street, from Lakeside avenue to Superior avenue, was animated, to be sure, but most of the liveliness was contributed by lusty-lunged newsboys crying their latest edition, and it was easy to guess that business was not booming for them. In fact, it was not easy to sell a newspaper announcing Calvin Coolidge's nomination six months after every visitor there, with the possible exception of two states, virtually found it in the Christmas stocking.

Of course, the identity of the successful nominee for the Vice-Presidency did puzzle veteran observers and indubitably was the only promising topic of discussion, but by the time that the nomination was to be effected, the tail end of the convention was in sight and discounted, and nine out of every ten visitors were thinking in terms of trains and home—incidentally, also, of food, through bad parliamentary tactics.

No wonder the convention was stale! The newspapers referred to it as cut-and-dried, which is not exactly the description, because *sub rosa* it was remaking Republican partisan history, but it was stale because it was badly timed, both as to date and hours. Punctuality is a word unknown to convention managers, evidently, and that is fatal. Convention managers are there on business, either paid for their trouble or otherwise free of worries about the cost of indefinitely visiting a more or less strange town, while delegates and their groups are almost in the same boat, but that is not true of the army of casuals who alone can be depended on to make such affairs a huge success. I doubt very much if Cleveland realized more than a small percentage of returns from visitors, and while big cities vie with each other to win the honor of extending hospitality from a sense of pride, still the eye to business is open, and justly so.

There is no more superstitious individual than the politician, but when he is multiplied by several hundred in a single gathering it means as solid a block of superstition as may exist this side of the Middle Ages. Friday the thirteenth is alleged to be a hoodoo day, the first of the excluded ones. Woodrow Wilson, twelve years ago, was warned against the day, but he laughed the advice aside, repeatedly, but there are many, countless many, who think of him, shake their heads wisely, eloquently, and clinch their belief more seriously than ever.

A Few Snapshots

NEVERTHELESS and notwithstanding, the Republican convention was held during a week that included that fearful day, which to all intents and purposes had either to be anticipated or jumped over. No self-respecting political convention would dare transact any major business on that day, even though Saturday was sure to be reached.

Whatever attention an arranged pugilistic encounter did not attract was chiefly directed to the antics of an aviator who elongated more necks that day than any of the convention potentates. Fireworks were planned as an added attraction, but the rain and thunder beat the pyrotechnics to it. We, inside the auditorium, did not know which was which, as it was difficult to attune one's ear to the diverse sounds in the midst of the hubbub about us. What with the organ, the band, the speakers, and Chairman Mondell's gavel beating an occasional tempoless tattoo upon a wheezy board, powder and lightning were about alike.

So much for the circumstances that through thoughtlessness or carelessness or self-assurance made up much of the cut-and-dried atmosphere from the Clevelanders' standpoint.

The city was delightfully dry, in a prohibition sense. I won't say that drinks of more than the lawful content were not imbibed, but whoever did so did it discreetly. There were no alcoholic breaths. There was none of that semi-idiotic hilariousness that a spurious Bacchus inspires. Apparently Cleveland made good on prohibition, as far as many of us could judge.

But regarding weather it was not so good. Much of the time we had what I shall term umbrella-dry weather; the kind that is rainless if one is armed with an umbrella or cravenette—the kind that is deluging when portable watersheds are left behind. A little sunshine peeking in at the window at rising hour, just enough to tempt one with the gayest raiment, but whose immediate disappearance shortly afterward the weather man explains with a wonderful unintelligible explanation about areas of low pressure, when the reader's blood is at high pressure.

But why worry? In the auditorium they tried to make us forget that there was no sunshine. The spectrum was defied in every way. Color harmonics of all degrees were played. At the far end, purple was the most frequent shade; at our end, the platform end, blue was the persisting shade.

At that, blue was not out of place. Scarcely a person on the speaker's platform smiled. Instead of its being a political festival it seemed, judging by some expressions, something contrariwise. Of course, the occasion must needs be solemn by its very nature, but cheerfully so.

And now for a few snapshots.

Whenever Chairman Mondell stepped forward, whether he rapped or stood in readiness to do so, there was not that reaction of silence which denotes, more than anything else, the degree of an assemblage's attentiveness. Even after order was a reality the great majority was interested in an oft-repeated pantomime that was played for the first time at a national convention, but certainly not the last. As each succeeding speaker appeared, he had to be guided by Master-of-Ceremonies Campbell, who saw to it that the proper distance from the two radio microphones was maintained. One individual evidently did not understand why he was gently pushed this way and that, a step back, three inches sidewise, and so on. Now he'll *never* forget.

In a corner, near the railing, C. Bascom Slemp, the President's secretary, sat most of the time by himself.

In the row fronting him Frank W. Stearns, Mr. Coolidge's friend and observer, sat alone most of the time, too.

William M. Butler, new chairman of the National Republican Committee, likewise a White House familiar, lorded it alone.

Occasionally some brave one approached, sat down for an instant, or positions were temporarily changed, but on the whole the trio maintained a silent, unsmiling, noncommittal attitude. Of course, most of their work was done before and between sessions, but there is no doubt that some of their frigidity influenced bystanders, for the sort of goodfellowship so conspicuous at political gatherings of any magnitude was absent. Of course, it was impersonal, this sense of isolation or separateness, but it left old-timers accustomed to a different sort of behind-the-scenes bonhomie disconcerted, to put it mildly. One, a Roosevelt survivor, was flabbergasted, he confided.

The unseen organist, concealed beneath the platform, played some excellent compositions, while the band, shelved in a corner above the stage, bunched so close together that one wondered how the players could draw in enough air to suffice for all the trombones, cornets, and horns, was untiring in its efforts, but whether singly or together, the net effect of the music was negative. Only once did it stir enthusiasm, in the larger sense, and that was during the overrated episode anent Wisconsin's delegates' refusal to rise when the crowd wanted to make the Coolidge endorsement unanimous.

With the idea of making the incident much more dramatic in some respects than it was, and much more offensive if not "insulting," which it was not, except in the imagination of a few hoodlums, a scene was staged where the Wisconsin delegation sat which actually was more of a burlesque than a farce. Naturally, since the convention was one to ratify the President, his name was uppermost; so much so that it was dubbed a Coolidge affair through and through.

In reality it was not a question of whether the delegates aforementioned were committed to any one candidate, popular or unpopular, but it was a question of whether the fractional minority had a right to be heard at all. The hisses were decidedly out of place, because convictions are convictions, and from them must develop progress. For a thousand victors to endeavor to dismay a handful of lonely crusaders the result was not worth while, for after all the latter held their own to the last. The impromptu parade, the brandishing of state standards, the mingled voices of contending sides, was very interesting in a way, and compared by an old man to Senator Teller's break with his fellow politicians over the free silver question some three decades ago. The excitement, which showed signs of abatement several times, was artificially renewed and lasted twenty minutes. Meanwhile the Wisconsin delegation enjoyed the affair heartily. With all of their standpattism they were marvelously good-natured, and submitted to being kodaked, photographed and movied.

Some Tactical Blunders

IT WAS not until it became obvious to the platform bosses that the whole thing was developing into an absurd test of endurance that *the band began to play the Star Spangled Banner*—not by mere chance.

Practically every one in the auditorium was already standing, and only a few therefore rose for the occasion. The delegates from Wisconsin rose, too, not without remarking on the misuse of the national anthem to compel a trick victory.

On second thought it dawned upon many of the participants that the whole affair had been overdone and that they played into the minority's hands. Wisconsin received columns of advertisement that otherwise could have been measured in lines.

The next sport was that of guessing the Vice-Presidential nominee. It was a favorite pastime all through Wednesday night and Thursday morning. Everything was a formality. The only sustained interest was that awakened by Dr. M. L. Burton, president of the University of Michigan, once neighbor of Calvin Coolidge at Northampton, who was designated by the latter to make the nominating speech.

From where I sat, with William Allen White, the sage of Emporia, on my right, Dr. Burton's profile was clear as a silhouette. In it I noted a decided resemblance to the President's, even to the color of the hair. Mr. Coolidge's thatch is sparse, and therefore it seems paler than Dr. Burton's, who carefully combed his down until it shone underneath the spotlights.

How long Dr. Burton's speech would have been in its entirety only a few know, since it was shortened by mutual consent before its delivery, but unfortunately it was too long by half. White, of Emporia, and McClatchy, of Sacramento, agreed that the speaker was overenthusiastic in behalf of a subject who already monopolized about all of the enthusiasm the convention was capable of demonstrating.

To show upon what slender threads success and enthusiasm may depend or change, I need only say that toward the end of the Burton speech too many individuals were looking at their watches to see how soon it was to lunch hour; some did not even need to look. As he recited excerpts from past Coolidge views, which he must have memorized, the effect of spontaneity was suddenly lost. It may have come natural to Dr. Burton to know by heart everything he quoted from Coolidge, but to a less scholastic audience, which was becoming hungry, the interpretations he advanced anent the quotations were not appreciated to the full.

That was the first tactical error of the managers. To convene at eleven o'clock, to call the convention to order half an hour late and dawdle in doing so, were blunders. There is no reason why the convention should not have been called to order promptly at ten o'clock, if not earlier.

Calvin Coolidge was formally nominated at a quarter of two in the afternoon. The average lunch hour was over, but the convention should have recessed then. Instead, after a motion was seconded and adopted that all speeches seconding the nomination be limited to five minutes, the talking began. Talk was talk now. Gallery seats were slowly emptying.

Cutting It Short

THEN came the alleged five-minute speeches. The majority of listeners had stop-watch faces by this time and it were a blind speaker who could not perceive the timing proclivities of the audience. The two or three who made their speeches short and sweet—no one cared what they said—were applauded for their brevity.

"When do we eat?"

That, or variations of that question, began to be overheard. Shuffling of feet, nervous fanning, irrational conversation, plaintive and expectant glances toward Chairman Mondell, apparently oblivious to the growing distraction, followed. Hunger—or if not hunger, the reprehensible habit of eating at midday—began to interfere with politics.

A lusty "seconder" mounted the platform. A little applause, which was the result of nervousness, and hope against hope. At long-winded gatherings of this sort auditors soon learn from certain cadences of the voice when a natural finish is reached. But unfortunately few speakers realize that it is stopping time. The bland, encouraging expressions are not what the speaker believes—but what he does not in most cases suspect. A bid to stop he translates as the urge to go on.

That happened several times Thursday afternoon. Even the sporadic cries from various parts of the auditorium, some almost peremptory orders of "enough" and "cut it short" did not faze the leather-lunged seconders. One calmly sat on the railing waiting for the restlessness to subside, and when it did he stepped back in the proper position before the radio transmitters and talked anew. Finally Mr. Mondell was compelled to take cognizance of the hubbub and invited the speaker out.

When the recess was announced the harm had been done. Had the Vice-Presidency been a foregone conclusion, as was the Presidency, few spectators would have returned. Finding something good to eat at the off hour of three to four was doubted, and then there was the contingency of going dinnerless if one wished to witness the complete balloting for second place.

Why the rush? A President is chosen once in four years and may last eight. A ratio of one day a year would not be too much to ask, with due regard to the needs of delegates, who have to put up with hotel life, limited comforts and the like. What the majority of delegates wish to do of their own free will is something else, but from the standpoint of parliamentary procedure conventions are still too crude. There is too much steam-rollering from somewhere behind the lines.

There is too much bathos disguised as pathos; there is too much ballyhooing disguised as politics. There ought to be some parliamentary restrictions against these deviations from the business at hand. There is no necessity to invent martyrdoms, to confabulate about exaggerations, to quicken dying enthusiasm—or murdered enthusiasm—by trick use of the American flag, like a George M. Cohan comedy.

During the convention I heard the name of Theodore Roosevelt, as President, once only, and the applause was genuine; the genuineness was attested to by its volume, quickness and natural end. Why William H. Taft's name was heard in silence I shall not attempt to say. A flurry was occasioned at the mention of Lincoln, whereas a great deal of obviously milling applause followed the uttering of Harding's name. But what I should like to know is just what would have responded, in the way of applause, had Woodrow Wilson's name been mentioned by any one in connection with the war. There may be many answers to that—but most likely there would be one only.

But now it's all over, as far as that convention is concerned.

Cleveland did nobly, generously, conservatively.

In the end, however, will the little Cleveland girl who passed by the entrance "Q," reserved for us of the press, during a moment when the loudspeakers overhead were silent, ask again of her guardian:

"Mummy, when will Station G. O. P. broadcast?"

Pageantry or Firecrackers?

A Picturesque Way of Celebrating the Fourth

Group of pageant characters.

Group of characters in Fourth of July pageant.

Group in one of Miss Burr's masques.

By BYRON SHORT

HUNDREDS of persons gather on a college campus and powerful electric searchlights, placed in the upper windows of one of the old ivy-covered stone buildings, brilliantly illuminate the open space between the bleachers and a huge platform extending across one part of the circle. The pageant characters in their spectacular costumes are not professionals, but are chosen from the townspeople, faculty and college students.

In place of an announcer such as is found in a circus, a college student stands at one of the upper windows of the old stone building, a megaphone in one hand and a printed booklet in the other.

Everything is in readiness for the presentation of the second of a trilogy of Fourth of July pageants depicting the history of our country from the time of its discovery to the present. The director blows her whistle; the orchestra plays the prelude; the characters in their varied costumes take their places in the procession.

Such community plays are given each Independence Day on the campus of the Kansas State Agricultural College at Manhattan, Kansas. They are presented under the able direction of their author, Miss Osceola Burr, supervisor and director of pageantry at the college.

The first pageant of the trilogy was entitled "The Birth of Freedom"; the second, "The Symbol of Union" (The Story of the Great West); while the third pageant, which is to be produced July 4, 1925, will portray the history of our country from the close of the Civil War until the end of the World War.

The first of these Independence Day pageants was produced on the evening of July 4, 1922. There was such a demand for its repetition that it was reproduced on the evening of the following Fourth of July, 1923. Including the orchestra and chorus there were about 250 participants, all local. The pageant story was told by pantomime, singing and speaking. Each episode was preceded by the reading by the prolocutor of a portion of the pageant story, copies of which were in the hands of the spectators. The finale included the singing of patriotic songs by the pageant characters (grouped together on the immense platform), the chorus and the entire audience.

This pageant pictured "The Birth of Freedom" in the world, beginning with its origin among the Puritan men of Old England, where they were persecuted. The succeeding episodes followed this spirit of freedom down through the years, with scenes of Columbus, the Pilgrims, the Indians, and the social life of the colonies as shown by the "Minuet" and George and Martha Washington; leading up to the Revolutionary War, which was portrayed by such scenes as "The Continental Soldiers," "Betsy Ross and the traditional First Flag," "The Spirit of '76" and "Lafayette coming to the assistance of Washington." At the close of the Revolutionary scenes took place the presentation of Uncle Sam to the world by John Bull.

From the symbolic presentation of "Death" and "Martyrs" at the beginning to the closing patriotic songs, the attention of the audience was held by the beautiful and impressive portrayal of our country's history.

The Fourth of July Pageant for 1924 includes the epoch from the end of the Revolutionary War to the end of the Civil War. It shows the change in the meaning of the words "the Far West," as our civilization gradually spread westward. The pageant shows how at first "the Far West" meant west of the Alleghenies; then Ohio, then Missouri and then Kansas, each in turn; and finally how it came to mean the western shores of our continent.

The author has chosen for her sub-themes two of the ideas modern history is trying to instill in the minds of the younger generation; (1) the amiable attitude of England toward the United States from the time we became a nation; and (2) the fact that the Civil War was a tragic mistake rather than a necessity.

Although still a young woman, Miss Burr is one of the pioneers in the field of pageantry. She has had considerable experience in this line of work, having produced in all seventy-five pageants. About one-third of these were given during the World War for the purpose of arousing patriotic interest.

The pageants which she has written and directed in the last ten years cover a wide range, including, besides those of a patriotic nature, masques such as "The Spirit of Play," and religious pageants, such as "The Law of Service." The latter was produced last Christmas at the college and its presentation marks the establishment of an annual Christmas pageant production as a college tradition.

Recently Miss Burr wrote and directed a pageant entitled "The Awakening of the West" for the Kansas State Farm Bureau. The theme of this production, which required 2,000 participants, was the development of agriculture.

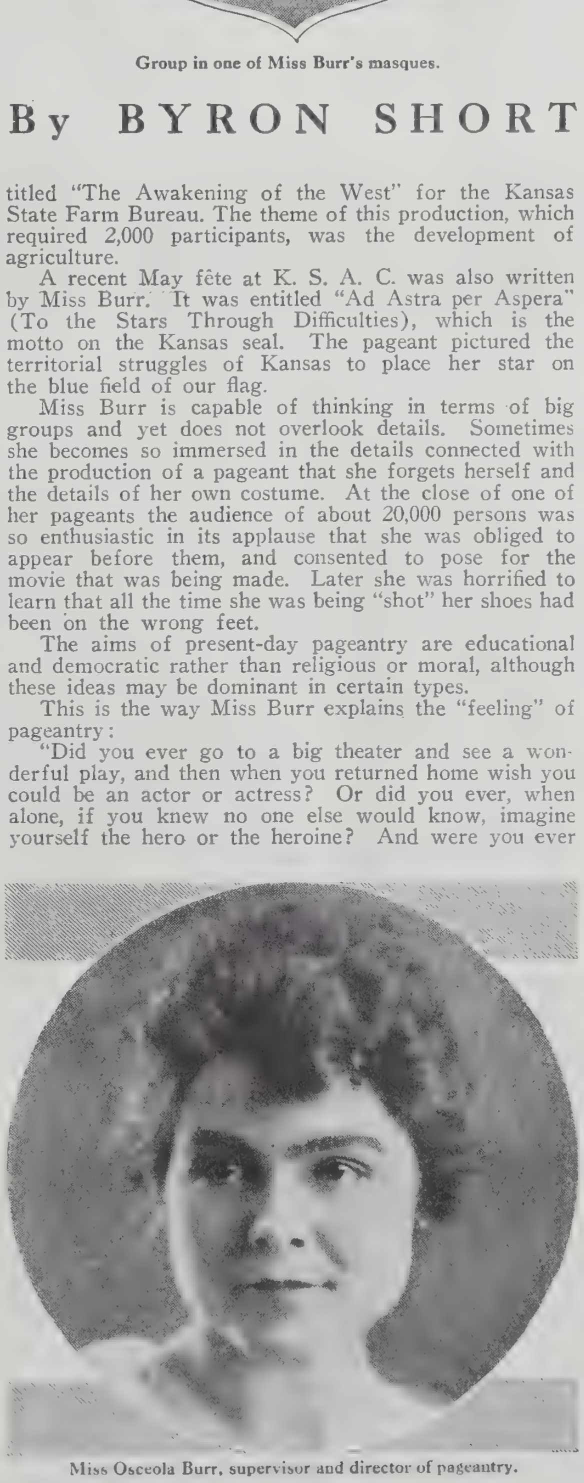
A recent May fête at K. S. A. C. was also written by Miss Burr. It was entitled "Ad Astra per Aspera" (To the Stars Through Difficulties), which is the motto on the Kansas seal. The pageant pictured the territorial struggles of Kansas to place her star on the blue field of our flag.

Miss Burr is capable of thinking in terms of big groups and yet does not overlook details. Sometimes she becomes so immersed in the details connected with the production of a pageant that she forgets herself and the details of her own costume. At the close of one of her pageants the audience of about 20,000 persons was so enthusiastic in its applause that she was obliged to appear before them, and consented to pose for the movie that was being made. Later she was horrified to learn that all the time she was being "shot" her shoes had been on the wrong feet.

The aims of present-day pageantry are educational and democratic rather than religious or moral, although these ideas may be dominant in certain types.

This is the way Miss Burr explains the "feeling" of pageantry:

"Did you ever go to a big theater and see a wonderful play, and then when you returned home wish you could be an actor or actress? Or did you ever, when alone, if you knew no one else would know, imagine yourself the hero or the heroine? And were you ever disappointed when you 'came to' after such an experience, because in your community really big plays were not produced? Yes, of course, you have done so. It is human nature to want to play a part.



Miss Osceola Burr, supervisor and director of pageantry.

"The last few years have seen the modern drama become so professional and commercialized that only those who follow the profession of acting are privileged to have the thrill that comes from creating and contributing to dramatic art. More recently, there has been a noticeable change, and dramatic expression is coming back to the people, where it originated. Home talent plays are contributing greatly to the fund of knowledge and dramatic experience of local communities. Drama, however, from a community standpoint, is scarcely big enough in its scope to include all the people, as drama is a form of expression in which many are called but few are chosen.

"With the development of community consciousness, and with the growing desire and demand for individual and community expression, there has been revived a type of dramatic expression that meets the recreational needs of all the people, a type that is democratic. This is community pageantry.

"Pageantry is primarily democratic—it is of, for and by the people. It is of vital importance to the entire community; it uses many persons and has no star performer; its actors are amateurs rather than professionals; and it shows its story rather than tells it."

One of the advantages of having no "star performers" is that the pageant can be produced even though several of the pageant characters may be unable to appear for its presentation. If necessary, "last-minute" substitutions can easily be made, since it is the costume and not the acting or spoken words which is of greatest importance. Two members of the group of "flame dancers" in "The Awakening of the West" became quite ill just before the performance, but the audience never realized their absence.

Although the actors are amateur, they often feel more genuine emotion when "acting the part" than would a professional. Especially is this true of the pageant character who happens to be a descendant of the historical personage whom he is representing, as was the college professor who played the part of William Penn in "The Birth of Freedom."

As an example of the community interest aroused, a small boy came to Miss Burr on the afternoon of the Fourth and asked if he too could "be in" the pageant. He might have spoiled the action of an entire group, but she wisely procured for him an Indian suit and told him to do just like the other children of the Indian group. The audience never knew of the "last minute" addition to the list of pageant characters.

A college professor or the most prominent citizen of the town is no more important than a college student or a child in a pageant picture. All participants are of equal value. The person "who wants to run things" learns to obey the commands of the director and to do just like the rest of his group.

Illustrating this community co-operation, the pageant committee for "The Symbol of Union" included persons from both the town and college. On it were representatives from the college departments of building and repair, electrical engineering, applied arts, clothing, history, journalism, and from the college class in pageantry organization; together with representatives from the Manhattan Chamber of Commerce and the Ministerial Association.

It has been said that, "the Hebrews gave to the world religion; Greece gave art; Rome gave law; Germany gave science; England gave literature; and America gave commercialism." Also, that "America would rather buy art than make it." But if the growth and demand for pageantry throughout the United States continues, it is possible that this will also become a national characteristic. Just as the Passion Play is synonymous with the name of the German town, Oberammergau, so pageants of a certain type might become definitely associated with various localities of our country.

"The old Fourth of July is passing away," said Miss Burr. "The noise, the confusion, the destruction, that went with the celebration of the old Fourth, is now frowned upon; and we are coming to realize that the expression of patriotism cannot be exploded by a firecracker. Many other communities, like Manhattan, Kansas, are finding through pageantry a worthy and safe way to express individual and community patriotism; the kind that makes so profound an impression that it is remembered longer than a single day."

The Soldiers' Home—Where Lincoln Stayed

Concluded from page 6

Barracks, U. S. Soldiers' Home, Sheridan Building.

Fourteenth street, to Fourteenth street, and to follow the latter into the city. One morning when the President was on his way from the home to the White House when he reached Fourteenth street he encountered an Infantry Regiment on the march. A number of regiments had been ordered into the city and the President was very much interested in their arrival. He stepped out of the barouche, not by opening the door, but by stepping over the door, and approaching a sergeant, said to him: "What is this?" The sergeant replied, "It is a regiment, you old fool!" This amused Lincoln very much. He made no reply, but returned, got into the carriage and proceeded to the White House. It is said that the President repeated the story several times during that day.

There are a great many interesting characters at the Soldiers' Home. For instance, there is E. A. Buck—who carves the Lord's Prayer on walking sticks. He has made and sold more than $2,000 worth of canes.

An outstanding character is George Campbell, the symbolic Uncle Sam, who always takes a conspicuous part in the many patriotic demonstrations in the nation's capital. Campbell was a drummer boy during the Civil War, and tells the following story of Lincoln: One morning the President called at the Mt. Pleasant Hospital in Washington, where Campbell was stationed, and was struck with the perfect time in which the drummer boys rolled out reveille. The President called the boys over and shook hands with each of them. Campbell settles the point as to which side of his head the President parted his hair. He says that it was parted on this particular morning on the left side. After the Civil War Campbell graduated from the medical college and practiced many years.

The home is equipped with a thoroughly modern hospital, and has ample facilities for the proper care and treatment of its sick. The physio-therapy building is considered one of the most complete of its kind in the country. The hospital has recently been enlarged and now has room for 500 patients.

The home is administered by a board of commissioners, of which Major-General Tasker H. Bliss, retired, governor of the home, is president, and the surgeon-general, the quartermaster general, chief of engineers, the adjutant-general of the army and the judge-advocate-general are members. Under the administration of the present governor (General Bliss) a great many improvements have been made.

The home experienced an unfortunate investment in the early days of its history. Just before the Civil War the board of commissioners invested its funds in the bonds of the state of Virginia. When the war came on this proved to be a very bad investment, and left the home in a state of temporary financial embarrassment. Congress later provided that such funds as were not needed in the current administration of the home should be left in the Treasury of the United States and that the Treasury should pay the home interest at the rate of three per cent on such sum. There is now in the Treasury of the United States, bearing three per cent interest, an amount approximating $3,000,000. The home can make no single expenditure in excess of $5,000, without the approval of the Secretary of War. Annually the home is inspected by the Inspector-General of the United States Army, and always measures up to the rigid exactions of the army.

Any account of the Soldiers' Home without reference to the dairy and the herd of Holstein cattle would be incomplete. The herd consists of 100 cows, 27 heifers, 4 bulls, and 85 calves. The Department of Agriculture tests it annually for tuberculosis and it has suffered no reaction for more than nine years. Every animal in the herd is registered, and out of the 100 cows in the herd 75 have received the advanced registration certificate of the Holstein-Friesian Association, the remaining 25 are now on test for yearly records.

The milk is used for the mess of the home, hospital and dairy; sold to officers and employes; fed to calves and used to produce cream and butter. The sale of stock from the herd is a source of revenue to the home. The calves command a price from $100 to $1,000 and the herd produces from seventy-five to eighty calves a year.

The herd is under the care of Dr. W. B. McGrath, who was born on the estate. He has had charge of the dairy for eighteen years. His father established the herd and had charge of it for thirty-five years.

Where East Is West

Concluded from page 10

Chinese and the Spanish worlds. The formal old mandarin, riding abroad on his donkey, says to an acquaintance who fares forth afoot: "I will get off and you shall mount." This, of course, means no more than "How do you do?" The Spanish-American, inheriting the phrase from his Iberian ancestors, says to a guest: "My house is yours." In either case an acceptance of the formulas at face value would be a profound shock to all concerned.

Fine phrases, however, are essentially Oriental. They come to the Spaniard from the Moor, and Chinese literature—even the colloquial speech—is filled with the verbal treasures of four thousand years. Rotund and mellifluous language rolls from the presses of the South-American newspapers, in Spanish phrase thick with adjectives and oily with personal enhancement.

Beneath such extravagance, of course, there is abundant room for those sly evils, guile and inaccuracy. The former is admired, in fact, by both peoples, and practiced with assiduity. In business it is a magnification of what used to be known as "Yankee shrewdness." There is one great Sinologue who, while confessing his general confidence in the business integrity of the Chinese, nevertheless sees in them a lamentable capacity for "duplicity, insincerity and obsequious accommodation to favorable circumstance." These are qualities that do not amount to a monopoly in any nation, but there are those who will be able to verify them easily in both Asia and South America.

The Moor seems to have passed on to his American heirs a good deal of his habitual disregard of accuracy. This, of course, is not so much a matter of wilful error as it is a deficient appreciation of the importance of facts. Most Orientals, if they do not know the answer to a question, will make up one. They are too polite to say, "I don't know." With the Chinese, this amounts almost to a talent. A coolie, answering the question of how far it is to a given point, is as likely to say "Far," or "Near," as anything else. Pressed for details, by some such further inquiry as "Ten miles?" he will give his smiling assent, whether he knows it to be twenty or forty. It is evident to him from the question that you wish it to be ten, and he would not for the world offend by making the distance appear otherwise.

"Straightforwardness without the rules of propriety becomes rudeness." This is the Chinese phrasing of another trait shared in common with the South American. It is the quality of indirection, of accomplishing matters of business, particularly, by flank rather than frontal attack. Commercial representatives have come to understand this well, and there are many droll stories of the intricate and circuitous rules of approach. Sometimes these are social, and have to do with a week-end, a dinner or a glass of vermouth; in fact it has often been said that an office in South America is more of a mailing address than a place for doing business.

To some degree this is a reflection of the general quality of mistrust manifesting itself in men of Oriental persuasion, not only toward their women but toward each other. The indirect method of business allows the opportunity of examining and perhaps of establishing the trustworthiness of the persons concerned.

A British diplomat is quoted as saying that "no South American will put his faith in another South American." This is a harsh judgment, and, perhaps more than is the case with other such generalities, is to be taken at a discount. Nevertheless, it can be adduced that in the industrial and commercial life of the continent there is a reluctance toward the formation of mutual stock companies in which South American capital alone is interested. Most of the railroad building, the development of natural resources, and the establishment of energetic commercial and industrial enterprises, has been by foreigners, and there is a lamentable record of failure among purely native companies, usually accompanied by a breath or a whole breeze of scandal.

Precisely the same tendency is to be noted in China, although both continents, in these latter days, show a trend toward emancipation from it. Young China seems to be catching from the Anglo-Saxon his spirit of coöperation. Perhaps the best evidence lies in the somewhat exaggerated penchant of Chinese students toward organizing strikes and boycotts for the promotion of their variously advanced ideals of democracy. And in the university strikes of the Argentine there is an approximate parallel.

More of the spirit of *mañana* than it deserves no doubt has been attributed to Spanish America. Yet that continent has a liberal inheritance of the "do it tomorrow" philosophy, particularly in the sedate and somewhat old-fashioned region of the Andean ridge. Time, to the Oriental, is of no great account. And in the sleepier of the American republics the Yankee is likely to be admonished: "Don't hurry. Some one will think you are busy."

Things are not likely to get done until tomorrow in either China or South America. Neither social nor business engagements are made to be kept—punctually. This negligent conception of the value of time can scarcely be understood by the Anglo-Saxon. To him eternity is no more than a period of years; but the Oriental mind is able to conceive of it in larger terms, by saying that when the Himalaya Mountains have been ground to powder by allowing a gauze veil to float against them once in a thousand years, eternity then will only have just begun. Upon such a premise, why worry about being an hour late for an appointment, a day late with a promised achievement?

No matter what the pressure of affairs, the Chinese has time for his tea, and the South American for his meals or his *maté*. This latter is by no means universally used, but it has long been almost as much of a national beverage in Argentina and Uruguay as tea proper in China, and there are devotees even in the high Andes and along the western slopes. Around the use of both there has grown an exacting ceremony. Both are social integers of vast significance. Over the *maté* bowl, as over the teacup, take place discussions lasting for hours or for days, around and about a subject that would be disposed of by an Anglo-Saxon in as many minutes.

Just as time is of little account, so is life cheap. The economic position of the Indian is that of the Chinese coolie. Both are enmeshed in a bitter struggle for life, and both are tinged with a stoicism and a fatalism that drift over imperceptibly into the more fortunate classes. The aborigine, even the peon with a liberal mixture of European blood, works stolidly and doggedly, with an almost cheerful acquiescence in toil as a necessary part of his destiny. And so it is also with the Chinese laborer, at home and abroad. "It is the will of heaven," sighs the Chinese; "It is written," laments the Moor.

The filth of the beggars suggests another parallel. To neither China nor South America is the bathtub overfamiliar. Chinese mistrust the use of water in any other way than when poured, at a boiling temperature, upon tea leaves, and the aversion of the Andean Indian to its use upon his body is just as acute. But men of Cathay have no such fundamental obtuseness to dirt as the Indian, who more nearly resembles, in this respect, the Arab or the Moor.

The pariah dogs of Cathay have their pitiful counterparts in Peru—both victims of a certain callousness to the sufferings of beasts. The Argentine's cruelty to animals has frequently been a subject of comment, and even the Chinese, despite his Buddhist law of gentle kindness to all living things, appears to have as little heart for dumb creatures as for the miseries of his own kind.

The number of minor similitudes linking South America with the East might be multiplied, through the requisite ingenuity and observation. Reference might be made to the propensity for gambling, powerful alike in both Don and Chinee; or to the occasional long finger nail, symbol of aversion to and fortunate exemption from manual toil, which is to be seen in South America as well as in China, if the tales of intimate travelers are to be believed. There is many a small likeness, too, in such matters as the religious processions, the scent of garlic, the atmosphere of village streets, and the terraced gardens and farms; in "squeeze," which is Chinese for graft, and in the rarity of the fixed price for retailed commodities; but since no point is to be proved, the collection of such data, valuable, if at all, only as amusing coincidence, should be brought to an end before it reaches any such proportion as to arouse retort from Spanish America's ethnological cavaliers.

Mr. Sapiro Speaks for Himself on Witness Stand

Concluded from page 3

If you had been asking me this specific question, I would have said, "That means, to their full extent, so as to give full measure of service."

Q. You think they would still be able to operate? You think they would be able to operate in Manitoba and Alberta, or Alberta alone? A. Yes. They will do some good.

Q. They would do some good? It would be better for the farmers then? A. Than individual dumping.

Q. Don't let us call names to any of these things.

A. That is not an abusive name. That is always used in the trade.

Q. It implies an idea I want to get away from. Under the present contract market system even a pool in Alberta, without the co-operation of other pools, would be better for the farmer than the present contract system? A. Than the present contract system. Yes. That is correct.

Q. Have you given thought or attention to the question whether the idea of the five years' contract plan is a necessary and essential ingredient of the pool plan?

A. Yes. I have given quite a bit of thought to that.

Q. Is it, or is it not?

A. Without a long term contract there is not a chance for a pool making good.

Q. So, it is a necessary element?

A. I might give one illustration there. It will probably show you, in answer to your first series of questions, just how the facts are. We have often discussed with the bankers the possibility of a market falling through overnight by some extraordinary chance which no one foresees. In that event, their collateral would be in jeopardy. They would have to take over or sell that collateral and the association would owe them a great deal of money. *The only way then for the association to pay back the money to these bankers would be in the fact that they had three or four years more to operate under their contract* with the farmer and in that way, if there be a loss in any way from some calamity, you still have those other years in which you can make that up. The bankers in the United States feel that that one factor alone is enough to take care of the particular chances you were asking about at the start of this hearing. . . .

Q. It is not a *voluntary* pool under which the farmer *binds himself* under *contract?*

A. Yes, voluntary refers to the farmer being willing to bind himself by his own will.

Q. Will you tell me what you have in your mind as *the force that is going to make the farmer hold to his contract*, if it is not his own sense of duty to his fellows and his desire to stand with his own people and do what he would do if he had not signed a contract? A. Now here is what I would say first of all: We have found in the co-operative Market Association that whenever an association is formed it takes the place of someone already in the trade. Therefore, those men who are already in the trade and who are bound to have both their business and profits reduced, fight co-operative. Therefore they do all kinds of things to induce the farmers not to deal with the co-operative . . . .

Q. You quite understand you are not answering my question. I simply wish to know what you regard as the sanction, *the force, behind the contract? How are you going to enforce it* against a person who is disinclined to continue?

A. We rely upon *the co-operative spirit* for procuring the signature to the contract. When once the contract is secured, we rely upon *the contractural terms* and if a man is induced to break his contract we proceed exactly as you would under any contract. *We go into the courts and procure enforcement* of those contracts.

Q. You go to the courts of the land to make this person—

A. Who has breached his contract. We make him keep the contract.

Q. Do you look to suing him for breach of contract, or do you look to suing him for specific performance of his contract? A. The United States have courts of different jurisdiction—

Q. You know enough about Canadian law to answer that question. A. Yes. Just a minute—

Q. What would you do here if you were up there in Saskatchewan?

A. We provide in that contract for both remedies. We provide for liquidated damages at so much a bushel on all wheat which has already been delivered outside. In addition to that, we ask for equitable relief in the line of specific performance of all unexecuted parts of the contract. *That is put in the contract.* The man agrees to that particular kind of relief and there has been as yet no decision in Canada which makes any of us feel that we cannot get the same remedies applied here that we have secured in the United States.

Q. Then the parties would get the real damages, would they not? A. I hate to disagree with a fellow lawyer, but in this case you cannot prove the real damages, because the association has not agreed to buy at a specific price.

By the Chairman:

Q. The difficulty would appear to be this, from a practical point of view. You take any given district this year, let us assume for the sake of argument that unfortunately the pool farmers receive less for their grain than the other farmers do; you know the effect of that? A. You mean a lot of men might break the contract?

Q. Now take any given area that fifty per cent were in the pool and fifty per cent were out of the pool. Suppose it happens that those in the pools get a less return, that is discouraging, isn't it? A. Yes.

Q. The next year a great many might be induced to say, "This pool is no good. I am not going to live up to my contract." They start selling their wheat outside of the pool. Now, are you going to get after each and every one of those farmers? A. Well, that is a question of policy. As a rule, your breaches are very few, because, as a rule, farmers regard these contracts as fairly sacred. They know it is their only chance. In some instances, one I have known, in the tobacco companies, they went around and they offered to the farmers who would settle outside the pool, perfectly enormous premiums on their tobacco, and in some instances they offered those farmers ten to twelve cents a pound over and above what we are trading tobacco for. . . . There were several hundred men out of about 90,000 who did break their contract . . . . *In those cases we sue, and we would sue in those cases, even if it ran into the hundreds of suits. As a matter of fact, in that territory, in that tobacco association, we have 400 suits filed against men of that type, but that is about 400 out of 97,000 members.* . . . If for any cause we were to get to the point where the vast majority of them did not want to co-operate, did not want to continue, then in that case we recommend dissolution of the co-operative.

This is the first of two articles on this subject. The second will appear in an early issue.

The Trial of Bishop Brown

Concluded from page 9

Bishop Brown could not have been successfully prosecuted in the diocese of New York. Dr. Grant has made as fundamental a challenge of the Christian doctrine as Bishop Brown could possibly make. Bishop Brown is at the same stage of development as Dr. Grant. Neither is an advanced mind; not even an up-to-date mind. All of us know what Bishop Brown means, for example, when he says he cannot believe in an objective God: he means a Being who sits in the form of a man somewhere in the skies. Inability to believe in this is sometimes expressed as repugnance to the idea of a "personal God." People commonly say that they do not believe in a "personal God," when they really mean a God in bodily form. Personality, many think, is too narrow a term to apply to Deity, since it is applied to humanity. The question might as well be put, whether it is not too great a term to apply to man. For what is greater than personality? What could Deity have that is greater than personality? What is personality but the combination of will, purpose, intelligence, direction, power? To deny these to Deity is to make Him lower than humanity. People deny personality to the Godhead because they imagine it is too little; did they but know what personality is, they would see how godlike it is wherever it exists.

What about Bishop Brown's alleged Marxism or communism? Does the New Testament teach communism? I must confess that I once thought it did. Indeed, a great deal of time is spent even today disposing of certain passages in the Book of the Acts of the Apostles. Strangely enough, it was an article in THE DEARBORN INDEPENDENT which called my mind back again to the matter, though at first I was inclined to pooh-pooh the position that the New Testament did *not* teach communism. But I went back again to the Greek and studied the matter more closely, and to my great enlightenment I found, even as the article had contended, that Acts 4:32 ought really to read: "The whole body of believers was in complete accord, and not one of them said any of his possessions was his own singly and alone, but everything was for the common good."

That doesn't do away with what we call private ownership, but it does deny the right of any Christian man to hold or use his possessions for selfish or anti-social purposes. It is for the common good. Marxism, of course, has no resemblance to this high social-mindedness. Marxism is just another kind of materialistic slavery—the very thing from which the Gospel represents the first Christians as emancipating themselves.

It is easy to see that Bishop Brown, in spirit, means just what Acts means; but the first terminology he found to express it was Marxian—hence the misunderstanding.

Bishop Brown himself practices private ownership, but also holds property for the common good. He has turned part of his homestead into a hospital for the community and whatever church councils may say as to heresy of his opinions, his townsmen declare that the evil has never touched his heart.

It is very clear from utterances of our so-called "heretics" and "heresy hunters" that part of their difficulties is a mere matter of terms, and part is a mere matter of temper.

Sir Walter Scott in His "Malachi Margrowther's" Letters

I assume, without hazard of contradiction, that banks have existed in Scotland for nearly one hundred and twenty years; that they have flourished and the country has flourished with them; and that, during the last twenty years particularly, the notes, and especially the small notes, which the banks distribute, supply all the demand for a medium of currency. This system has so completely expelled gold from Scotland, that you never by any chance espy a guinea there, except in the purse of an accidental stranger, or in the coffers of the banks themselves. But the facilities which this paper currency has afforded to the industrious and enterprising agriculturists and manufacturers, as well as to the trustees of the public, in executing national works, have converted Scotland from a poor, miserable, barren country into one where, if nature has done less, art and industry have done more than, perhaps, in any other country in Europe, England not excepted.

"Enemy Citizen" Worse Than "Enemy Alien"

Concluded from page 4

use and meaning of such phrases as "play the game," "buck up," "a square deal," "be a good fellow," "put it over," "cut it out," and so forth, are bound to have their motives and emotions molded toward fundamental Americanisms. The constant use of fresh, virile language helps to make vigorous, alert, resourceful citizens of repressed subjects.

It is of vital importance that we teach adults in America to understand and use one common language. We should not wish them to remain deaf and dumb, or "dead," in the midst of the common language-life of our nation. A nation which is ruled by the votes of its citizens, and has so large a per cent of adult illiteracy as has ours, has no reason to be sitting down on the job. Rather, why not attempt to formulate and use the best methods of bringing a new language as quickly as possible to the alien adult, always sensitive and conscious, and usually fatigued? This is a field of education worthy of the best efforts of capable educators. It is one of the fields of Americanization.

A third factor in assimilation is *a common citizenship.* One cannot be completely Americanized unless he is an American citizen. One of the most important causes of America's past success in assimilating her vast numbers of immigrants is citizenship with its duties and privileges. Every man now coming to the United States knows that in time he may become a part of this young, successful nation to which he has come. And though voters are herded in places at times, an immigrant citizen or prospective citizen is much more likely to be alert and responsive to the best conditions in America than an alien would be in a country which he had adopted but which would not reciprocate.

A common education is one of the most important factors in assimilation. The children of the foreign-born are molded in the public schools, but when it is remembered that our child labor problem is largely a problem of the child of the foreign-born, that more than ninety per cent of the children of our foreign-born population leave school at the age of fourteen years and that many thousands have only imperfect schooling before that age, we realize that the public schools alone cannot solve the problem. Moreover, the whole question of the constructive education of the adult, beyond the matter of language study, is an open and most important one.

Educational Facilities Wanted

A MATURE and intelligent alien said to me, "I have been twelve years in America, and in that time I have never come in contact with a person or any agency who consciously tried to teach me anything. All I have learned has come to me by my own reading." Another, a graduate of an agricultural college in his native country, said: "America is a queer country. There is no chance for a man to learn anything here. At home we have clubs, forums, and debates. Here there is nothing to do but earn money."

Probably in no other nation are its people so largely molded into form by the public press as in America. So one of the most vital needs of our nation is a press genuinely "free" from dictation and control by propagandists of un-American interests. A race is being run in America between certain destructive forces and certain constructive forces, both striving to educate the alien. This race seems to be a comedy to some, but it requires no particular gift of higher intelligence to realize that it may be a national tragedy, if the aliens are not reached and commonly educated to the best constructive thought and emotionalism of America.

The fact is that America is essentially Christian. Americans have had so many things "in common" in their religious life, or, to put it another way, so very few things not in common, that the disadvantages of diverse religions within a single nation are difficult for us to conceive. The religionist finds scant cause for belief in serious friction in America even in closest scrutiny of her present horizon. The protracted persecutions and deadly wars of Europe within the so-called Christian faiths, and between Christianity and Mohammedanism, help us to see more clearly the assimilating factor of our common religion. Personally, I am confident that America has in her common religious life an important factor contributing to the assimilation of her aliens.

Americanization in the minds of the many of us who are American enough to profess to believe in it means assimilation.

But Assimilation does not necessarily require thousands of years or even many generations. Those who say it does have *confused assimilation with amalgamation.* As has been seen, assimilation is psychic. Amalgamation is physical, is purely biological, is a matter of interbreeding—or, as we say, a matter of intermarriage. Amalgamation between peoples begins with the first generation of children born to parents of dissimilar races or ethnic groups. It is completed only when the members of any generation of such interbreeding peoples have become physically stable, and any one offspring of that generation is typical of the whole group. Assimilation in America may be very rapid; amalgamation in America must be very slow, and, further, is not necessary for Americanization—though, in the far distant future, it seems inevitable for all assimilated persons.

Assimilation, we repeat, is not necessarily a matter of many generations. It may be very slow; it may be relatively rapid. There are factors determining its rate of progress. They are at the service of our nation, and we shall be stupid if we do not make wise use of them.

BRIEFLY TOLD

Russia has again gone into the egg business. Before the war eggs were among the most important of Russia's exports, the 1913 exports amounting to 3,484 milliards of eggs, or sixty-four per cent of the world export.

In Rock Island County, Illinois, where the Indian took his last stand east of the Mississippi, a memorial park is to be established. The park will cover part of the scene of the Black Hawk wars.

Probably the most curious restaurant in the world is in Buenos Aires. The equipment consists of one large pot about a yard in diameter, and one large fork with which the customers, for the sum of five cents, are allowed a chance of fishing out a chunk of meat.

The black bass guards its young after hatching, and is the only fish distributed by the New York conservation commission known to do this.

The British authorities are arranging a fake art exhibition with the object of warning American and other tourists of the difference between genuine works of art and fake copies.

The famous Derby race was founded in the eighteenth century by the Earl of Derby, and after 130 years' effort on the part of his descendants, it has at last been won by the present earl.

The central incinerator of the city of London, England, is to be harnessed to a power station, which will generate electricity for the lighting system and the running of tube railway and surface cars.

The discoverer of the possibilities of gas for illuminating purposes was Philippe L. Lebon, a French engineer of the revolutionary era, who was murdered in 1804, presumably by burglars who had entered his house at Versailles.

Ceylon is very nearly the size of Ireland. It is a separate political entity, possessing its own constitution, legislative council, and governor. It is expected that the total value of its merchandise trade for 1923 will be upward of $20,000,000.

The native population of South Africa, which already outnumbers the whites by three to one, is growing at a much more rapid proportionate rate.

Tourists spent $136,000,000 in Canada last year.

The common shrew is smaller than the house mouse, and is one of the fiercest and most indomitable of creatures. The lion is a cowardly skulking brute beside this wee atom of fur and vitality that is called the common shrew.

On a small field of about two acres, there was recently made the largest find of sapphires ever recorded in Ceylon, the gems including yellow, gold, purple and blue stones of 20 to 700 carats, some of them weighing as much as half a pound.

The largest and most nearly complete library of strictly educational literature in America is maintained by the United States Bureau of Education at Washington.

In Quebec, Canada's oldest city, taxicabs have just made their first appearance, taking the place of the quaint horse vehicle called the caloche, so familiar to tourists.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The *Lion,* which was Admiral-of-the-Fleet Lord Beatty's flagship during the war, is in the hands of the shipbreakers at Jarrow-on-Tyne.

"Liberty is far more easily destroyed by those who abuse it than by those who oppose it."—*Ramsay MacDonald.*

The consumption of wine reached such a high point about a thousand years before the Christian Era that Lycurgus, King of Thrace, passed a Prohibition Act, the thoroughness of which cannot be questioned. A strict abstainer himself, he forbade the use of wine to his subjects, and rooted up all the vines within his dominion.

Russia has purchased between $35,000,000 and $40,000,000 worth of cotton in the United States since the first of the year.

Gaston Doumergue, the new president of France, is a Calvinist, which is similar to being a Presbyterian in the United States.

The collection of eleven hundred or so of the original certificates of marriages celebrated by John Linton, the Gretna Green blacksmith, between 1825-1854, each signed by the contracting parties, has been sold in London to a private collector for $1,400.

All men and women alike in Great Britain who attain the age of twenty-one are now entitled to the parliamentary vote.

Forty-two per cent of the telephone equipment in South America is in Argentina, and the total line length represents fifty-one per cent of South America's total.

Large stone slabs which formed the core of the Roman roads in England were in medieval times frequently carried off for building purposes. The using of these ancient roads as quarries accounts for their disappearance in many districts.

Three natural rock bridges of great size and beauty, occurring within a few miles of one another, near the head of the White Canyon, are included in the National Monument in San Juan County, Utah.

Jews immigrating from Russia and other parts into Constantinople are alleged to be buying up at low prices banks, building land, and blocks of dwellings whose former owners have had to leave the country.

The house of Nance Tinnock, who frequently acted as hostess to Robert Burns, has been opened at Mauchline, Scotland, as a home for the aged poor.

A silver penny of the days of Edward I (1272-1307) was found recently on the top of Large Law, a hill in Scotland.

During the past three months of this year the police have discovered in the province of Saratov, Russia, more than 5,000 secret stills and 3,500 gallons of homemade spirits.

Sir Arthur Conan Doyle was born in Edinburgh and Richard Doyle, the famous *Punch* artist. was his uncle.

The house formerly occupied by Keats, the poet, in Hampstead, is to be taken over and maintained by the local borough council.

Sliced raw potatoes delight the elephant, the rhinoceros, and the hippopotamus. Monkeys have also a weakness for potatoes, but they must be well cooked and "floury."

The honorary secretary of the British War Graves Department says that the original wooden crosses from the war graves of France and Flanders can be claimed at the cemeteries by relatives of the fallen men, when permanent headstones are erected.

John Edward Brown, president of "Brown College," bought the city of Sulphur Springs, Arkansas, recently. Brown College is a "pay-by-work" school and Mr. Brown has ruled that every form of modern jazz must go. That means jazz in dancing, in music, in literature and in dress.

Thursday is the weekly school holiday in France.

There are approximately 52,000 post offices in the United States, or one to every fifty-eight square miles. In most foreign countries there is a post office to every two or three square miles.

The United States has no national flower.

Wet leather, dried by heat, is practically worthless, according to tests made by the United States Bureau of Chemistry.

Every native American Indian in this country becomes a citizen of the United States, under the new Indian citizenship act recently signed by the President. The granting of citizenship does not remove the restrictions on Indian lands under government guardianship, the Supreme Court having held that wardship is not inconsistent with citizenship.

A kauri tree has recently been discovered in the New Zealand bush which rises to a height of seventy-five feet to the first branch and measures twenty-two feet in diameter or about sixty-six feet in girth. It is estimated to contain more than 195,000 superficial feet of timber.

One of the most remarkable literary finds of recent years has taken place in London. A casual book collector was turning over some dust-laden bundles in a small bookshop when he stumbled upon a portfolio of letters, notes, and prints, relating to Lord Nelson and Lady Hamilton.

CHRONICLER OF THE NEGLECTED TRUTH

Imagine "Helmaria" Dawes Running Senate!

T. R. Tried It Once, But the Icy Courtesy Froze Him Up

By A. R. PINCI

NINE hundred twenty-five one thousandths of the fame attaching to General Charles Gates Dawes is very recent, dating back little more than three years. As a result of certain exclamatory punctuations accompanying his testimony before a committee of the House of Representatives investigating the conduct of the war, he was widely advertised thereafter as "Hell and Maria" Dawes. Then, for the sake of brevity and perhaps also of good taste, he was nicknamed Helen Maria, like some foreign potentate who boasts a dozen or so feminine monickers.

One of the first things he did after his nomination as Republican candidate for Vice-President was to correct the biographers by pointing out that what he said was "Hell Maria," and that he used an expression not at all his own, but which was commonly used in many sections of Southern Ohio. According to one newspaper correspondent, he characterized "Hell Maria" a "d——d good expression," made doubly so by certain war circumstances which he wished to portray orally. Hell and damn are two perfectly good words and he uses them not unnecessarily but convincingly. If an enterprising reporter quizzed him about it, I am sure General Dawes would deny that preachers are the only individuals entitled to the free use of those vocables. General Dawes is the kind of man who will use anything that is useful.

There was talk, within fifty hours after his nomination, that he would become the brilliant crusader of the campaign; that the teamwork with President Coolidge would be so apportioned that the latter would make occasional speeches of the front porch sort, ably followed by others to cold but dependable "Mikes," the inert metal microphones that surpass anything heretofore known as messengers, whereas General Dawes would helenmaria the country to the best of his elocutional ability, plus the aid of a pipe which cannot long stand the onslaughts of combined puffing, biting and skywriting. (Dawes' pipes are bought by the gross.)

Dawes Pipe and Coolidge Stogie

GENERAL DAWES is a new type of sky-writer. When he takes his fumant pipe in hand, and in the course of remarks gesticulates to and fro, he does on a small scale what aviators do on a big scale and many careless chauffeurs—so avers the police—do with their motors on a medium scale. The Dawes pipe is a fitting companion to the elongated, elephantiac cigars that Calvin Coolidge predilects. The two together, by dint of their respective brands of silence, can add to their impenetrability of thought by their combined stogie-pipe smoke screen.

But those who hold the growing expectancy that Charles G. Dawes will be a sort of talkative Johnny-on-the-spot of the Republican team will be disappointed. Dawes is not going to be a political pooh-bah to be called on for entertainment whenever a political assemblage wants to hear words and nothing but words. Helmariaing is the sole elocutionary extravagance indulged in by him. Otherwise he is like the Vermonter who is making silence famous. If any one entertains the hope, which certain newspapers have fanned, that Dawes will spill the beans, that he will let the cat out of the bag, that he will tell tales out of school, I venture right here and now to blast it. He is one of the most "untalkingest" men that ever crossed Washington streets, and despite appearances and reports to the contrary, this city is criss-crossed by many such.

Helmaria's side of Dawes made him a public figure in a popular sense, but his fame has been added to as the result of the committee bearing his name which in about a hundred days sought to suggest a satisfactory solution of the German reparations question. What was undertaken between last January and April is universally known as the "Dawes report." Unfortunately, this report was hastily acclaimed as the ultimate panacea and the impression gained in many respects that he, and his coworkers, had wrought an economic miracle; that if it failed it would be due to the Germans denying its authenticity. In endeavoring to rally public opinion behind it an erroneous conception followed, as it was not made clear that the principles it embodied might differ from practicableness. Dawes, the super-economist, by helmariaing and smoking enough, has been said to have achieved the reparations settlement victory which so far eluded all the statesmen and "experts" assembled to adjust it.

As a matter of fact, General Dawes made a survey and nothing more. He reported a plan, but all plans have probabilities as well as possibilities, as well as their antonyms, and like a good soldier he did his duty. He was not requested to bring to book the various dissenters nor to enforce compliance with his findings.

Points of Order, or Order, Which?

THE Dawes nomination has disturbed Washington more than a little, and the disturbance has been in connection with his term as president of the Senate of the United States, which job is supposed to be the one to have made the Vice-Presidency so "unattractive" as public office. It is not a voiceless job, because the Chair must be constantly on the alert for parliamentary technicalities, and it is not a listless office because there is an immense amount of listening to be done, as well as a little listing on the side. The listing, by the way, means taking mental notice of those who talk too much.

As of today, it is decidedly difficult to conceive how General Dawes will fit in the Senate as its chief officer. As I see it, he will fidget about as much as a healthy two-year-old strapped down to his high chair, with this difference, that the baby can yell to his heart's content, whereas Vice-President Dawes will be obliged to clench his teeth, stifle a cry and still his hands.

Taking the Senate as a venerable, circumlocutory, periphrastic, aeropagitic, cunctative body, and taking Charles Gates Dawes as an impatient, unprocrastinating, direct, mercurial individual, once they are face to face, what is likely to happen?

Will this be the sort of report to be read in the *Congressional Record*, page 333, December 22, 1925:

Mr. Shouter. Mr. President—

The President. Does the Senator from the District of Columbia yield to the Senator from Hollerwood?

Mr. Skoopis. I do for a question.

Mr. Shouter. Mr. President, the Pawpaw tribe in the South Sea Islands are being discriminated against because the cocoanut tariff rates—

Mr. Skoopis. Mr. President, I did not yield for a speech. If now is the time for all good men to come to the aid of their typewriter—

Mr. Zuzzlerly. Mr. President, a parliamentary inquiry.

The President. The gentleman will state it.

Mr. Zuzzlerly. Under Rule MMMDCCXXXIII, Section 432, a distinction is drawn between typewriters, and I beg to call the Chair's attention to the fact that the machine follows, and does not precede, the queen of the species that presides over it or in front of it. Now, according to Fore's precedents—

Mr. Skoopis. Mr. President, a point of order.

The President. The Chair wishes to remind the Senate that so many inquiries, so many parliamentary tactics, and so many points of order serve to create nothing but disorder. (Bang!) The Chair prefers fewer points of order and more order. (Bang bang—brscrck!) It is now five o'clock and after sitting since noon we have not accomplished three words of legislation! The Chair sees a taxpayer in the gallery who is asleep. It is contrary to the rules, but the Chair rules he must not be disturbed. It shows he is healthy and his conscience is clear. When the rules interfere with business, drop the rules; when the road is too long from here to there take a crosscut. The Chair is obliged to warn Senators that rules which consume time and get us nowhere will hereafter be disregarded. Helmaria, proceed.

Mr. Brawdge. Mmmm— (but he faints).

Or will it be something like this?

Scene: Marietta, Ohio. Time: June, 1926.

"Charles, it can't be you!" exclaims his sister, Mrs. Beach. After a pause: "How you have changed! And where is your pipe?"

"Gave up smoking long ago."

"Why?"

"The Senate wouldn't let me."

"Charles," Mrs. Beach would cry in amazement, "do you mean to tell me that you let that Senate tell you what to do?"

Two Masters Impossible

"NHUH, it can't be helped, sister. If you were Vice-President a few minutes you'd know that what they have done to me is nothing. I think they have been very kind with their parliamentary rulings. It's a wonder that one of these days some Senator doesn't send a dozen persons to the gallows in the District jail. I learned to let them alone now—and as for the rules—"

"Couldn't you helmaria them?"

"No. They helmariaed me."

That is the chief topic of conversation these early campaign days. Those who know the Senate bet on the Senate; those who know Dawes bet on him. But be that as it may, the fact is that one or the other must be toned down, because there cannot be two minds, two masters, two goals. Whether one's helmarias will vanquish the other's points of order, or the other way about, is the latest exquisite gossip. That a *modus operandi* will be found, by which one will retain his ejaculatory term and the other its hoary technicalities is not considered.

In a way it may be said that what the Senate really fears is a master mind in the chair. Of course, rules and procedure cannot be changed without the Senate's consent, but it is admittedly true that a forceful executive officer who is not averse to a little publicity and a little criticism—in this respect Helmaria Dawes is *it*—would have no trouble in influencing a change. Now, the Senate, or a good part of the Senate, appreciates this contingency, and for that reason a few of those supposed remnants of the old oligarchy are assuming the defensive. The Senate is smarting sufficiently, generally speaking, from the criticism to which it has been subjected more or less regularly for a few years, since the old bosses passed to the beyond. A presiding officer with punch, pep and a following, who takes the job because he wants it, which he regards as something more than a niche in a living statuary political museum, can exercise a great deal of freedom and that freedom is there for him to take it.

Predictions are always of doubtful value, but it would not be surprising if with a Dawes at the head of it the Senate did not decide to give the Vice-President a voice in the chamber. It is immaterial that the Constitution deprives him of a vote, since he is entitled to it in case of a tie; a tie vote is the kind that would appeal to Charles G. because of the excitement this division would involve.

In the event of Republican victory and his transition to the executive dais Mr. Dawes faces two possibilities: that of patiently sitting as a neutral listener without voice (except to groan inwardly) or to retire to the privacy of the sumptuous but nevertheless glacial office provided for him.

Which of these alternatives will the hardy, vigorous, irresistible Dawes choose?

The general will want to be something more than an innocent bystander, even though he has the privilege of doing it sitting down in a chair, which, if made to measure, was intended for a Vice-President a yard wide at his hips. Why the Vice-Presidential chair is not like the Presidential chair, as to size, height and contour is one of those mysteries that will remain unsolved.

Of course, Senators address the Chair, and Vice-Presidents refer to themselves, for Senate purposes, as the Chair, but I doubt that General Dawes will want to be known hereafter as the Chair. Chairs are made to sit on and General Dawes isn't to be sat on. If so, the precocious sitter will know it. He is going to be Dawes, all Dawes and nothing but Dawes.

A Problem in Efficient Production

AFTER all, much of the negativeness of the office in question has been a state of mind. It began with the nomination and ended with the next. It has been a political exile, and during this interim of indifference and stay-putness the legislative branch has proceeded to ostracize the Vice-President to the point where nothing but his Chair remained. Now the tendency is the other way, and as already indicated, the Senate is somewhat disconcerted.

True, Theodore Roosevelt did endeavor, upon sitting in the Chair the very first time, to *hasten* the Senate into action and speed, but was promptly checkmated, and not without admonition, whereupon the aggressive future President calmed down. But those were other days. T. R. had been made Vice-President to shelve him politically, and the Senate's snub was intended to clinch the plan. There were bosses in the Senate then, and William McKinley was not a boss. Today there are no bosses in the alleged august chamber.

What Roosevelt could not engineer Dawes might.

It must not be assumed that Helmaria Dawes is revolutionary. Anything but. He is a most conservative, self-centered individual. He differs from most conservatives in this—that he has the courage of his convictions together with a penchant for driving them through. He differs from Calvin Coolidge to the extent that the latter is willing to wait until the Senate's will is done, while he is apt to grease the skids.

None is so jealous of the dignity and traditions of the United States Senate as Charles G. Dawes. He would be the last man to dim its glory or obstruct its basic deliberative duties. As president of an important Chicago trust company he appreciates the necessity for caution. So the problem of Dawes and the Senate dwindles to whether he can and will devise a formula by which fewer "Mr. Presidents" may be indulged in and more work done in a given time.

It is not generally known that Charles G. is a musician. He writes music. He believes in his own compositions, says so, and the fact that Kreisler played one was not an honor; it was a confirmation of his judgment. In other words, Kreisler didn't do him a favor by playing it any more than Dawes did him a favor by composing it. Dawes believes in his music as he does in his banking and his hobbies.

General Dawes is a man whose economic station in life has been kindliest, but life has not been without poignant sorrow. Traces of it are discernible; the practiced eye can not fail to perceive them. Nearly twelve years ago Rufus Fearing, his only son, then twenty-one years of age, was accidentally drowned at Lake Geneva, northwest of Chicago. General Dawes had sat up the night preceding the funeral to prepare a biographical sketch of his son, which he intended to read in place of the eulogy, but the task proved too much for him. He broke down and the officiating clergyman finished reading it.

His Public Life a Record of Action

HE IS the guardian of two children, Dana, twelve, and Virginia, ten, whom he and Mrs. Dawes adopted, and the trio is the source of his most cheerful hours. His pipe comes next. Then comes his business. Then his music. Then his story about a forefather of his who assisted Paul Revere in his ride.

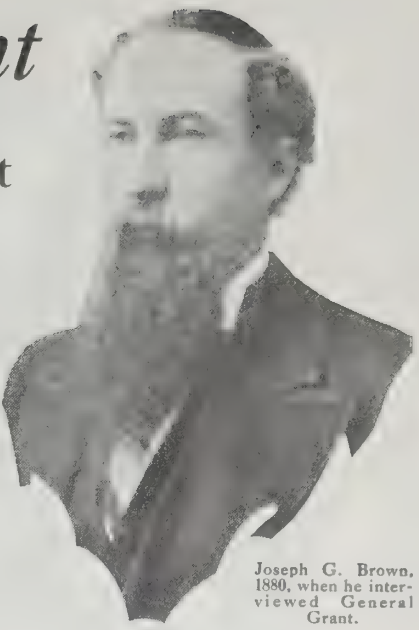
But the word in Washington today is that Helmaria Dawes is an eat-'em-alive fellow, notwithstanding his quiet demeanor during the time he was chief of the budget. He got the budget going in one year, got authority from President Harding to corral all bureau chiefs and chieflets to talk economy to them, demonstrating some of his views objectively, as in the case of the brooms (he brandished one as an example of governmental extravagance and purchasing inefficiency).

Hence Washington is in a state of expectancy. That is, it is, so far as concerns those who take for granted his arrival in Washington in the new rôle next March. Of course, there is another side to General Dawes as Vice-President, and that is both political and international. But that is another story that will have to be told later.

An Interview With General Grant

Veteran Newspaper Man Recalls Event of Historic Interest

Joseph Granville Brown, born near Nashville, Tennessee, raised in Tuscumbia, Alabama, printer, reporter, editor; 1871-1879 engaged on editorial staff of Louisville *Courier-Journal*, under immediate direction of Henry Watterson; 1880-1884 held similar position on Denver *Tribune* (Ottomar H. Rothacker, editor; Thomas F. Dawson, associate editor; Eugene Field, humorist and managing editor). For the past seven years attendant in the newspaper rooms of the Denver Public Library, after holding various public appointments.



Joseph G. Brown, 1880, when he interviewed General Grant.

By FRANCES HIGGINS

THE time is July, 1880. The Republicans had held their national convention in Chicago a month previously, nominated General Garfield, rejected their silent, unblushing, third-term candidate in spite of Conkling's oratorical eclat, in spite of the solidarity of the 312 delegates who stood faithful to the last ballot.

Bitterness and disappointment reign in the ranks of the party to an unprecedented degree; while, to add to the tenseness of the situation, General Grant has accepted his defeat with characteristic taciturnity. Not a word of comment, not a single enlightening interview!

To what extent does he share the feeling of bitterness and disappointment? Will he support General Garfield in the approaching campaign? Will he, perhaps, leave the party whose successful candidate he has been through two former elections?

These are the questions foremost in the minds of the people and the politicians. These are the questions that a whole army of reporters and correspondents had sought to have answered, as they literally besieged the General at hotels and aboard trains.

Thus far he has successfully evaded all, notwithstanding a few faked interviews to prove the contrary. He is taking a much-needed vacation, a rest from political cares and disappointments. He is making a tour of the West and the Southwest. Kansas City reports a hearty reception (and patriotic celebration July 4) for the ex-President, the hero of war and travel, but not a word as to the intensely interesting political situation; likewise Santa Fe, where he makes an even more extended stay.

Now the defeated candidate, whom the world has come to believe a sulking Achilles as well as a wandering Ulysses, is bound for Colorado. In the office of the Denver *Tribune,* owner and staff are conferring. As the leading daily of the city and of the West, the journal has a reputation to maintain. Shall it now attempt the impossible; seek an interview which the Eastern papers have failed to secure? That is the question.

"Why not send Joe Brown?" some one suggests.

Joseph G. Brown, reporter, but lately arrived from Louisville, is summoned before the conference. Well may the *Tribune* look with pride on its recent acquisition! He is no cub, but a graduate of Mr. Watterson's hard school, boasting seven years' experience on the *Courier-Journal*, as Mr. Rothacker knew when he stole him. He hears the dilemma of his superiors.

"I'll go and I'll interview him," he announces to the infinite relief of all concerned.

Just like that, he is off to the southern part of the state to intercept the General and his party, comprised of Mrs. Grant, Mrs. Frederick Grant and daughter, Julia, Colonel W. W. Smith, General Pope, Major Dunn and others. Colorado's reception committee—Governor Pitkin, ex-governors Routt and Hunt—has boarded the General's train at Pueblo.

Joe Brown meets the special on a siding twenty miles north of the town. He makes the necessary arrangements with the conductors and climbs aboard. Governor Pitkin politely hears his request and introduces him to General Grant.

The General sits in a reclining chair beside the open car window, puffing away at a huge Havana, looking out upon the sand and cactus waste, and the desolation wrought by a recent mountain cloudburst. He acknowledges the introduction, but instantly turns away. Very modestly the reporter stands before him to all appearances as calm, as unperturbed as he.

A mental note of the details of the General's costume is made for the *Tribune* readers Sunday morning. His plain cloth suit and broad-brimmed black hat, slightly turned down front and rear, remind one of Dom Pedro of Brazil, or of a plain old farmer in his Sunday best. The sprig of honeysuckle and the red rose of his *boutonnicre* bring a smile into the interviewer's eyes, a smile which he checks instantly.

The newspaper man, too, is being observed. No, it is not the silent General who is watching him, but pretty Miss Julia who occupies the chair beside his. Joe Brown faces the twinkle in her eyes, but turns again to his intended victim who seems to be concentrating on the cactus. At last, with an almost imperceptible nod of his head, Joe signals her to join the ladies of the party at the opposite end of the car. The request is complied with.

Joe stands until the General invites him to take the vacant chair with a wave of his hand. As the interviewer sits down he notes the manner in which the General holds the stump of his huge cigar between the thumb and forefinger of his right hand.

"What is it you want?" the General asks, breaking the silence.

"Your impressions of Colorado, your views on the current political situation, and anything of general interest that may develop," Joe answers briefly and brazenly.

"Your paper?"

"The Denver *Tribune.*"

"Republican?"

"Yes."

"You are welcome to print anything I may tell you," General Grant announces with a twinkle in his eyes, taking a puff at the cigar, and looking out of the window once more.

"Anything I may tell you," Joe repeats to himself. Is it sarcasm? Does he intend to say nothing at all? for he had been congratulating himself that the General was more cordial than his reputation. But what now? The great man still looks out of the window. It is plainly left to the reporter to lead the way. Intrepidly he makes another start.

"What are your impressions of Colorado as far as you have gone? When will you visit Denver? Do you weary of travel? How does such a scene impress you?" —indicating the sand and cactus waste outside.

The General answers slowly, but cordially enough, between puffs. Thus encouraged, Joe Brown approaches the all-important question which has proved the Waterloo of many a more famous correspondent since the eventful day of June 8. His voice is calm and steady, but so small is his grain of faith that he does not even bother to take out his notebook and pencil.

"I can say without hesitation," comes the answer, "that I will give General Garfield my most earnest and hearty support. I am a Republican. There is no reason why any Republican should hesitate to define his position, or not vote for Garfield. I know him to be a man of talent, thoroughly accomplished, and an upright man. I have nothing against General Hancock. But Garfield is the man for the office."

Joseph G. Brown, 1924, attendant newspaper rooms Denver Public Library.

Yes, it is General Grant, the silent, evasive, defeated candidate, who is speaking. He continues:

"A certain correspondent has reported a faked conversation in which he indicates that Conkling and Logan deceived me. I never saw the correspondent (or any other until now) and I can frankly say of all men they are the last I could find fault with, and I feel today more proud of the support of the 312 who stood by me in the convention than if the victory had been mine."

Joe Brown is delighted. He plans his return to Denver in triumph to publish his "scoop" on the front page of the Sunday *Tribune,* where it has rested in state on the file these forty years and more, near neighbor to articles on Dr. Tanner's long fast and De Lesseps' canal scheme. These are the headlines:

OUR GUEST

General Grant Arrives at Western Saratoga. He Is Received by Governors and Welcomed by Populace. Interview With the General by a Tribune Reporter

Meanwhile, his principal work done, Joe Brown steers the conversation into a more personal channel. *Tribune* owner, staff and readers may not care so much about this phase of the interview, however. It was a question which had haunted Joe for years, ever since the stirring day at Fort Donelson when, a member of the Twenty-seventh Alabama, he had raised his double-barrel shotgun and taken aim at the man who now sat beside him, and his boys in blue, making their first attack on the half-finished rebel entrenchments.

"General," he inquires of his former enemy, "have you ever met and talked with any of the private rebel soldiers—the men behind the guns—who actually fought against you in any of the battles in which you were the commander on the field?"

This has reference to the siege of Fort Donelson, the General's first great battle, and the later engagement at Champion Hill, Mississippi, or Baker's Creek, as Joe and his comrades in gray well knew.

"Well, no, I think not," the General replies slowly, thoughtfully. "I'm positive I have had no such talk with men of the rebel rank and file, but I have had more or less communication with representative men of the South and of officer rank in the Southern army."

"The question was asked, General, merely as one of personal curiosity, that I might form some idea of how you felt toward the individual soldier, as well as toward the enemy army as a whole."

Joe was thinking of the General's advice to the Southern soldiers at the time of their final surrender; of his generous return of the horses for the tending of the crops of '65.

The General senses it somehow, quickly removes his cigar and turns benignly toward his interviewer with a twinkle in his eyes denoting that he has been touched on a subject very near his heart.

"I am glad to answer that question," he says, "and what I have to say you are welcome to print. It is what I have thought and felt all the time. I may have spoken the same to others, but I have never before made it a matter for publication.

"My feeling toward the people of the South was that of affection and sympathy. Before, during, and after the war that feeling has never altered, but rather intensified. Through all my campaigns and in every battle I realized more and more that I was contending against a misinformed and misguided people—every individual soldier of them fighting unwittingly against his own interests, against his own person and his own home, as well as against the government that designed his protection and his promotion in the affairs of life.

"Hence in every battle I felt that I was performing but a paternal duty as a soldier and a patriot. In every battle there was constantly with me the consciousness that I was not fighting the Southern soldiers or the Southern people. I was all the more inspired and urged by the conviction that I was indeed fighting *for* them.

"Now, Mr. Brown, you can see by the many kinds of results of the failure of the Southern Confederacy by the success of the Northern arms, that my convictions were correct and my expectations concerning the fortunes and personal welfare of the Southern soldiers have been realized in this brief space of fifteen years since the last gun of the war was fired. Whatever the Southern soldier imagined or was taught to be the 'rights' for which he fought, the bare fact remained that he was fighting for no greater boon than the perpetuation of Negro slavery in the South.

"What would have been the fortunes and position of the Southern soldiers and the poor people of the South in general if they had won the war? Negro slavery would have dominated and crushed the spirit of human endeavor in the way of independent enterprise.

"Subject to an oligarchy of slave-owning rulers, the poor white man of the South, in competition with slave labor, would have continued to eke out a bare living from the soil and the provincial workshop, with none of the advantages of the great industrial enterprises that are now building up and in progress there.

"One of the best illustrations of the great benefits to Southern people of 'Victory out of their defeat' is that of the improvement and financial success of many who have availed themselves of opportunity in all parts of the land. Look, for example, at the number of young men of the South who have gone to New York and other large cities and made fortunes within the past ten years.

"Others have risen to positions of prominence in the professions and in official life in many parts of the country, while in their native states young men of the South are advancing in all kinds of industry and business pursuits. All such wholesome changes in the status of the Southern people were contemplated in my vision of the final result, while fighting first of all for the preservation of the Union; and now I can realize that all that was happily prophetic in that vision is coming to pass."

The General's eyes are twinkling as they rest on Joe Brown. The interviewer understands that he has been included with the rest of his comrades in the vision, he who had once lifted his gun and taken aim against him, but had long since left his Alabama home for a journalist's career in Louisville and the Far West.

With the General's closing words the train pulls into Colorado Springs. The commotion ends the historic interview.

Shameful Story: Rhode Island Senate Forced to Flee

Unparalleled Tale of Political Terrorism and Physical Violence at Providence, R. I.

By WILLIAM ROBINSON

WHILE the rest of the country has been absorbed with oil investigations, national conventions, the graduations of the young folk and other affairs that have taken their whole attention, the state of Rhode Island, tiniest of all the forty-eight states in the Union—and probably the wickedest—has had her entire attention focused on what was going on within her own borders.

A struggle that to many is just as serious as that which faced Russia during the World War, and to some as that which faced this country in the days just before the American Revolution, has been waged within the borders of this state for more than a year and a half.

Recently the nation and the world have been treated to the spectacle of the longest filibuster in the legislative history of this country, which ended when poison gas was planted in the chamber of the Rhode Island senate, after the senators of both parties had grappled for nearly fifty hours without a single recess. Several senators were overcome by the poisonous fumes. Gunmen, blacklegs and hurly-burlies intimidated and threatened duly elected representatives of the people, until they were forced, after recovering from the noxious fumes of bromine gas and the threats of thugs and gunmen, to flee the state and take refuge across the borders of their own state in the commonwealth of Massachusetts, where they "holed up" under the protection of strong arm men of their own, lest they be kidnapped and brought back by their political opponents, who, they allege, were responsible for the conditions that made them flee. Members of the senate have called for "Bloodshed" and the lieutenant governor himself has threatened: "By God, We'll Kill Them."

And this is politics, "as she is spoke" in Rhode Island.

In the political crisis that faces Rhode Island, every human emotion has a part. Hatred, loyalty, devotion to duty and principle, religion—everything except common sense.

For years Rhode Island suffered from boss rule. It was the most conservative—reactionary, if you like—state in the Union. Its statute books still carry the property qualification clause for voting. Its constitution has not been revised in nearly three generations. Rhode Island has successfully held out against a forty-eight-hour law. In Rhode Island the city of Providence, with a population of nearly 300,000, has but one senator in the general assembly, while the town of East Greenwich, with approximately 300 voters, also has a senator, who is endowed with all the powers of the senator from Providence.

And now Rhode Island is engaged in a fight for constitutional reform—or at least that is what the Democrats declare. But what a fight! Gunmen and thugs have been employed to take stations on the floor of the senate chamber. One session opened with a free-for-all fist fight, in which members of the senate, spectators (both male and female) and officers were mixed up in a fighting, cursing, screeching ball of humanity.

Finally, the day the Republican majority in the senate fled from the chamber and the day the poison gas was used, a surging mob of blood-mad citizens threatened to break down the doors behind which the majority members had taken refuge, and, backed by alleged authority vested in them by the lieutenant governor, to drag the gas-poisoned and weary majority members back to their seats in the chamber. Guarding the weary and prostrated Republicans were a dozen deputy sheriffs and nearly a score of Providence policemen. They stood between the majority of the senators and the mob—guns and clubs drawn, and ready for action. It required but a spark to start a conflagration that would have burned into the legislative annals of America one of the most disgraceful chapters ever written in the history of any country. But that spark, fortunately, was not furnished.

A Rotten Racial and Religious Division

WHAT is this all about? How is it possible for a minority to thwart the will of a majority and drive them from the legislative halls where, according to the fundamental principles of American government, they should hold a controlling hand?

On the surface, as stated above, it is supposedly a fight for constitutional reform, though in truth the causes are much deeper rooted. It bids fair to become a struggle in which the Protestant community, at least partially represented by the Ku Klux Klan, will be pitted against the Catholic vote of the state, represented by the Irish and French Canadians, who form a formidable voting block.

A year ago last autumn Rhode Island went Democratic, due very largely to the effects of a great textile strike, supplemented by the fact that the Republican vote did not come out, being complacent and almost indifferent after years of supreme power in the state government. The Democratic minority seized its opportunity, and after a whirlwind campaign carried practically every office on the state ticket. They elected the heads of their ticket, William S. Flynn, governor, and Felix A. Toupin, an unheard-of French-Canadian, lieutenant governor.

During their campaign they made numerous and sundry campaign pledges, without qualifying them with the eternal "if," which in their case was "if we have a majority in the general assembly." One of these promises was that a constitutional convention referendum bill would be passed to determine whether the archaic Rhode Island constitution, unrevised since 1843, should be revised in 1925 to meet the changed conditions of the twentieth century.

Are such things possible in the United States?

Here is a great state, once the home of tolerance and liberty, now ruled by a mob.

The names Democrat and Republican have no meaning in a contest like this, for it is not a political contest—it is religious, racial and class battle all in one.

This story is published in the hope that people everywhere in the United States will take note of the elements which are fermenting in American society.

The shame of Rhode Island is an object lesson to all the states.

In 1923 the Democrats, in the minority in both house and senate, made a valiant effort to jam some of their political measures through. They failed, after a filibuster in the senate which lasted approximately five months. But 1924 was still ahead of them before they again faced their constituents on the political stump (for Rhode Island holds elections biennially)—and they had learned a lot in 1923.

Among other things, they had learned that under the Rhode Island constitution, the party in the senate to which the lieutenant governor belongs holds the key to the whole destinies, at least in a legislative sense, of that body. Though he is not a member of the body over which he presides, the lieutenant governor of Rhode Island is the presiding officer of the state senate, and in case of a tie, he holds the deciding vote. Early in 1923 Lieutenant Governor Toupin, who had served a single term in the Rhode Island house, and who gleaned a living from dabbling in insurance and real estate (this being his entire political background) followed the joint rule book and entertained an appeal taken by a Republican senator from one of his decisions. On the vote that followed the appeal was sustained by the Republican majority. That taught Lieutenant Governor Toupin a lesson. From that day to this, rule book or no rule book, parliamentary precedent or no parliamentary precedent, he has never entertained an appeal from any Republican senator who dared to question one of his decisions. He had tasted power, and the taste was sweet.

He quickly learned, also, that though the Democrats were in the minority in numbers, in his position they held the only key to the legislative power of the senate. Many people have been puzzled as to how it is possible for a minority in a legislative body to throttle a majority. In the case of the Rhode Island senate, with Lieutenant Governor Felix Toupin in the presiding officer's chair, it is a very simple matter. It works in this fashion:

A Republican senator addresses the chair, is recognized, and proceeds to make a motion. Two or three other Republicans may be on their feet calling for recognition for the purpose of seconding it. The lieutenant governor proceeds calmly to ignore all Republican members, calls upon a Democrat, who makes a counter motion, which kills that made by the Republican senator.

That is absolutely all there is to it. The Republicans may protest, it does no good. They are informed by the lieutenant governor that the rules say he shall recognize the senator whom he sees first, and he never fails to see a Democrat. Several times Republican senators have been recognized, and they have begun their motion in this fashion:

"Mr. President, I am going to make a motion, and I respectfully call to the attention of the presiding officer that Senator Sanderson or Johnston is also on his feet, waiting to call for recognition in order to second the motion that I am about to make."

But it never works.

However, to return to the events that have led up to the conditions that exist in the Rhode Island senate today:

The senate convened on January 1, 1924. At the outset the Democrats served notice publicly that they would not allow a single act to come before the Rhode Island senate until the Republican majority agreed to *pass* (not merely to vote upon) the Quinn bill which provided for a constitutional convention referendum.

A State Absolutely Cut Off From Supplies

MEANWHILE the Republicans had agreed that the property qualification clause for voting, which provides that one must own one hundred and thirty-two dollars ($132.00) worth of property to vote in Rhode Island, should be abolished. They agreed also that the representation in the senate should be redistricted, as it was manifestly unfair that the city of Providence should have but one senator, while the small country towns numbering their population in hundreds should also have one representative in the senate.

But a constitutional convention was a horse of another color. "The constitution itself provides how that document shall be amended," said the Republicans. "We do not favor a constitutional convention. We don't believe our constituents do, either. Bring out your bill. Let us all vote upon it. If a majority vote against it, you have done your part. We will take the responsibility for our votes, and then you folks go before the people during the next campaign and tell them that we killed it. Meanwhile bring out some of the state's business and let's get on with it. We'll settle our differences during the next campaign, but don't let us make a political stump out of the senate chamber."

"Nothing doing," said the minority. "We hold the whip hand in the political loyalty of our presiding officer. You can't get a thing before this senate except with his permission, and he is instructed not to allow the Republicans to bring out a single bill until our constitutional convention bill has been passed by you fellows, whether you agree with it or not. We filibustered for five months last year. With Felix Toupin's help we'll filibuster for twelve months this year, if necessary.

And now it looks as though they really mean to do it. As yet not a single important act or resolve has passed the senate. Buried deep in the calendar is the annual appropriation bill, which provides the finances for running the machinery of the state. It carries some 400 items totaling approximately $5,000,000.

The money is in the state treasury, but *since March 1 the state employes have been going without their pay.* The state institutions have had no money from the state on which to keep going and pay their bills. There have been institutions that would have closed had it not been for public-spirited citizens who advanced them money until such time as the appropriation bill is passed. The wards of the state—the orphans, feeble-minded, insane, the poor, the disabled soldiers—have faced circumstances which meant life or death to them. The situation created a tremendous amount of public feeling, and it has cost the state a lot of valuable employes, who cannot be replaced for a long time. Yet men with families could not work for nothing.

The Democrats were finally forced to recognize this crisis, though much against their will. They stated that they were willing to pass temporary appropriation bills covering one month each and based on the expenditures provided for in the regular appropriation bill of last year. But here again a snag was encountered, for the Republicans refused to consider the temporary appropriation bills, pointing out that the regular appropriation bill covering the whole year was on the calendar and available, and they offered to call this out and pass it, and then go on with the filibuster.

For two months the fight has waged for the most part around the emergency appropriation bills, though when the "show down"—or what was thought would be the "show down"—came, the struggle again centered around the constitutional convention bill.

Meanwhile, for weeks on end, the Democrats have filibustered day after day. They have read books hour after hour: treatises on dentistry, inductive logic, constitutional

Gas, Assaults and Thugs Menace Personal Safety

Scandalous Scenes Which Raise the Question "Is Our Government Disintegrating?"

government, the classics—anything that would take up time. They have indulged in shocking personalities, calling their fellow members everything from "cock-eyed liar" to "ignominious curs," "scoundrels" and "hypocrites," and never once has the presiding officer interfered, as long as it was a Democrat who was indulging in an orgy of personal abuse.

Toward the middle of March Lieutenant Governor Toupin arbitrarily barred the reporters from two Providence newspapers from the senate chamber, because their reports of the previous day's session did not suit him. He announced that *unless they were willing to submit their reports to him for censorship they would henceforth be forbidden their seats at the press table.* Despite the fact that the secretary of state's record and the account in another newspaper coincided exactly with the report that the lieutenant governor had taken exception to, the reporters from the Providence *Journal* and the *Evening Bulletin* were barred thereafter, because they could not submit to such arbitrary rulings and keep their self-respect.

He Stood Up Defiantly for Ten Hours

AND so the fight wore on, month after month, becoming more and more bitter. On May 9 a crisis was reached. It happens that a president pro tempore of the senate is elected each year. At the present time he is Senator Arthur A. Sherman, of Portsmouth, Republican floor leader. He is supposed to preside over the senate in the absence or illness or in case of the resignation of the lieutenant governor. On May 9 with all but two or three of the senators in their seats, the lieutenant governor arbitrarily declared the senate in recess, a thing he has no right to do, under the joint rules. The Republican senators questioned the recess. They said they were present and ready to do business, and they called upon the lieutenant governor to proceed with the session. This the lieutenant governor refused to do.

At this juncture Senator Sherman arose and called the attention of the lieutenant governor to the fact that he (Sherman) was temporary president of the senate, and he stated that unless the presiding officer proceeded to call the senate to order, he, as temporary chairman, would do so. The lieutenant governor ordered Senator Sherman to take his seat. Once before, in 1923, he had issued the same order to the same man, with the qualification that the senate would remain in recess until the senator did take his seat. For nine hours and forty minutes Sherman stood silent on the floor of the senate, and for nine hours and forty minutes the lieutenant governor sat stubbornly in his chair. So this time he did not qualify his order.

After repeated attempts to force the lieutenant governor to call the senate to order, the Republican leader finally walked to the desk of the senate clerk, called the senate to order himself, while the lieutenant governor pounded wildly with his gavel, and, under the very eyes of the lieutenant governor, the senate proceeded to adjourn and a majority of the senators walked from the chamber, leaving less than a quorum present. Secretary of State Ernest L. Sprague, also Republican, and reading clerk, Judge James E. Dooley, another Republican, went with them.

Left flat, the Democratic minority went into caucus for a time. Then, there being no majority member present to question the presence of a quorum, they proceeded to get down to business. The Quinn constitutional convention bill was locked up in the secretary of state's safe, so they drew a new bill, identical with the original, and proceeded to pass that. They also proceeded to pass an emergency appropriation bill, confirm forty-eight appointments of the Democratic governor, and then pass the Lavendar forty-eight-hour bill, the only bill they could get at. They reached this by breaking open a desk in a committee room. This bill was straightway taken to the governor, who, when he heard of the rump session of the senate, went at once to his office in the state house, and before midnight he had signed the bill. After they had done all they could, the minority proceeded to adjourn, without the question of a quorum having been raised. However, the secretary of state's records showed that they had adjourned in the afternoon. Then came a fight over approval of the records. That fight hasn't been settled yet. After the rump session which accomplished nothing really, things limped along for more than a month, both sides striving to make political hay out of the stubbornness of their opponents.

Things were coming to a head, however, much more quickly than was apparent.

Finally came "Friday the Thirteenth" of June. On that day a filibuster started which lasted for twenty-three hours, at the end of which time, according to a majority of the spectators and observers, the lieutenant governor seized upon an opportunity to "quit." Although there were some thirty-odd members present in the chamber, the lieutenant governor suddenly announced that until Senator Jesse H. Hopkins, of Coventry, who had just left the chamber, returned to it, the senate would be in recess. Republican Floor Leader Sherman stated that inasmuch as twenty members constituted a quorum, and there were more than thirty present, he failed to see why the presence of Senator Hopkins was necessary. The lieutenant governor replied in terms which amounted to the popular expression: "You heard what I said."

Thereupon the Republican leader took the reins as he had on May 9, and the senate adjourned under the eyes of the lieutenant governor for a second time. This time, however, the Democrats did not hold a rump session. Instead they announced that, when the senate convened the following Tuesday, June 17, they would continue the filibuster.

That is exactly what they did, though not quite as they expected. When two o'clock came on Tuesday, the hour at which the senate is supposed to convene, the Republicans were all on hand and filed into the chamber. It had been the custom of the lieutenant governor to delay calling the senate to order anywhere from one to two hours. The Republicans, however, had decided that this was not to be, at least for once, and after waiting for five minutes for the lieutenant governor, Senator Sherman mounted the rostrum, picked up the presiding officer's gavel, and called the senate to order. A huge crowd was on hand, and they were breathless with excitement. As the clerk began to call the roll, Senator Robert E. Quinn, one of the Democratic leaders, leaped to his feet and shouted that he would not permit the clerk to call the roll. The clerk continued to do so, however, whereupon Senator Quinn leaped bodily upon the reading clerk and bore him to the floor. Immediately the senate was in a turmoil. The vast crowd surged over the senate chamber, striking, cursing, yelling, fighting and scratching. In vain did the temporary chairman call for order. The senate was a madhouse. The battle had been going several minutes, when lieutenant governor Toupin scuttled into the chamber, and the Republican leader surrendered the gavel to him with a formal bow. Cheers for Toupin reverberated throughout the chamber, and it was nearly half an hour before the last of the battlers were separated, and a semblance of order was restored.

Senators Stricken With Poison Gas

THEN the filibuster started. The Democratic members when weary were allowed to go to their rooms in downtown hotels or to their homes. All that was needed was for the Democrats to have the presiding officer in the chair and one member of the party holding forth upon the senate floor. Hour after hour the Republicans sat mute before the torrents of personal abuse that were launched upon them by the Democratic senators. From Tuesday at one o'clock in the afternoon until Friday morning the Republicans sat in the senate chamber without a recess.

Then came the poison gas. It was bromine, according to the analyses of chemists. Some one wrapped a test tube filled with bromine in a newspaper, the tube being sealed with paraffin wax and wrapped in cotton batting. This package was dropped on the floor and then stepped upon, so that the fumes were loosed upon the chamber. For more than an hour the senators and spectators were conscious of an irritating odor, but no one thought of such a thing as poison gas.

At last it became so unbearable that, without calling for a recess or making any other sort of provision for halting the senate proceedings, Lieutenant Governor Toupin got up and left the chamber. *Just prior to this his barber had shaved him as he still sat in the presiding officer's chair.*

Immediately there was a rush for the lounge and the lavatories. Senators Sherman and Sanderson, Republican leaders, were violently ill and lapsed into unconsciousness. Senator Powers, Democrat, was also ill. Senators Cole and Sharpe, both Republicans, collapsed in committee rooms. The lieutenant governor was ill, but he sat before an open window, swathed in cold towels, and then he threw himself on a couch and fell into a deep sleep, the first he had had in more than sixty hours.

But Democratic senators, as soon as the chamber was cleared of the fumes, and their source had been discovered and removed, saw the strength of their position, and they awakened the weary Toupin and demanded that he call the sick and fatigued Republicans back to the chamber to continue with the session, which had developed into a contest in physical endurance between the Democratic lieutenant governor and members of the Republican majority. The lieutenant governor at once responded to the call of his party, returned to the rostrum and called the senate to order.

Meanwhile the Democratic governor, William S. Flynn, had been notified of what had taken place in the senate chamber. He rushed from the executive offices, made a cursory examination of the situation and declared to newspaper men that this was a foul plot to suffocate, if not to assassinate the lieutenant governor, and he declared he was going to get to the bottom of the plot. He turned the case over to the attorney-general's department, where an investigation is now being carried on. The fact that four Republican senators had been so severely stricken that they were carried to the hospital, while but one Democrat had been affected, did not detract from the accusations that it was a Republican plot.

When the lieutenant governor called the senate to order the Republicans were absent. They were in the committee rooms, recuperating from the effects of the gas. They quickly sensed the situation, and sent back word that they were in no physical condition to return. The lieutenant governor called the sheriffs and ordered them to return the Republican members to their seats. The sheriffs reported that they had delivered the lieutenant governor's order, but the Republican members were in no condition to return. The lieutenant governor flew into a rage, ordered the sheriffs to obey his orders, and immediately swore in ten men, some of them well known "roughnecks," alleged to have police records, and commanded them to "break down the doors" and bring the Republicans back to the chamber.

Gunmen Called Into Service

AT ONCE the crowd surged into the halls. The ten "deputies" lined themselves outside the doors of the committee rooms. In the doorways stood the deputy sheriffs, silent and watchful. Inside were the Republicans, and in front of them sixteen policemen with clubs drawn and revolvers handy. One overt move on the part of the Democratic henchmen would have resulted in bloodshed. Fortunately that move was not made. A doctor sent a certificate to the lieutenant governor, stating that the Republican members were in no physical condition to return to the chamber. Then the minority members recessed "for fifteen minutes," and immediately went into conference, while the horde of spectators milled about in the corridors and uttered all kinds of dire threats, stimulated, of course, by the excitement of the morning.

Then the Republican senators, on a warrant issued by the lieutenant governor, were placed under arrest by the high sheriff. Under guard they left the building, and the next that was heard of them was that they were outside the state.

And all this came just when the Democrats had sent emissaries to the Republicans seeking a compromise. The governor had been in his office through the night. He and leading Democrats had been in conference, and the editor of a Democratic newspaper acted as emissary in the matter of the compromise proposal. The writer of this article heard the proposition made, and grounds upon which the two parties could meet had been established. Then came the poison gas, and all thought of compromise was ended. The Democrats blamed the Republicans and the Republicans blamed the Democrats. It is probable, however, that the planting of the gas was the act of a fanatic, and neither party as a whole was responsible.

As Friday, the twentieth of June, wore along a conference was arranged. It resulted in nothing, however, except a declaration from Senator Quinn, one of the most belligerent of the Democrats, that "if there must be bloodshed, let there be bloodshed," and a statement by the lieutenant governor, made before a large group of people, that "By God, the next time we get them there we'll kill them!"

The night of Sunday, June 22, found the Republican members of the senate still outside the state, some of them in Massachusetts and others in Connecticut. The Republicans uncovered what they declared was a plot to kidnap sufficient of the majority members to make a quorum, with the result that the Republican forces got busy and by daylight had all of the Republicans corraled in the Hotel Bartlett at Rutland, Massachusetts, under armed guards, where, at this writing, they still are and where they propose to stay until the governor and lieutenant governor will guarantee their personal safety as they attend the sessions of the senate.

This, then, is the situation that faces Rhode Island today. The outlook is that before the battle is over—this political battle that is almost without precedent in the political annals of any state in the Union—troops will be called out and the state government will function only under the muzzles of loaded rifles of the National Guard.

Mr. Sapiro Speaks for Himself on Witness Stand

His Testimony Before Royal Grain Inquiry Commission—PART II

(*Concluded from last week*)

By Mr. Pitblado:

Q. Now, speaking of these contracts, these five-year contracts, as I understand you, they are really an essential in order that the pool may properly operate?

A. Yes. I would not ever advise—

Q. Now, you can answer a lot of my questions by just yes or no. A. I would never advise the formation of a co-operative market association without a contract.

Q. Now, that is yes, then. Just answer me yes, because I am not going to mislead you. Now, the contract is an essential feature and is intended to be what it says?

A. Absolutely.

Q. You have seen the contract that the Alberta pools—I will call it that name. That is not its legal title—that the Alberta pool has with the farmers?

A. Yes.

Q. It is your contract? A. No.

Q. Well, you approve of it. It is in the long term form. A. It has the long term arrangement in it.

Q. And it had the penalty that you were speaking of to Mr. Woods? A. We don't call it penalty. It is liquidated damages, I don't like you to call it penalty.

Q. You have the remedies, let me put it that way, that are in this contract. A. Correct.

Q. Among other things, *the pool can go on the farmer's place and take his crop?* A. No, we don't put that in our contracts.

Q. Is that a good feature? A. I don't think so.

Q. Well, *it is here,* anyway. You don't think that is a good feature? A. No. We have never used it.

Q. I want to get what is good and what is not good in the Alberta pool. A. I don't say it is not good. We have never used it. It was the contribution of the Alberta pool. It is probably wise there, but I would not use it in the United States and I would not have suggested it here.

Q. I understand you are an expert on the co-operative plan? You have been working at it for years.

A. I am supposed to be. Yes.

Q. Now, that is in this contract and I want to get your views? A. Mr. Chairman, may I—

Q. Will you please answer my question.

A. Don't raise your voice to me. I will not allow even another attorney to bully me. If you raise your voice, I will not answer.

The Chairman: Let us start again more quietly.

By Mr. Pitblado:

Q. Now, let us get back to where we were. You said you did not use that in the United States. A. No.

Q. I may take it that was put in by counsel for the pool without your approval. A. I would not say that. I would say I would not have put it in, but the counsel put it there and I believe he knows more about the conditions in Alberta than I do and I accept his judgment.

Q. What different conditions would there be in Alberta than in the United States? A. He may know that. I don't.

Q. You don't know of any? A. I don't, but he might.

Q. You know of no difference in Alberta than in the other states of the Union. A. No. I might say I know another case in the United States where that is done, where that is in the contract, and I don't say those attorneys were wrong. With the Raisin Association they made their contracts—

Q. Now, just a minute—A. I demand the right to answer in my own way. I don't say the stand they took is wrong, but I don't do it in my contract.

Q. Now, Mr. Sapiro, you are a lawyer, I didn't ask you anything about a raisin contract, I was asking you about the Alberta pool. A. And I am answering so that you will get a full book of my mind, and not merely the thing you want me to say.

Q. Have you ever acted as counsel at court?

A. Slightly.

Q. Then, you will know this, that I am going to try to get answers to my questions from you. A. You will get them if you will be a little more polite.

Q. I am going to try to get answers and I don't want speeches. Now, come back to this: do you approve or not of that clause that is in the Alberta pool contract? A. I approve of it, on the judgment of the Alberta counsel.

Q. So, you do approve of it: Sapiro approves?

A. No. I never refer to myself in the third person. I approve of the judgment of the Alberta counsel.

Q. You know the other clause. That is the one about liquidated damages, in this contract. You told Mr. Woods about the clause about liquidated damages. You know of that clause which is in here? A. I think it is in there.

Q. And you approve of that one? A. Yes.

Q. Your system is a new one. When I say new, I mean new in Canada. It is a new marketing system and not the old Exchange system. A. I would not say that. It is new, as far as control of the farmer is concerned, but it used anything available for sale purposes, including the Winnipeg Grain Exchange.

Q. Is it part of your plan to use the Winnipeg Grain Exchange? A. If ever they get to the point where they had 100 per cent of the farmers, or thereabouts, signed up in the three provinces, the Winnipeg Grain Exchange would disappear. Up to that time there is no question but that the Winnipeg Grain Exchange will be there. As long as it is there and as long as any of its members, or the Exchange as such, can perform any sort of function which seems helpful or profitable to the pool, the pool should use it for that purpose.

Q. I am quoting again from your speech, "A wheat pool does not need an exchange." A. It does not.

Q. And you did say that in Winnipeg here?

A. Correct. But you work with the weapons of the devil, if they are the only weapons you can find.

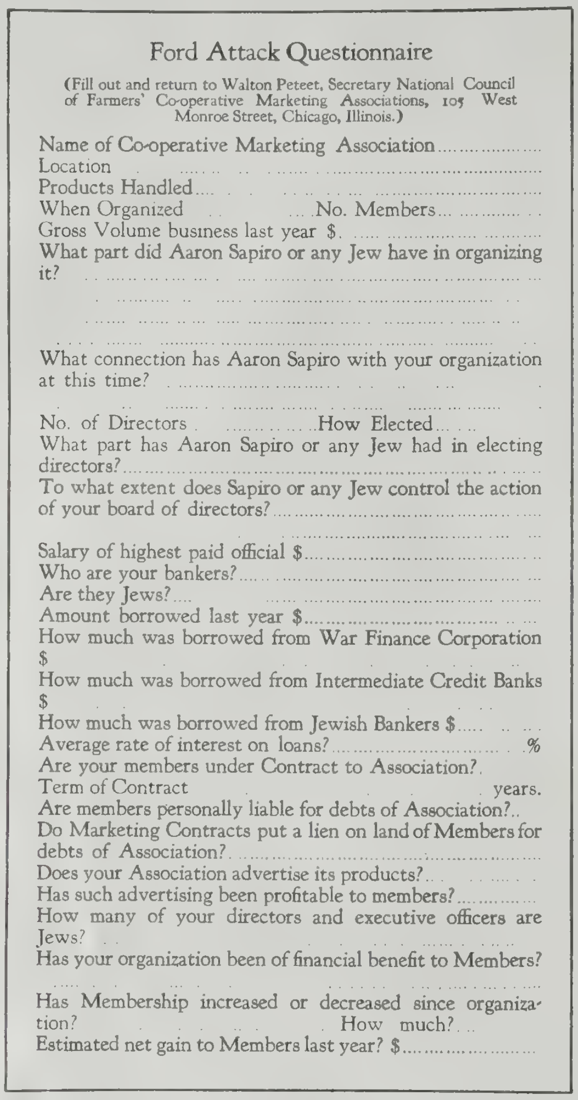
Q. Now your methods of financing. I am just going to ask one question about it. Advances are made to the farmers? A. Advance payments.

Q. The pool managers decide how much the advance payment is to be? A. No. They usually do that by conference with the banks and the bankers are the ones who decide, usually.

Q. So then, it is the banks that decide?

A. Yes.

Q. And the pool then is limited in the advance it can make to the farmers by the view of the bankers with whom the pool is doing the business? A. Naturally. The banker is an expert on collateral and we follow his advice as much as we can.



Ford Attack Questionnaire

(Fill out and return to Walton Peteet, Secretary National Council of Farmers' Co-operative Marketing Associations, 105 West Monroe Street, Chicago, Illinois.)

Name of Co-operative Marketing Association..................
Location ....
Products Handled..................
When Organized ....No. Members..................
Gross Volume business last year $..................
What part did Aaron Sapiro or any Jew have in organizing it? ....
What connection has Aaron Sapiro with your organization at this time? ....
No. of Directors ....How Elected..................
What part has Aaron Sapiro or any Jew had in electing directors?..................
To what extent does Sapiro or any Jew control the action of your board of directors?..................
Salary of highest paid official $..................
Who are your bankers?..................
Are they Jews?..................
Amount borrowed last year $..................
How much was borrowed from War Finance Corporation $..................
How much was borrowed from Intermediate Credit Banks $..................
How much was borrowed from Jewish Bankers $..................
Average rate of interest on loans?..................%
Are your members under Contract to Association?..................
Term of Contract .... years.
Are members personally liable for debts of Association?..................
Do Marketing Contracts put a lien on land of Members for debts of Association?..................
Does your Association advertise its products?..................
Has such advertising been profitable to members?..................
How many of your directors and executive officers are Jews? ....
Has your organization been of financial benefit to Members? ....
Has Membership increased or decreased since organization? .... How much?..................
Estimated net gain to Members last year? $..................

Walton Peteet, secretary of a Sapiro organization, sends out this sheet of questions. It is the Jewish angle that troubles him most, apparently. The Farmer's Union that sent in the above copy answered, "he can't get his strangle hold on us," to the question, "To what extent does Sapiro or any Jew control the action of your board of directors.

Q. You can give yes or no to me in these questions.

A. I don't want to get misquoted and I am going to take care about it.

Q. And the allowances are being made on security of the wheat? A. Sometimes. They vary that. Sometimes the banker advances on open account on the statement of the association, but in my judgment, that is poor banking practice and we don't advocate it, generally.

Q. I am not speaking of what is good banking practice. The plan is for the banks to advance on the security of the wheat? A. Yes.

Q. And Mr. Woods brought out with you the point that in working out this financing the bank might at a certain time come to you and say, "We must have the margin increased that we have here"? A. Yes.

Q. And in that event that might mean selling some wheat? A. Yes.

Q. Even although the pool managers thought it wise to hold it? A. Yes. They would be, to that extent—I don't want to use an improper word, I don't want to say at the mercy of the bank, but they would be at the advice or instruction of the bank. A. I would even accept your phrase, "At the mercy of the bank." The farmer is taking his chances of being at the mercy of the bank or at the mercy of the speculator. I don't object to your language. I am perfectly willing to accept it.

Q. I am only asking you about your plan. I am not going to abuse what you say here. A. I am going to see that—

Q. You are unduly suspicious. A. Well, you have kept my record so very nicely of those speeches, you put me on my guard. I feel that I have to watch out, and I naturally feel flattered—

Q. We don't worry very much whether you feel flattered or not, but we do want to get the facts from you. I want to get your plan of financing. Now, your plan works out along that line and you did say this to Mr. Woods, I want to see that I get you correctly, that you have at times to go to the banks and make your financial arrangements. A. We always do.

Q. And you said this, that sometimes the banker might hold control, and you have to borrow on the best terms you can? A. Yes, we do.

Q. You mentioned to Mr. Woods the fact that as the pool sells they get back, of course, on the price more than they have advanced to the farmer. According to the plan, *when is the time that the pools distribute to the farmers for last year's crop?*

A. *There is no fixed time.* You get your money there, but you have no specified time. You might sell all that you have, all some one particular grade of grain, then you distribute that because there is no longer any indebtedness against that.

Q. Then I was going to ask you this: What is the plan, when say for the crop grown in 1923, that the Alberta pool is handling now, *when may the farmer who has his wheat in the pool expect to get his complete and last payment for his wheat?*

A. I am a lawyer, not a prophet; I don't attempt to answer that.

Q. You object to answer it? A. I can't tell; I don't know their final sales.

Q. *Take with your practice with other pools,* isn't it expected that this year's crop will be closed out, completely paid for, probably within a year?

A. No; what we always hope to do is to have the majority of the crop sold within the year, but not necessarily. *We frequently have what we call "carry-overs"* in the Co-operatives.

Q. I want to get at, if you can tell from the practice in the States, when the Alberta farmers who went into the pool for this 1923 crop expect to get the major portion of their payments completed?

A. I don't know their sales and I can't answer that, except I have a conviction that what they will get will be in good time and in good amount, and that the Alberta pool has been handled wisely and well.

Q. You are giving us some convictions; I am asking, on the pool plan, is it contemplated that within a year the bulk of the payments will come back to them?

A. *The bulk of the payments shall come within a year, not necessarily the bulk of the payments should go to the growers, but the bulk of the payments should be received by the pool. Then the question of the distribution by the pool to the growers will depend on whether or not the bankers plus the pool think the distribution is safe as against the carry-over.*

Q. But some farmers are anxious to know, with nothing in the contract, when they may expect to get their payments from the pool on their wheat?

A. It is common propaganda to suggest to the farmers that the association will hold the wheat for five years.

Q. You need not answer that, because I have never heard about that.

A. I am surprised that with all you have heard, you have not heard of that. What we say is this: every director sitting on the pool board has his wheat in the same pool as every member, and being human he usually wants to get his money as quickly as he can, and he can't get that money quickly without getting it quickly likewise for every other member of the pool. So that the pool practice and the experience universally is that they get the bulk of the sales in that year, and get the payments as soon as it is wise to give them both to themselves and to their fellow members.

By Mr. Commissioner Scott:

Q. Your suggestion is to move the crop gradually, Mr. Sapiro, I understand? A. Not necessarily. You may have to do a lot of selling at the autumn period; for instance, if you feel that there is a position in Europe which would justify faster sales you would do it. Supposing speculative groups decided that the market was going up, and they would not sell. Well, the pool might want to sell at that time. In short, there is no attempt to prescribe either the speed or the volume or the regularity of sales. What we say is that there would be a group of men who could study the market as the dealers are doing now, and who could act for the farmers with commercial wisdom with the large volume of wheat they will have in their hands.

By Mr. Pitblado:

Q. Now I am coming on to this world pool idea. You have in some of your speeches pointed out to your hearers your view of what I might call this international pool. I do not want to call it a "world pool" by indicating that all the countries are in. You pointed out, for instance, I think, this at Edmonton:—August 23: Speaking of the Old Country dealers: "They make their price, looking at wheat as a world commodity." That is the correct view, is it not, today?

Dr. Magill: I want to get the right idea and see the commission gets the right idea of the pool idea. Then you went on to say in your speech at Saskatoon that you "hoped Australia would join the pool with her surplus wheat as well as New Zealand." That is correct, is it not? A. Yes.

Q. That "Argentina is in it"? A. No, I did not say that.

Q. Well, that is the way it is printed. "Argentina is in it. There were two representatives of Argentina at my office to get all the contracts and opinions as to whether or not they should have a compulsory pool or a voluntary contract pool." A. That is correct.

Q. You mean they were working on it?

A. No, that there are people from Argentina who were interested in it. They do not know yet whether they are going to realize a form of pool by government fiat, or have a voluntary pool.

Q. "That is the expectation of the American leaders as well as the best Canadian leaders, that we will form pools in each of the great wheat producing coun-

Mr. Ford's Page

THE new conservatism, as we shall call it, is upon us as a temper of national thought. The people are thoroughly convinced that the professional extremists have no program of progress, and no ability to develop it if they had one. Extreme conservatives and extreme radicals alike are keenly sensing a great decrease of interest on the part of the public. The people have listened to everybody, given everyone his chance, ventured out here and there upon more or less tentative radical departures, but now have made up their mind what they want to do, and what they are going to have.

In this country, for a long time to come, they are going to give the management of their affairs to men who have the soberness of conservatism, the responsiveness of progressivism and the human sensitiveness of the socialism of forty years ago. The new conservatism is the old brains, the old business experience, the old wisdom, focused on the public service and the general good. All that was formerly devoted to the service of finance, imperialism, industry, control of government, is to be devoted to the service of the people as the best way of establishing decent finance, useful industry and stable government.

THERE is nothing ever wrong with ability, ambition, achievement; but they can easily be wronged by being used to bad ends. In this country we are through condemning these qualities; we are seeking to harness them to useful ends. To be good is not enough; a man must be good for something; unfortunately we have often mistaken weakness for goodness, because it is harmless and brainless. Even goodness is not good unless it is good for something. We are proving that ability and ambition have better outlets in service. The most radical and the most conservative thing we know is Service—not a thin idealistic cobweb of sentiment, but an actual delivery of the goods. Service is not a word; it is a work. No longer do party platforms answer the demand for service; only party performance can do that.

This does not mean that the leopard has changed his spots. It would be very suspicious if it did. It does not mean that the old gang has had a change of heart. Such a profession would indicate a new phase of the old game. It means that while the old conservatism was engaged in building up its own interests, putting finance above everything else, making industry subordinate to dividends, reducing even the government to a small outside department of their business—and while the old radicalism was favoring the destruction of everything the old conservatism had built up, and denouncing every form of successful service as contaminated by "capitalism," and every successful man or even constructive man as an enemy of the people—it means that while these two parties were blindly milling at each other, both of them wrong, and each of them incited to greater wrong by its failure to analyze the other, there was growing up another generation, yes, two generations, which could sit as judge upon the question and hear both sides.

It is not too much to say that, in this country, *two generations* have considered the general economic points at issue. And out of these two generations have come some pretty clear basic ideas which have taken possession of that type of mind which in other generations might have become the best recruit of conservatism. These men have seen that the constructive principles of life are the ones that play fair with all sorts and conditions of men, and because they come of a constructive generation they naturally adopt constructive principles.

The best type of socialist (that is, the type of mind that has a sense of social responsibility and solidarity, as distinct from the crass selfist) and the best type of old-time conservative (who was not always a crass selfist but who saw the thing bigger than the man, the business bigger than the human beings involved) have both come to see that the truth lay between them, and can be brought to the surface only by a genuine spirit of service.

That expression, "spirit of service," sounds idealistic, like some high spiritual essence impossible to attain. The spirit of service is just a knowledge that no man can survive, no industry can survive, no government can survive, no system of civilization can survive which does not continually *give service* to the greatest possible number. The only interest anyone has in anything is the service one gets from it or gives to it. As normal creative individuals we are satisfied only with the service we render in our work; as members of civilization or government we are satisfied only with the measure of service they render us. How long would reading last, or religion, or farming, or anything else, if men were not thereby enabled to render and receive back again, service? So, there is nothing highfaluting about service.

Now, that is all that there is to the new conservatism; what the old radicalism could not do because it was not hitched to constructive purposes, what the old conservatism could not accomplish because it would not enlarge its principles of action, the new conservatism can and will do because it has joined the halves of principle which these two opposing groups possessed. Taking the best of each and being free of the animosities of class jealousies, the new group profits by the experiences and outlooks of both.

One thing is certain: both the old conservatism and the old radicalism are dead. They disappeared because each of them in its own way violated the law of service.

What will the new conservatism do in government? In the first place, it will get rid of the element of deceit. It will not talk to the ears of the people while working for the plans of the selfists. It will rid government of men who use it for special instead of general benefit. It will study legislation which touches business from an economic standpoint instead of the point of view of dividends to "friendly" interests.

The new conservatism in government will not promise that anyone can live without work or that all shall have castles, nor will it estimate the man who does better than his fellows as a menace. It has too much common sense for any of these things. But it will see that the groups that encourage waste, inefficiency, limitation of production, limitation of wages, limitation of opportunity, limitation of development in industrial processes, limitation of competition, or any other system founded on class selfishness, is a danger to the whole country. This applies equally to the man who withholds a day's work under union rules and the man who evades competition under tariff protection. They are both doing their bit to hurt the general welfare.

The new conservatism will understand that legislation of itself can bring no good economic condition into existence, but can only clear the way for it to come. The people are no longer fooled by the promise that a law made at Washington can bring prosperity to Nebraska. All that the law can do is to give legal standing and recognition to the people's conviction that fair play ought to rule equally everywhere. Much of our legislation is frankly class legislation, and not all "upper class" legislation either. This kind of legislation cuts across the path of natural law and creates artificial conditions. This the new conservatism will avoid. Whether it will be courageous enough to delegislate on myriad matters, take off the books the countless statutes that antagonize the natural and economic law, remains to be seen.

This new conservatism need not as yet be called Republican or Democrat. Which party will become its better vehicle remains to be seen. To become the channel of the new conservatism does not require a victory at the polls. Whichever party may win, the new conservatism will still control the country, if not within the winning party, then outside it. It is not always the Administration that rules. It is an Idea that rules, when there is one.

But it begins to appear that the Republican party, as a party and as a temper of mind, has gone farthest along the direction herein described. It may have its chance, and if it lives up to its opportunity in the new conservatism, its party life will be prolonged. If not, it will die the death of the old conservatism of which it was the vehicle, and of which shreds still cling to it. Democrats can best serve their party and the country by seeing to it that where Republicans fail to act upon the new idea, the Democrats shall fill up the lack.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Cleaning Out

RUMORS of dissension in President Coolidge's political entourage will be received with the greatest equanimity. Eliminating Mr. Wilbur and Mr. Stone from the count as being untried men as yet, the President has not been a conspicuous winner in picking men. His appointment of Mr. Slemp was the occasion of much surprise, but, at the time, the country was willing to allow a President to go any length in choosing the men with whom he was to work. Now that rumor declares Mr. Slemp is to go, there will be no general dissatisfaction and no curious inquiries as to the reason.

Mr. Coolidge's troubles are going to be with men. Some of the men he inherited. These ought to get out now, but failing that they should be put out before next March 4. The Cabinet would not be weakened if the present Secretary of War should betake himself out of office. There was no reason why John Weeks should ever have been given the war portfolio, and during his incumbency there have developed several reasons why he should not retain it. Some assurance should be given that, at all events, he will not remain over March 4. There are other Cabinet changes which ought to occur, but doubtless they will be taken care of in due course.

With Mr. Coolidge cleaning house, as it seems, the country should do likewise. In the presence of a Presidential contest the people should not forget that certain Senators are up for re-election this autumn, certain obstructionist Senators, whose careers have been long enough to classify them as hobby-riders without administrative ability or any of the qualities of statesmanship. A President should be given a House and Senate intelligent and patriotic enough to work with him. It is a drawn battle, no progress made, when the legislative branch and the Executive pull in different directions.

Maughan Does It

MARVELS crowd one another so rapidly these days that the sense of wonder is being numbed in men. It is easier to catalog the marvels of the last 500 years, than to give a list of the epoch-making discoveries of the last two years. Latest to come, though long implied in other achievements, is the flight across the United States from dawn to dusk. New York to San Francisco in less than one day—from 3 a. m. to 9 p. m. by sun time, or in twelve minutes less than twenty-two hours by Eastern time. That is the time on the way, but from Atlantic to Pacific Coast the time actually spent in flying was eighteen hours and twenty minutes. One man, one plane, one trip—the first transcontinental day. Thus the impossible of yesterday becomes the accomplishment of today, which tomorrow will be already stale. Lieutenant Maughan has cut a notch in the tall stick of aerial progress, but not the last nor highest notch by any means.

Treasury Serves Money Brokers

THE more the fiscal operations of the United States Treasury are studied, the more convincing appears the evidence that such operations are conducted in the interest of high finance rather than to the profit of the people.

To many who believe that the rise and fall in price of government bonds on the market is governed by fluctuations in their value, it would be enlightening to note that professional financiers hold no such mistaken idea. To them it is purely a game of chance, and business conditions afford them the opportunity which they use to make the most of the speculation.

C. Frederick Childs, in the *Central Western Banker* for June, succinctly states this theory of the relation of United States bonds to general business activity, illustrating the point that the Treasury is conducting its financing in a manner to permit high finance greatest opportunity to profit. He says:

> "The recent tendency of the market for all government securities has been due to the timidity of capital and lack of confidence respecting general political maneuvers. Capital recoils from venturing into enterprises which are sensitive to Congressional interference. The advance has also been helped by the reluctance of bondholders to sell and pay taxes on their profit, or reinvest the proceeds in other classes of securities."

The explanation thus made appears to cover up the real cause which seems to be indicated, it may be unintentionally, in what follows:

> "When industry slows down capital seeks a safe harbor until it may again be permitted to work unmolested and unafraid in business undertakings. Consequently idle money is temporarily invested in the safest of all securities—government loans. There is seldom an exception to this natural course of procedure. Government bonds, being in a class by themselves, move in an opposite direction to stocks and corporation bonds. As a general axiom: *Sell long-term bonds and buy short-term notes when money rates are low and prevailing prices high, and conversely, when money rates are relatively high and prices are low, buy long-term bonds and sell short-term notes.* That theoretical principle responds to every test and invariably proves true and profitable in practice. *The gamble consists in deciding when to act.* Similarly, when price levels on the stock market advance, reflecting business prosperity, *funds are withdrawn from government securities and reinvested in industry.*"

In the light of the continued issue of Treasury Certificates of Indebtedness, on short time and at unnecessarily high rates of interest, could it be plainer that the financing operations of the Treasury have been intended to provide a safe harbor for high finance when money is easy? The Treasury issues, now aggregating more than four billions of dollars, are absorbed by the speculators of the East where idle funds concentrate.

If agriculture, industry or commerce were thus tenderly cared for in the times of their depression, it would be denounced as class protection, and justly. When money brokers should be invited to use the United States Treasury as a storm shelter, it is also class protection. There might be a shadow of excuse for this situation if the Treasury had taken the opportunity to reduce the interest rate, but it invariably has placed its short-term notes at rates above the general offering for commercial paper of the same nature.

What is wanted is an administration of the Treasury always watchful for the interests of the whole people, not one so keenly alive to the desires of high finance.

As an instance of the program, the June offering of $150,000,000 in notes maturing in six months might as well have been carried to a term insuring their payment at maturity, at a lower rate of interest, when the chances are for their renewal at an even higher rate than now. The business man who would finance himself as the United States Treasury finances itself would be deemed crazy, but he does not exist.

Street Cars Continue to Vanish

THE traveler in interior America is always running across the abandoned tracks of local street railways in towns of from five to twenty thousand population. Adrian, Michigan, with the fifth oldest street railway in the country, is the latest to abandon that form of service.

Sometimes the tracks in the main street are still used by an interurban line that passes through; but usually the rails have been left in the street because it was cheaper to do that than to take them up and repair the paving.

Spurs of unused steam railroads sometimes appear. But usually there appears nearby a busy motor highway.

We progress by change. New and better transportation has been made available to all classes and they do not mourn the passing of cars on which people never rode with comfort nor with a large degree of service. The Toonerville Trolley will soon be only a tradition.

The New York Convention

AT THIS writing the Democratic Convention has been sitting for seven days and the end is not yet in sight. Its record is one which the stay-at-home portion of the party finds it difficult to defend. It was a mistake to call the Democratic Convention in New York City. Party managers were aware that the Convention was desired solely to bring the pressure of New York's East Side to bear for one candidate's interests and against another's. The result has been an outrageous use of the most vicious political implements, a purposeful resort to the most violent of passions, and a shameless attempt to subvert a political party that bears its name openly to a party that in this country dare not name itself.

For whole days together the Convention was little more than a religious riot. The religious element was deliberately injected by the New York group, who appealed to the prejudices centering in New York as against the opinions of other parts of the country. Much as Americans were desirous of divorcing the candidacy of Al Smith from his religious affiliations, they were not permitted to do so; and much as the Smith supporters desired to accustom the nation to presidential aspirations on the part of a Catholic, they failed to prevent bitter entanglement of that candidacy with questions of religion, which they themselves aroused, and which had no business in a political convention.

Denunciation of the Convention as a whole, however, would not be fair. Against the almost overwhelming torrents of prejudice and passion, Americans in Madison Square Garden had the strength to keep their feet and stand for the principles of Democracy as against those represented by Tammany—and these Americans were a majority. As a result New York was beaten on its own soil, but only after the New York element had resorted to tactics which will stain crimson the Convention record for many a year to come. Enough has transpired to warrant Democrats in taking stock of their partisan affairs. If the temper which was in evidence in the noise and strategy of the first seven days is representative of the controlling element of the party, the future does not look very promising.

Although the newspapers have not told and dare not tell the whole truth nor give clear descriptions of the positions and parties involved, the total impression which the Convention has made on the country has led people to ask, "Is the Democratic party made up of that heterogeneous mass? When we vote for Democrats do we vote for the same kind of prejudiced contention that made the New York Convention a nightmare?" This is certain to constitute an added burden in the coming campaign. How much of a chance the Democrats ever had of winning the coming election need not be speculated upon, but they certainly had every chance to make a telling campaign. That chance has largely been lost by the selfishness of certain influences who wanted to twist the Democratic party for their own uses. They were prevented, it is true, but the work of preventing them revealed the party in such a light as seriously to compromise its appearance in the coming campaign.

Two points are worthy of praise and attention. One is the courageous stand of William Jennings Bryan in the face of a howling mob as he pleaded for tolerance from intolerant New Yorkers who demand every tolerance for themselves and refuse any tolerance to others. Mr. Bryan truly threw it in their teeth that this noisy element calling for tolerance was never heard when the Democratic party was advancing toward any great moral reform. Against the phalanx of wet interests allied with religious intolerance and managed by the most unscrupulous forms of Tammanyism, this Nestor of Democracy spoke words which are full of truth and significance. His was an attempt on the part of a Democrat to save the party from those who wished to use it only as a stepping-stone. And though he helped secure an apparent victory, it was such a victory as discloses the terrible condition of the camp.

Another point worthy of commendation is the plank in the platform which calls for a non-political expression of the American people on the question of entering the League of Nations. A vote taken on the League alone, with no entangling and befogging candidacies or any form of partisan interest, is proposed. In such a plank the American mind in Democracy shows its breadth and quality. It is a proposal in which every American citizen can join. It is the presence of statesmanly views like this that renders so sad the rest of the Convention spectacle.

America's Wild Animals Preserved in Stone

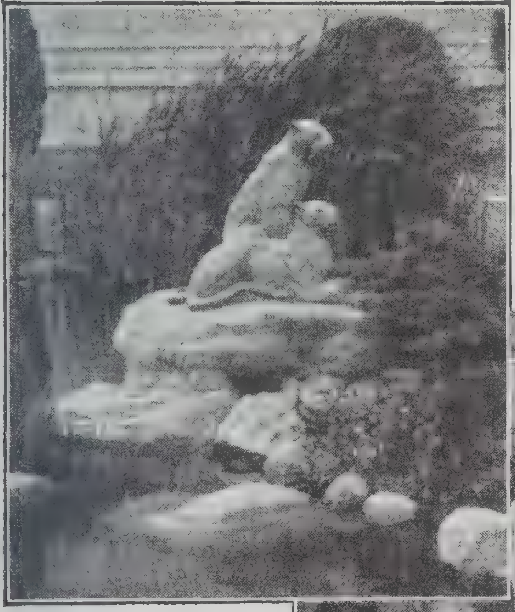
Transcontinental Traveler to See Creatures in Their Native Habitat

By ROBERT MORGAN

THE transcontinental motorist, following any one of the paved highways from the Atlantic to the Pacific, or the traveler on any railroad running across the United States, will rub his eyes with amazement when he sees on the plains of Nebraska or Wyoming groups of pronghorned antelope and herds of bison; in the slopes of the Rockies droves of elk, and on the crest of the Sierra Nevada pairs of grizzly bears and mountain lions peering at him from behind the boles of gigantic pines, or apparently crouched to leap upon him from some overhanging crag. All these wild animals will be in stone, and all of them will be there for the traveler of the future to see, just as the cross-continent wanderer of half a century or more ago saw them alive, if a plan now being given wide support by the governments of several of the western states, as well as the highway associations of that section is carried out.

The project, which was originated by Paul J. Fair, builder of educational exhibits for the United States Forest Service at San Francisco, is to preserve for all time all the larger mammals of the country in the form of bronze, marble or concrete—preferably concrete—statues, life-size and true to life in every detail. Bronze is suggested for the bison and the grizzly, as well as for the darker phases of the mountain lion and the elk and deer, but it is probable that colored concrete will be used for all. Experiments in the permanent coloring of concrete are now being carried on by Mr. Fair and others for this purpose.

All these animals are either extinct, as is the "silvertip" of California, or rapidly passing to extinction. Mounted specimens in the museums will last only fifty years at the most, despite the best efforts of the taxidermist, and living animals kept in zoos, or even on the great ranches of the West, do not reproduce themselves in sufficient numbers to insure that within the next twenty-five years all will not be extinct. Deer alone seem to have been able to survive the domination of man, and they are able to maintain their numbers only at the expense of the mountain lion, which is hunted down and slain by men employed by the state governments of California, Oregon and other western states. Motion pictures and still photographs will preserve to some extent the appearance and actions of these animals, but such reproductions deteriorate, the negatives become lost, and their exhibition is not general, but confined, for the most part, to those who are interested in wild animal and bird life.



Above—Mountain lions, carved in granite, and set in natural positions in front of a museum in Golden Gate Park, San Francisco.

At right—The Mountain Lion (puma) at home, from a mounted habitat group in the California Academy of Sciences at San Francisco. These mounted animals will endure about fifty years, when they begin to disintegrate, despite the best preservative methods of the modern taxidermist. It is proposed to replace them, in the mountains and on the plains of the West, with life-sized statues of the animals.

Above—PAUL J. FAIR, superintendent of educational exhibits for the United States Forest Service at San Francisco, and himself a wild-animal sculptor of ability, who originated the idea of preserving the larger animals of America in the form of statues to be set permanently along the highways of the United States.

Mr. Fair and other sculptors favor colored concrete as the best medium for the statues, although bronze, marble, granite and other materials have been suggested. It is estimated that the molding and placing of the figures will take about two years.

In order, then, to keep before all the people all the time the main features of the splendid wild life which once filled the mountains and valleys, the plains and the hills, of the West, it is proposed to set up statues of these animals, life-sized and in natural poses, painted in natural colors, in the sections they once inhabited. The idea has been taken up by the states by natural history societies, educational authorities, and sportsmen throughout the West, and the highway associations, as well as the motorists' organizations, have agreed to assist in establishing this zoological garden in stone and bronze extending halfway across the nation.

At the points where the transcontinental highways enter each western state, it is proposed to erect a lifelike figure of the animal most abundant in that state. Thus, where the Victory, Lincoln and other highways enter California from the east, a life-sized silvertip grizzly will stand, erect beside the road, turning over a concrete log, in search of small animals, reaching eight feet high, to leave its mark on the bark of a huge pine, or in some similar true-to-life position. At each road the grizzly, or the pair of them, if two are decided on, will be in different positions from those at the entrance of the other roads into the state.

Where the transcontinental highways enter Oregon, it is proposed to set up the black and brown bears in natural positions, and amid the surroundings in which they once flourished. Along the Columbia Highway, in Washington, it is planned to have mountain lions, singly and in pairs, since these large cats were, and still are, more abundant in that state than in any other, with the possible exception of Colorado. Along the borders of Montana, the elk will guard the highways, as in the days of half a century or more ago, he followed the trails. Wyoming still has grizzlies, of different type from the silvertip of California, and these will be reproduced in enduring bronze at the points on which the highways enter that state. For Colorado, like Washington, the mountain lion seems to be the appropriate animal, while the buffalo and the antelope will divide honors in Nebraska and Kansas.

Farther south, Arizona and New Mexico will have the jaguar—the great spotted cat still abundant in Mexico and Central and South America—and the mountain lion, while the smaller coyote will replace the gray wolf of the northern tier of states. Texas authorities prefer the buffalo, but the antelope has many supporters for the place of honor at the entrance of the main highways into the Lone Star State.

In the interior of the various states, it is planned to place statues of the animals which once roamed the various sections of that state, in natural positions along the highways. In the Sacramento River Valley, in California, for example, the elk, the bear and the mountain lion will be reproduced; in the Sierras will be the grizzly, the mountain lion, and the gray wolf; in the lower mountains, the coast ranges, will be the black and brown bear, the mountain lion, and, along the coast, the bear and the seal and sea lion, the latter in lifelike groups on coastal rocks and reefs.

Southward, the same mammals—with the exception of the elk and the seals—were once plentiful in the mountains, and to them are added the mountain sheep, the beautiful bighorn, now protected by law, with a few remaining in small herds in the desert mountains. Where the highways pass through cliff-walled canyons, it is proposed to place the animals on the crags and ledges, at such distance that they will appear most lifelike. To some extent this has been done in Golden Gate Park, San Francisco, and in some other large parks of the West, and the result has been a presentation of some animals, especially the mountain lion and the grizzly bear, in a most lifelike manner.

The method of construction of these figures for this nation-wide zoo is comparatively simple, after the models are made, according to Mr. Fair, who has calculated that about seven poses will be required for each animal. In his work for the Forest Service, he has made motion pictures of a number of the animals in the mountains and forests, and has other films made in zoological gardens and parks. From these the models for the animals can be made, and a number of large casts, either in bronze or concrete, made from each of the models. By scattering the several casts made from each model through widely separated parts of the country, the same animal in the same position will not be seen twice by any motorist or railroad traveler.

Contrary to general opinion, Mr. Fair, and other sculptors who have given time and consideration to the subject, believe that concrete, painted to represent the exact colors of the animal the statue represents, is better, more enduring, and can be made more true to life in every detail, than either bronze, marble or granite. He believes the concrete to be more plastic, and, if made waterproof, will require repainting only about once every five years. With it, too, the variations in the pelage of animals—such as that between the mountain lion of Washington and the same animal in New Mexico or Arizona—can be shown more realistically. With bronze, for example, the difference in color between the grizzly, the brown and the black bear cannot be indicated in color, but solely by the size, and the shape of the head, differences not readily apparent to the person untrained in natural history. With concrete, however, the color differences can be shown, even down to the shades of color of the eyes. Concrete also is approximately fifty per cent cheaper as a material for these stone zoological gardens than either the cast bronze or the carved marble or granite.

It is proposed to defray the costs of the statues of all these mammals by the sale of small bronze and silver replicas of them in the various states, and by funds subscribed by highway associations, and motorists' organizations, without calling upon any of the state governments for contributions. This plan has been adopted in Nevada for a similar purpose, to pay for the erection of a heroic statue of Mark Twain, on the summit of the Comstock Lode, where the famous humorist did his first writing. It also is being used to raise funds to cover the cost of a statue to Luther Burbank, to stand in the center of Burbank Memorial Park, at Santa Rosa, California, the home of the plant wizard. Both projects are proceeding successfully, and the models for both statues have been completed. It is believed that the idea of preserving the wild animals of North America for future generations would have an even wider appeal than either of the other statues.

An interesting technical feature is involved in the construction of the concrete statues of the animals in experiments now being carried on by Mr. Fair and others, looking to the coloring of the concrete before it is cast, so that painting, other than the possible darkening of certain sections, such as the back of the northern mountain lion, and the whitening of the tips of the hair masses on the silvertip grizzly, would not be necessary. The difficulty so far encountered is in the successful diffusion of the coloring matter throughout the concrete, but with the use of waterproof concrete and a special stone paint, also waterproof, recently invented by a woman in San Francisco, it is believed that this can be overcome, and the sculptured animal made of the same color throughout.

Models of a number of the animals, notably the grizzly, the mountain lion, the coyote and the antelope, have been made by Mr. Fair and other sculptors. Maps and photographs have been obtained from the California State Automobile Association, and other similar motorists' organizations throughout the West, so that locations for the first chain of animals have been made.

It is estimated that about two years will be required to mold, cast and set up these figures, and that approximately 200 of them will be required at the intersections of the interstate highways with the state boundaries alone, while as many more will be erected within the states.

Submitting to the Law

THE Continental Congress of 1776 met in Independence Hall in Philadelphia daily for five weeks, and was unable to adopt a single sentence of the Declaration of Independence, until Benjamin Franklin arose and, addressing George Washington in the chair, spoke as follows:

"In this situation of this assembly, groping, as it were, in the dark to find political truth, and scarce able to distinguish it when presented to us, how has it happened, sir, that we have not hitherto once thought of humbly applying to the Father of Lights to illuminate our understandings?

"I have lived, sir, a long time: and the longer I live the more convincing proofs I see of this truth, that God governs in the affairs of men. And if a sparrow cannot fall to the ground without His notice, is it possible that an empire can rise without His aid? We have been assured, sir, in the Sacred Writings, that 'except the Lord build the house, they labor in vain that build it.' I firmly believe this; and I also believe that without His concurring aid we shall succeed in this political building no better than the builders of Babel; we shall be divided by our little, partial, local interests, our project will be confounded, and we ourselves shall become a reproach and a byword down to future ages. And, what is worse, mankind may hereafter, from this unfortunate instance, despair of establishing government by human wisdom and leave it to chance, war, conquest.

"I therefore beg leave to move:

"That hereafter prayers, imploring the assistance of heaven and its blessings on our deliberations, be held in this assembly every morning before we proceed to business, and that one or more of the clergy of this city be requested to officiate in that service."

Thus spiritual law and history entered American politics and the Declaration of Independence was soon adopted.—*Enos Eli Sutherland*, in "Spiritual History and Destiny: Kentucky."

The German Rentenmark—How Was It Done?

Money Based on Real Wealth Gives International Finance a Scare

By WALTER M. WOLFF

SOMETHING has been done in Germany that financiers said could not be done. Without any great effort or ballyhoo Germany has established in the Rentenmark a monetary system *backed by the wealth of the nation* and apparently *independent of the gold standard.*

How was this new money actually established? What are its prospects of achieving the ultimate purpose for which it was created? Will it remain stable and avoid all the pitfalls of fluctuation?

To begin with, we shall endeavor to dispel a few erroneous notions still prevailing with regard to the German money situation. There are no gold marks in the German Republic today; the Rentenmark is the equivalent of a trillion paper marks which are still the legal tender of the land. Germany has three mediums of exchange at the present time: (a) the so-called but fictitious "gold" mark, (b) the Rentenmark, and (c) the paper mark.

Theoretically, all three are based on the gold standard: that is, on the old pre-war, gold-backed mark; *actually* they are all based, ultimately, on paper and nothing else.

Gold Mark a Myth

WHENEVER, therefore, a German speaks in terms of gold marks he means Rentenmarks or paper marks. The ratio between the merry trio might be stated thus: A trillion paper marks are equal to one Rentenmark which is the accepted equivalent of one "gold" mark which doesn't exist. We may assume, then, that one trillion paper marks are "just as good" as one Rentenmark which, in turn, is equally as good as one gold mark (which we have just said does not exist in Germany).

And why not? If everybody says so and *believes* it, it surely must be so. A wonderful thing, this gift of imagination!

Not by any law of supply and demand but by a decree of the Reichsbank one of these new "gold" marks (paper certificates) was declared to be the equivalent of one trillion paper marks printed during the years of inflation. Its face value was declared, for the sake of convenience, to be 23.8 American cents, the value of the pre-war gold mark. Every German "gold" mark note read: Twenty-one marks equals *five dollars;* eight marks, forty pfennigs equals *two dollars;* four marks, twenty pfennigs equals *one dollar*, and so on. The idea was perfectly legitimate and acceptable with the sole exception that few persons ever succeeded in cashing *one* of these "gold" notes for *one* real, honest-to-goodness American dollar; whoever took the stuff at face value was considered to be either a philanthropist or a fool. So much for the "gold" mark. Our main purpose is to comment upon its "better half," the Rentenmark, and we shall confine our attentions to it exclusively from now on.

Abroad, and to a large extent in Germany, there has prevailed a misconception of the financial reform undertaken in the Reich. It was generally supposed that a new currency was being introduced to displace the old paper mark—that it should begin immediately to retire the old scrap from circulation. Paper marks had become so thoroughly discredited that only proposals which promised their speedy removal could have commanded any sympathy and support of public opinion. No one believed that a brand new currency could be established overnight, so to say, but it was thought that the Rentenmark might first assume the position of a parallel currency, and by gradually increasing the scope and importance of its function as a medium of exchange it would be ultimately adopted for all business transactions. The paper mark should disappear gradually and unobtrusively. However, the chief purpose of the Rentenmark was to give the German Government the long-desired opportunity of balancing its budget and stopping the printing of paper marks to meet current deficits. But the Rentenmark can never entirely abolish the old paper mark because the paper mark must remain for the calculable future, at any rate, the basis of the German monetary system. This statement should be borne very clearly in mind. The German "gold" currency or "gold-backed" currency—be it called Rentenmark or Festmark or *wertbestaendig* or what not—is a myth so long as the latter cannot be liquidated or redeemed at least to a certain extent in gold.

Rentenmarks Based on Rentenbonds

THE idea of the Rentenmark owes its origin to the finance minister of the Stresemann Cabinet, Hilferding. On October 20, 1923, the Renten Bank was founded and began business on the fifteenth of November.

The new institution started out with capital of 2,400 million Rentenmarks *subscribed wholly from private sources*—one half by agriculture and one half by trade, commerce and industry.

The capital was paid in by means of a gold mortgage on agricultural real estate amounting to four per cent of its value, and calling for payment of six per cent interest. Industry and trade paid in their share of the capital either with a similar mortgage on their real estate or by promissory note, the mortgage or promissory notes reading in gold marks. Of course, the gold mark does not exist in Germany as a medium of exchange as has already been mentioned but it is assumed or universally understood that it does exist as a *standard of value* and as *an accounting device* for insuring an equality in the gold value between the debt when contracted and its payment when due.

The above mentioned obligations were divided into Rentenbonds in denominations of 500 gold marks or more and pay five per cent interest. On the basis of these bonds the Rentenmarks were issued. By law Rentenmarks may not be issued unless for every 500 of such Rentenmarks there is as reserve in the Renten Bank a 500 gold mark Rentenbond. The Rentenmarks are redeemable in that every holder of 500 Rentenmarks may demand in exchange one of the gold mark five per cent Rentenbonds. Rentenbonds, however, have no definite date of maturity and the Renten Bank at no time can call in the principal of the mortgage. Rentenbonds may also be repurchased from investors by the bank at its option five years after the bond is issued. It will be observed that the Rentenmark involves no obligation on the part of the government for redemption; nor is the Rentenmark stated by law to have a definite gold value. It has, nevertheless, been issued on a parity with the gold mark and is expected to maintain that equivalence since it is secured mark for mark by a gold mark obligation.

The plans developed about as follows: On November 15, 1923, a sum of 1 200 millions of Rentenmarks was placed at the government's disposal and on that day the issue of paper money for the purpose of discounting the treasury bills of the government apparently ceased. Of these 1,200 millions, 300 millions were to be used to repay the government's floating indebtedness and the remaining 900 millions (which run for two years at six per cent interest) were to be used to meet the deficits of the budget until the government was able to place that tax system upon a gold basis and was provided with sufficient receipts from these sources to meet its outlays. The other 1,200 millions of Rentenmarks were placed at the disposal of the nation's commercial and industrial interests.

The sponsors of the Rentenmark hoped to bring about several badly needed, noteworthy improvements through the establishment of the new monetary "bridge." Chief among these were the following:

1. Furnishing the community with a stable medium of exchange.
2. Establishing a money that could be laid away or saved.
3. Permitting the moving of the crops.
4. Retiring the paper mark from circulation.
5. Meeting the deficit in the national budget until it could be balanced by income from taxation.

Security, Public Faith and Confidence

IT MAY be said in all good faith that *to date* the Rentenmark, in bringing about the foregoing improvements, has had unusual success from the start. *Several attempts have already been made, to be sure, to undermine its stability* but it has weathered all storms and remained undefiled *thus far.*

And why "thus far"? Is there any imminent danger of an ill wind damaging the good reputation of the Rentenmark? Is its life really in jeopardy? We shall touch upon these questions more or less in the light of recent developments within the fatherland.

We will remember that the state has assumed no obligation of redemption and the Renten Bank is not obliged to redeem the Rentenmark except with a Rentenbond. But this bond has no definite state of maturity. The purchaser, if his interest is not paid, cannot foreclose on a specific piece of land or sue the Renten Bank for his principal; and the Renten Bank at no time has the power to call upon the mortgagor for the payment of the principal of the mortgage. It can only foreclose on a specific piece of land if the mortgagor does not pay his interest. The holder of the Rentenmarks, it is true, can demand and obtain a Rentenbond but as the holder of a Rentenbond he has a legal right only to his interest. He can regain his principal only by selling his Rentenbond on the bond market (which buys only at a considerable discount on account of the severe tightness of the German money market today).

What, then, becomes of the security of the combined German real estate which has been the greatest advertising feature of the new currency? It is the security of receiving an annuity, merely, and of selling it as an ordinary annuity on the open market. If the provisions of the law are faithfully observed by the government, and the private property system continues to prevail in Germany, there is no reason why the holders of the Rentenbonds should not receive their interest regularly and look forward to the liquidation of the Rentenbonds at par by voluntary act of the Renten Bank within the estimable future. But if anything happens to prevent such liquidation the bond holders have no right to foreclose on the land and can look forward to no definite date in the future on which they are legally entitled to payment.

The chief security behind the Rentenmark or any other monetary unit (whatever its name may be) which Germany may introduce in the future is nothing else than *pure public faith and confidence.* Faith and confidence, in turn, must emanate from an honest, promise-fulfilling government and must be kept absolutely clear of the wily intrigues of the private money lenders and other financial and industrial parasites whose sole mission on earth seems to be centered in squeezing out the nation's profits at the expense of the masses. Therefore, despite all its collateral security and good advantages, the moment the *confidence* in the new currency has been sufficiently shaken or Dame Rumor succeeds in turning the heads of the people and the speculators alike—the Rentenmark is through! But so long as this balm of faith persists and rumors to the contrary die a natural death, the Rentenmark may continue to prosper for a very long period without actual gold security: that is, redeemable gold security.

The gravest rumor which has persisted to this day, and one which may possibly have several grains of truth in it, is the story that the Reichsbank, having exhausted its entire quota or loan of Rentenmarks, had again resorted to the printing, temporarily, of additional paper marks or money having almost no material or physical security whatever. *Money lenders are asking and getting as high as 120 per cent and more a year on loans in Germany today on account of the acute shortage of money.* If the Reichsbank does not clamp down the lid very tightly on promiscuous credit extension; if it seeks to relieve the tightness on the money market through the promulgation of a second inflation, however mild—good-by Rentenmark! Granting, however, that nothing untoward happens along the lines aforementioned, the present Rentenmark should some day develop into the true gold mark—the kind of gold mark which in 1914, even though of paper (gold certificate), represented a goodly bit of the actual metal or the equivalent deposited in the vaults of the Reichsbank.

Stability Dependent on Many Factors

THE fact that Germany's exports during recent months, while by no means in excess over imports, have constantly increased, is also an important item contributing to the continued stability of the Rentenmark. If, then, a more favorable trade balance can be established and maintained, and the national budget may look forward to a surplus within the calculable future; if gold can be introduced into the country in ever-increasing amounts—then the Rentenmark may be considered as resting on a firm foundation. Nevertheless, there are so many factors which bear upon the future welfare of Germany and directly or indirectly upon the Rentenmark, such as internal political discord, trend of foreign policy, disposition of France and the Allies toward Germany, and so on *ad infinitum*, that unforeseen difficulties may drop out of a clear sky at any moment to change the entire aspect of the situation.

The statement has often been made in financial circles and elsewhere that neither the Renten nor any other mark currency can be made absolutely stable except when backed by actual gold, the most decisive factor in bringing about the fall of the present Rentenmark being the non-liquid condition of the securities upon which it was issued. So long as gold is the monetary standard of the world (so this cult goes on to say)—and so long as little or no gold appears in Germany it is very doubtful if any so-called "gold mark" issues could be stabilized at par even though the marks were backed by first-class mortgages on property and industries against which no other liens existed: for the reason that foreclosure, the last refuge of the mortgage holder, would yield nothing more than the property or industry itself, which would be as much of a white elephant on the hands of the mortgagee as on the hands of the mortgagor. Attachment and sale would only leave the mortgagee with a handful of unredeemable paper.

How Long Will It Last?

ASSUME that a man holding a heavy mortgage wished to liquidate or was forced to foreclose, the argument states further. There being practically no gold in the country he could not hope to sell or transfer his mortgage for anything but paper as worthless as the mortgage itself, nor to obtain in the case of an attachment and sale anything more valuable than his mortgage which had become worthless. Apropos of the foregoing, the following statement was recently made to the writer which "says a mouthful":

"The war with its aftermath of economic ills has been a liberal education to the masses in matters of public finances and people have learned that running a government is in practice nothing more nor less than running a great business. The German people and those of other nations as well have learned that a promise to pay, or to do anything else for that matter, is not 100 per cent certain of fulfillment simply because a government makes it; and certainly not a promise to pay when the government that makes it is not being run on sound business principles."

In conclusion we may say, then, that the Rentenmark at best is strictly a fiduciary medium of exchange. The most interesting feature about it is not, perhaps, so much "How was it done?" but "How long will it last?" The Rentenmark will last: that is, the bridge across the paper sea to the golden gates (if we may say so, figuratively) will be strong enough to withstand the current vicissitudes in Germany just so long as Germany plays the game straight; just so long as Germany is left untampered with by foreign intervention and red tape; just so long as common sense and business ethics hold free reign. Petty politics and Old Man Privilege must be met with a curt and emphatic "Hands Off!"

Here Is the Testimony: You Be the Jury

A Little Difference of Opinion on What We Said and What He Said

On April 26 THE DEARBORN INDEPENDENT printed the following editorial:

WHAT OF THAT "SURPLUS"?

THE Treasury Department announces the offering of $400,000,000 certificates of indebtedness, running for one year at four per cent. This amount, in addition to collections on March 15, is announced to be necessary to meet interest and maturities on the public debt for the March account. It is further announced that additional financing will be necessary in June.

To those who have accepted the statements of the department that the revenues have so far overbalanced requirements as to leave a surplus of more than $300,000,000 for the current fiscal year, the announcement must cause surprise. We have been told that the public indebtedness was reduced to the amount of practically a billion dollars during the year, and while it is generally understood that this means simply that present available funds are merely offset against the aggregate debt, the showing was creditable. But as the new offering is made with the expectation of using also such funds as are available, it will be seen that when disbursed the total indebtedness will not have been reduced at all.

The people are entitled to accurate knowledge of the condition of the national finances at all times. This new issue will pass the three billion mark in short-term securities issued since the advent of the present administration, not including savings certificates which do not represent an indebtedness of full face value until maturity. As to how many of these are outstanding, it is doubtful whether even the department has positive knowledge.

On May 9 THE DEARBORN INDEPENDENT received a letter from the Hon. Joseph W. Fordney whose name is widely known in connection with the tariff legislation of this nation. The letter follows:

May 8, 1924.

THE DEARBORN INDEPENDENT,
Dearborn, Michigan.

Gentlemen:

I read your paper and while we do not always agree, most times we do. In your issue of April 26 you printed an article, "What of That Surplus." I thought you were wrong and had made a mistake which would mislead a lot of your readers. Consequently I wrote to Mr. Mellon to set us right. He did so under date of April 29, which letter I found on my desk when I reached home last night. I know you want to be right and it seems to me you should publish Mr. Mellon's letter, with an acknowledgment of your error. The correspondence could be published elsewhere, but I have always thought that an open confession made one stronger with his friends. I trust you take the same view of the matter.

With kind personal regards, I am

J. W. FORDNEY.

This assumption of error is somewhat premature inasmuch as the accompanying copy of a letter from Secretary Mellon does not answer the question of the editorial nor dull its point.

The Secretary of the Treasury Writes

April 29, 1924.

My dear Mr. Fordney:

I have your clipping from THE DEARBORN INDEPENDENT. This editorial shows a fundamental misunderstanding of government finance. On each quarterly tax payment date only sufficient money is borrowed to meet current obligations and to carry the Treasury over until the next quarterly tax date. Automatically any surplus moneys in the Treasury go to the reduction of debt, and on the particular date, March 15 last, the Treasury paid off $550,000,000 of maturing certificates and issued $400,000,000 of new certificates, a reduction in debt on that particular day of $150,000,000.

The total amount of certificates outstanding is the criterion, and not the amount of such short term certificates that may have been issued during a period of years, since the certificates have a maturity of not more than a year. During the current fiscal year, commencing July 1, 1923, to April 26, 1924, there have been issued $1,735,827,000 of certificates of indebtedness, and paid off $2,015,071,500.

The intimation that the Treasury does not give the people accurate knowledge of the condition of national finances at all times is wholly false. Each month there is published a statement of the public debt of the United States, a copy of which as of February 29, 1924, is herewith inclosed. This shows every obligation of the United States outstanding. Daily there is published a statement showing current assets and liabilities, analysis of receipts and expenditures, and an analysis of the public debt receipts and expenditures. I believe that no other country in the world gives such complete and current information as is given by the Treasury.

Very truly yours,
A. W. MELLON,
Secretary of the Treasury.

Mr. Joseph W. Fordney,
Saginaw, Michigan.

Do figures frighten you?

If so, you miss a good deal of information and put yourself at the mercy of all kinds of loose statements.

However, there is more than figures on this page. There is a little argument between the Secretary of the Treasury, Joseph W. Fordney, the nationally known tariff advocate, and THE DEARBORN INDEPENDENT.

All three have their say here—

But the figures decide.

Read them, and in any case, you will learn something about your country's purse.

It now remains to see which party is deluded in this matter. Out of regard for the present numerous troubles of the Secretary of the Treasury we shall not deal with his expressions, "fundamental misunderstanding" and "wholly false." We shall deal exclusively with the figures published by his department.

Four questions are involved: Has the amount of revenue received by the government been sufficient to

(a) meet the needs of the Treasury Department?
(b) pay all current expenses of the government?
(c) pay all interest on the public debt?
And—
(d) reduce the public debt approximately a billion dollars during the fiscal year 1924 as claimed?

Turn to the daily statement referred to by Secretary Mellon.

April 30, 1923, page 1—Balance today	$393,122,954.43
April 30, 1924, page 1—Balance today	$331,725,401.58

The balance in the Treasury on that date in 1924 was $61,397,552.85 less than it was the same date in 1923.

Is a "Balance" a "Surplus"?

NOW a *balance* is not the same thing as a *surplus*, and it is decidedly misleading to talk or write as if it were. The Treasury of the United States should have some *balance* all the time. When it does not, it is in very bad shape. If the daily balance should at any time show say, $300,000,000 more than the fair, average balance which the Treasury ought always to have, it might then be permissible to talk about a "surplus." But as between the above dates, not only did no *surplus* appear but the *balance* actually decreased. On April 30, 1924, the Treasurer could have checked out $300,000,000 more than he did, if what he had on hand was *surplus*, and reduced the public debt by that greater amount. But he did not, and doubtless he followed good policy in not doing it. Had he done so, he would have had more than $31,000,000 left—and would he have described that as balance or surplus? As *balance*, certainly.

Now, turn to page four of those daily statements under the heading "Preliminary Statement of the Pubic Debt," with the subtitle, "Bonds."

April 30, 1923—Total bonds	$16,636,329,080.00
April 30, 1924—Total bonds	$16,154,393,990.00

On the face of it there would seem to be a reduction of the nation's bonded indebtedness in one year amounting to $481,935,090.00.

"On the face of it." But a man who had doubled his debt to Peter to wipe out his debt to Paul would hardly be credited with having decreased his indebtedness. Drop down to the tabulation under "bonds" and you come to the sub-title, "Notes."

Treasury Notes outstanding April 30, 1923	$3,522,470,600.00
Treasury Notes outstanding April 30, 1924	$4,046,398,000.00

Here we have an *increase* of $523,927,400 in this form of debt in one year.

That is, the increase in Treasury Notes was greater than the decrease in Treasury Bonds, which leaves the debt greater than it was the year before.

Furthermore, *these Treasury Notes bear a higher rate of interest than did the Liberty Bonds which they retired.* Here is the list:

Series	A—1924,	maturing	June 15, 1924, 5¾%
"	B "	"	September 15, 1924, 5½%
"	A—1925,	"	March 15, 1925, 4¾%
"	B "	"	December 15, 1925, 4⅜%
"	C "	"	June 15, 1925, 4½%
"	A—1926,	"	March 15, 1926, 4¾%
"	B "	"	September 15, 1926, 4¼%
"	A—1927,	"	December 15, 1927, 4½%
"	B "	"	March 15, 1927, 4¾%

Here we have the spectacle of our Treasury Department retiring lower interest-bearing debts by taking on higher interest-bearing debts, and that at a time when our investment bankers appear to be swamped with money and credit! It is not what would be precisely judged as expert or economical refinancing.

Now look at the Treasury War Savings Certificates, all of which are *debts* that the government must pay:

War Savings Certificates, April 30, 1923	$326,264,685.41
War Savings Certificates, April 30, 1924	$402,994,741.20

These figures show an increase in this form of debt for the year amounting to $76,730,055.79.

In these two items alone (Treasury Notes and War Savings Certificates) we have an increased indebtedness of $600,657,455 to set off against the boasted decrease in bonded indebtedness of $481,935,090—which leaves $118,722,365 on the wrong side of the ledger.

Now, with these facts in mind, where do we look for the "surplus"? It is true that the total bonded indebtedness of the United States at the date given for 1924 is less than it was in 1923, but what makes it less? The figures are as follows:

Total interest-bearing debt April 30, 1923	$22,327,078,565.41
Total interest-bearing debt April 30, 1924	$21,353,363,231.29

The decrease amounts to $973,715,334. Or taking the figures of the gross debt, that bearing interest and that bearing no interest, the reduction seems to be $1,031,177,306.49.

At the end of April, 1924, the figures still stood:

Total gross debt	$21,614,442,829.25

The question of the editorial still remains: "What about that surplus?"

Secretary Mellon makes a statement in his letter which deserves attention on the score of accuracy. In correcting what he calls "a fundamental misunderstanding of government finance" he says:

> "On each quarterly tax payment date only sufficient money is borrowed to carry the Treasury over until the next quarterly tax date."

Does the Secretary fail to remember the September call for four hundred millions which was subscribed to eight hundred millions, and he accepted it all—twice as much as he said he needed?

Observe again the table of Treasury Notes given above. Note the date of their issue and the date of their maturity and see if it is a fact that the Treasury refinances itself only for quarterly tax payment periods A sum of $2,830,700,900 extends into the years 1925, 1926 and 1927. Perhaps the Secretary meant that he does hand-to-mouth borrowing as well as long-distance borrowing. Whatever it may be called, it is all his own policy, for he is now in his fourth year of office.

One will search the daily statement of the United States Treasury submitted in this controversy, and not find the remotest clue to an answer to the question: If the gross debt was reduced $1,031,177,306 in a year, where did the money come from with which the reduction was made?

It did not come from the ordinary receipts of the government as this record shows (page 2, report of April 30, 1924):

Excess or ordinary receipts over total expenditures chargeable against ordinary receipts	$257,518,616.61

Does the Secretary Make Out His Case?

CERTAINLY, the clue isn't there. The sum isn't sufficient to account for anything.

On June 15, 1924, the sum of $311,088,600 is *due and payable* on Treasury Notes, Series A-1924.

On June 16, 1924, the sum of $135,128,500 is *due and payable* on Treasury Certificates, Series TJ-1924.

Here is nearly another half-billion dollars due—since the boast of a "surplus" was made—and was there a surplus to meet it? No. The Treasury borrowed $150,000,000 *for six months* at a higher rate of interest than was charged for commercial paper at New York.

The search through this report for the source of the alleged reduction of the public debt ends in failure.

There is one more possible source: maybe it was in economy that this money was saved. There was an increase of $55,019,751 in receipts and a decrease of $64,822,891 in expenditures, which together make $119,842,642—but even that is insufficient to account for the claimed reduction. And as to the "economy" involved, the reports of the condition of our Navy, the inefficiency caused in several quarters by inadequate appropriations, effectually quash that hope.

The fact is, Secretary Mellon's letter does not answer the question, nor does it turn the point of the editorial.

We shall wait to see what further "financing" the Treasury may have to do to get through the year, and then the story will be more complete. In the meantime, this fuller statement of the elements involved clearly shows that instead of THE DEARBORN INDEPENDENT being wrong, it was altogether too charitable. The paper may have had an erroneous idea of the financial policy of the Treasury Department, but only because it assumed that that policy was such as sound business men usually adopt.

One thing is certain, you cannot reduce debt by refunding it at higher interest rates.

And the debts you retire by such refunding are not "paid."

And the money you may have on hand by such methods is not "surplus."

"Just Prospectin'"—

Romantic Calling Whose Followers Are Fast Disappearing From Western Life

By JOHN ANSON FORD

Sam Dean and his faithful burro "Red." I asked Mr. Dean where he was bound for and with just a touch of pathos in his voice he answered, "Oh, driftin' north."

ROAMING the western hills from British Columbia to Mexico are members of a strange, romantic fraternity. They are distinctive of the present generation and the one which has just passed, and their like will never come again. No formal bonds or insignia mark their numbers, but in their hearts are the springs of brotherhood. Generous, courageous, carefree, they follow lonely trails which bring them little else besides a meager living, and a quaint philosophy. They are the old prospectors of the West.

Now and again their patient search is partially rewarded, and with their gold they descend to the towns to replenish their simple stores and renew their touch with civilization. But they never linger long, for the lure of the hills is upon them. For them life consists not so much in finding, as searching.

Not only do these men form one of the most picturesque elements in the life of the West, but they are of special interest because of the great wealth they have laid bare for others. They are the men whose wanderings among the mountains have revealed outcroppings of wonderful veins, which in turn have been developed with the aid of skill and capital. Rare indeed is the prospector who has retained more than a small share of any truly big strike.

Now that the motor car is penetrating into the primeval fastnesses there are more opportunities of coming in contact with these lone adventurers than there were a few years ago. Two summers ago, for example, an early spring day found us motoring over the rocky trail which leads from Las Vegas, Nevada, to St. George, Utah. It is the same route that the Mormons traveled in their march beyond Salt Lake so many years ago, and time seemed to have improved that track but little. But we forgot the road in the grandeur of the scene which we were entering. The rugged hills and gorges all about us looked as though they had emerged from some vast furnace and were still glowing red with the heat to which they had been subjected. The canyon through which our ribbon of a trail led had been rightly named "The Valley of Fire."

Shortly after we entered the portal of this weird valley we spied, far down the road, a slowly moving object behind which rose a languid cloud of dust. As we drew nearer we saw that there were two separate objects—a man and a burro. In a few minutes more we had drawn up by the side of the road opposite the dust-covered traveler and his heavily-laden beast.

"Jest prospectin'," he drawled. "Bound fer them hills off to the right." He waved his hand in the direction of a low range of mountains whose base was shrouded in blue haze. "There's springs in that range and I reckon there's real dirt there too. That's what I gather."

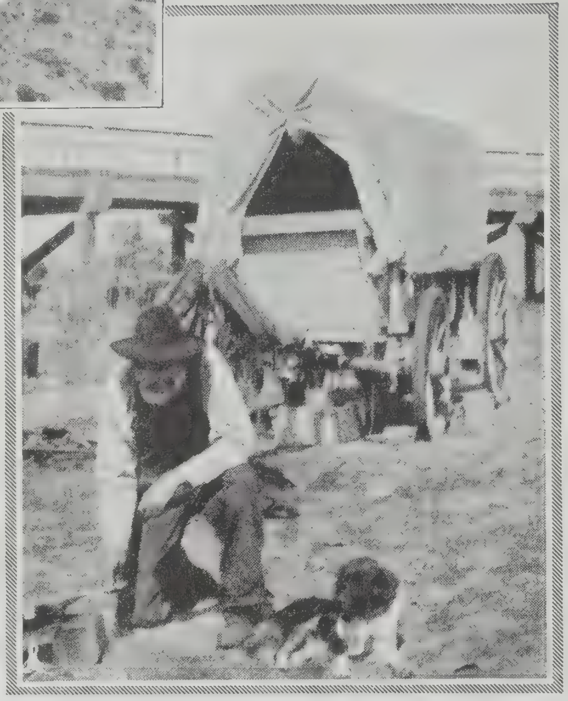
He seemed to think this explanation was adequate and forthwith changed the subject, evidently not desiring to be questioned too closely about the goal he was headed for.

"By the way," he went on, "I see you have a camera. Would you mind taking a picture of Bess?"—pointing to the little burro whose ears came to attention at the sound of her name and scarcely reached above the sagebrush.

At once it was apparent that there was a close bond of affection between these two. "I'm all broke up," the prospector said simply, "You see, I lost Molly a few days back. Finest little animal you ever saw. Just a mate for Bess, here. We three have traveled hundreds of miles in this God-forsaken country. Bess and Molly meant everything to me." And with that his voice faded away into a quaver.

So I got out my camera and tripod and photographed the bereaved Bess and her sad master. The annals of the early West are rich with examples of such affection between man and beast. Weeks and months of companionship in the lonely hills many times have fostered an affection and loyalty which have resulted in a ready sacrifice of life itself for the sake of a comrade. There is something in the solitudes of the vast open spaces which gives these wanderers a finer perspective. Life for these hardy men becomes far more precious than wealth—which may account for the prospector's contentment with but little of this world's goods.

But one should not suppose that these men are without friends just because they live a lonely life. There is Dad Fairbanks, for example, whose name is almost a household word in a region extending hundreds of miles up and down Southeastern California and into Arizona and Nevada.



James D. Roberts, hale and hearty at 75, on his way to a claim in Mexico, with his covered wagon.

Everybody respects "Dad," as he is affectionately called. His tall sinewy frame and swinging gait is known at every desert railway station, Indian trading post, desert mine and water hole throughout that most mysterious and forbidding region—Death Valley. Long before the Tonapah and Tidewater Railway tapped the region lying to the west of this awesome country, "Dad" had prospected its mesas and canyons. Many a time he has felt the thrill which only prospectors know when they believe they have struck it rich. Dad's eyes have been keen, and he has more than ordinary knowledge of geology so that when he has set up his four "monuments" to mark the four corners of his claim he usually has known what he was about.

For some years now he has retired from active prospecting and lives at the desert station of Shoshone where he has maintained a general store and an outfitting depot. Here many a miner has been grubstaked and gone off into the desert for weeks and months in search of his fortune. But even in recent years Fairbanks has found advancing age no serious deterrent to roaming the hills. Not so many months ago he disposed of a claim containing valuable filtering clay for a consideration said to be $30,000.

There are many who have not been as wise and fortunate as Dad Fairbanks. "Shorty" Harris spent his life on the desert and on more than one occasion he had vast wealth within his grasp. He was, in fact, the discoverer of the famous Bullfrog ore and so named it because of the peculiar hue of the precious stuff. And yet "Shorty" received but a pittance compared with the riches he uncovered for others.

Not long ago, while motoring southward from the romantic town of Monterey, California, I suddenly drew up beside the road as I caught a glimpse of a covered wagon half hidden by mesquite in a dry wash. Turning the car about I made my way through the chaparral to as pretty a camp site as any prospector could wish.

In the center of a little clearing were the smoldering embers of a campfire. At one side stood the weather-beaten wagon, its bowed canvas top for all the world like a bit of '49 history. And best of all there appeared in the puckered opening of the wagon the kindly bearded face of a real prospector. James D. Roberts is his name, but folks who know him call him Jim. Powerful of frame and standing six feet three in his stocking feet, his erect carriage and alert eye belie his seventy-five years.

We talked long there by the smoldering fire, made friends with his dog, and learned something of the dreams which were still leading this man on and on. It was the old story. The big kindly man supposed that it was the lure of gold—this time it was a claim in Mexico which he was headed for—but what really kept him prospecting was the free, open life which results from answering the call of the great out-of-doors. There is a charming open-heartedness and friendliness about these men who have long since learned to banish sham and formality.

"Do you know," Roberts confided, "I figger I've about lived my life even though I'm still pretty hale and hearty. But I guess—I guess—I'm just looking for a nice quiet place, now, where I can lay down when the end comes."

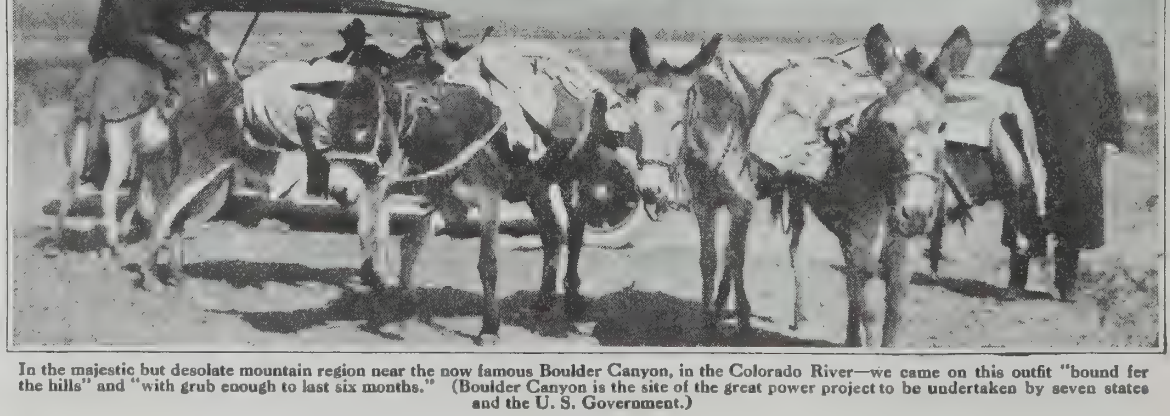
He looked off toward the hills and I thought there was a mist in his eyes. His hand reached down and patted the head of mild-eyed Prince who had come close up beside his master. "And by the way," Roberts continued, "would you mind sending me a couple of pictures for, for, my daughter. I reckon it would do her heart good to hear from her old dad."

There it was, the undying spark of tender sentiment concealed beneath a rough exterior. One finds it in all these men who have lived without illusions, excepting, perhaps, that of the pot of gold.

But there is also a very practical side to these prospectors. They are the ones who have really "opened up the country." Next to the Indians who once roamed all the West, but have long since been confined to their several reservations, there have been no men who have known the West like the prospectors. Many a delightful glade which now is a popular resort was originally made known to civilization through the wanderings of these men. The history of countless mines which have yielded millions has its beginnings in the discovery by those who have literally combed whole mountain ranges in search of golden outcroppings.

To be sure, they are often unlettered, and their knowledge has been limited to an interpretation of certain surface signs. The experienced mining engineer representing some large development corporation has been the one on whom they have been dependent for selling their claims.

Oftentimes these followers of the endless trail have



In the majestic but desolate mountain region near the now famous Boulder Canyon, in the Colorado River—we came on this outfit "bound fer the hills" and "with grub enough to last six months." (Boulder Canyon is the site of the great power project to be undertaken by seven states and the U. S. Government.)

little more than enough to pay the necessary government fees when they discover an outcropping that looks promising. They know nothing about scientific big scale mining. The sinking of great shafts with attendant exploration in various directions, according to the conditions revealed underground, is in most cases far beyond their understanding. When these prospectors make a real find they are almost always forced to sell it for what some developing company will offer them—and usually the company knows much more accurately than they what the claim will yield.

There are exceptions, of course. In and near Death Valley there are wonderful deposits of talc, borax, and so forth. If the full history of the valley is ever written it will tell of more than one seasoned old prospector—often a Scotsman—who has held onto this claim or that until he has obtained the $50,000 or $100,000 he has demanded. "Borax" Smith, made famous by the Twenty Mule Team product, is one of the men who realized large returns on a rich find, but this was partly because of his ability as a business organizer.

A pair of old prospectors photographed near the south end of Death Valley. The picture might well be called "Recollections of '49."

The procedure which was followed in the old days, and to a certain extent still obtains when a prospector discovers real unclaimed wealth in the earth, is as follows: First of all he stakes out his claim, perhaps 1,500 feet long and 600 feet wide. Its boundaries he marks with four piles of stones, one on each corner. He then prepares an ancient tin can or other receptacle, putting in it a simple statement that this is his claim. This is placed within one of the "straddle bugs" as the stone piles are sometimes called. If the claim is located in a wooded region its four corners may be marked by blazing as many trees and writing the proper notice on the smooth exposed portion of the trunk.

It then becomes necessary to have the claim surveyed by a government mining surveyor. The prospector is then in a position to file a certified copy of his claim's location containing a detailed description of it. Woe unto the man who jumps a claim. It is a game which many tried in the earlier days, but few survived to enjoy the fruits of such trickery.

Not infrequently one finds a prospector who has abandoned even the illusion that some day he will find and acquire great wealth. A few weeks ago, not far from Porterville, California, we came upon such a traveler. He was a small man, not much taller than his faithful burro whom he called "Red," and his name was Sam Dean. Dusty with many miles of travel, both man and beast had taken on the hue of the desert and only a discerning eye could detect these two in the distance. I should like to have examined the contents of his boxes and duffle bag on the back of "Red," but contented myself with a friendly chat, and he volunteered no information as to what success he had had in his gold hunting.

I think, however, that Sam's pot of gold and his rainbow had long since vanished and he was "jest livin'" along life's quiet pathway. He had tramped all the way from Missouri, he said, and aside from an opportunity to get a good bath, his chief desire was to find a good camp ground each night where he and the knowing little burro could rest and push on for another day's tramp. Sam's attitude was quite similar to that of another of his fraternity whom a friend of mine met high up in the mountains east of Lake Tahoe.

"Where are you going, Dad?" my friend asked as the two drew up to the side of the road.

"Why, I'm goin'—I'm goin'—well, I'll be dinged if I know where I'm headed fer. I'm jest prospectin' fer gold!"

But Sam had a place he called home, and though he had not been there for years he thought of it fondly and with tender sentiment. His daughter was there, he said—in the little town of Agatha, Idaho, and "would you please send her a picture of me and Red." The rest of his remark was almost identical with that of Jim Roberts—"I think she would like to hear from her old dad." Needless to say, the request was gladly complied with.

Perhaps, after all, Sam hopes to find his fortune some day. Back in the minds of these men always linger the stories of such as "Lucky" Baldwin whose rare good luck and equally good nerve laid the foundation for a fortune of many millions, which have multiplied since his death to one of the greatest estates in the West.

The dramatic good fortune of L. G. Beloud, of Grass Valley, California, is another bit of western history which keeps alive the spark of hope. Beloud, it seems, had had considerable experience as a prospector and finally determined to make a careful investigation of certain regions which his government maps showed as still unclaimed. Taking his horse and buggy he and a friend set out one day for the land in question, plowing through much mud and water en route, as there had been a heavy rain but a short time before. In fact, the roads were so bad that there was some thought of giving up the journey but finally the two decided to push on and in due time reached their goal. How little they knew then all that depended on that decision.

Tying the horse to a sapling they set out on foot to explore farther. They had not gone far when they were surprised to come upon a cabin on land which the government maps showed to be unclaimed and unoccupied. Soon afterward they heard a noise in the vicinity of the tethered horse, and they rushed back in some anxiety to see if they had lost their means of conveyance. However, they found it unharmed and likewise the horse, which had been startled by some moving object. The animal had tugged at the sapling so hard that finally he uprooted it. It was still tied to the end of the hitching strap. On observing this Beloud went to the spot where the little tree had stood and was startled to find exposed in that hole in the earth a large mass of unmistakably rich gold-bearing quartz.

No words can describe the intense excitement of that moment. It meant that the dream of years had come true. At last the endless struggle, the repeated bitter disappointments which prospectors know only too well, had borne fruit. It was no mere pocket that Beloud had hit upon by the strange accident; it was a vast and rich deposit. With suppressed excitement he paced off his dimensions and erected his four monuments, after which he wrote out his claim and tacked it to a tree. He had suddenly acquired a plot of land worth more than the site of New York's Flatiron Building.

Such happenings can be duplicated scores of times. It is stories like this which make the game so fascinating. But in a few years more the old prospectors will be gone. Their ranks are receiving no new recruits, for the highly trained mining engineer is making exploration more and more systematic, and at the same time big finds on the surface are becoming more rare.

So when the motorist, on some remote highway, or the sportsman in some mountain solitude, comes upon a plodding prospector let him touch his hat to a picturesque element in our western life which is fast passing away—a fraternity which has played life's game with a free hand and a generous heart; while "jest prospectin'."

Imaginary Interviews: Calvin Coolidge

WHEN the interviewer stepped in for a chat with the shadow of Calvin Coolidge, which at the moment was sitting immobile, almost rigid, at the executive desk, memory set on either side two other Coolidges, namely, the governor of Massachusetts and the Vice-President. The three images were grouped as if in a triptych. They were absolutely alike.

Only his hairdresser could have sworn to a difference. Today Calvin Coolidge has seventeen hairs less than in 1920. But kindly nature compensated by auburning somewhat its former sandiness. It was no easy job for Mother Nature to abstract hairs from Calvin Coolidge, at that. To decrease his hirsuteness by seventeen strands it was necessary to elect him Vice-President, whereupon the seventeen hairs were lost by abrasion against the headrest of his Senate chair. And it happened when he was "not looking" because his eyes were closed.

That is the story of Calvin Coolidge's seventeen hairs.

Whenever Mr. Coolidge as Vice-President closed his eyes in the august Senate Chamber it was to think of himself as the author of the shortest speech made at any time anywhere. The interviewer has President George D. Olds, of Amherst, as authority for it. One day, in the lower house of the Massachusetts legislature, after a garrulous member haplessly paused at the beginning of a sentence which, like all his other sentences, began with "It is—" Mr. Coolidge took advantage of the pause, was recognized, and said:

"Mr. Speaker, it isn't." Whereupon Calvin Coolidge sat down.

The interviewer was ready to ask his first question but a stream of callers interrupted. Frank Stearns, Senator Borah, Nicky Longworth, Mary—either Garden or Pickford—and some others. Jingles, the cat, was not around, but that was the day the cat had run away, thus proving that there is one creature in Washington that is unimpressed by the White House. And then it is said that cats are politicians!

"I give you three guesses," said the shadow of Calvin Coolidge when the last caller had withdrawn.

"You were thinking about Northampton, and wondering whether that loose clapboard in the old double house was ever nailed down."

"No. But you are right—there was a loose board up there. However, I was thinking of Jim Lucey." Jim Lucey is the President's cobbler, but above all he is, and has been for many years, Coolidge's philosopher.

"By the way, how is your cousin, Almon W. Coolidge."

"What—have you heard about him too? Is there anything you interviewers fail to trace? First thing I know some reporter will find that I am a direct descendant of William the Conqueror."

"It's a good guess," the interviewer said to the Presidential shadow. "Let's see—Almon W. is a descendant of Obadiah Coolidge, brother of John, of whom you are a direct descendant. Anteceding them was Josiah."

"Don't forget Jonas Coolidge," grinned the shadow.

"Now the Coolidges to whom you belong advise me that they have traced their ancestry back to 1427."

"Which is before the time of Columbus," interrupted the shadow, "and Columbus very courteously and foresightedly discovered what was to be the United States for the family's especial benefit. This is a campaign year; it is just as well for somebody to seize upon some sort of a conspiracy. Columbus and Coolidge—isn't that a good one?"

"I fear not," said the interviewer. "They are after you on another score, that you abbreviate your first name to Cal as a bid for the California vote. Then, too, there is another secret. If that ever gets out—"

The shadow stiffened. "A secret?"

The interviewer lowered his voice. "Yes. You remember the box of cigarets you won at the Devon horse show two or three years ago? A whole hundred of them."

"That was the first time I ever won anything," said the shadow of President Coolidge. "It cost me a quarter to take the chance. I was afraid my quarter was gone."

"But it was not the first time that luck was with you," the interviewer said. "Down at Betterton, on upper Chesapeake Bay, they call you Fisherman Cal and the way you hauled in fish there is one of the favorite bedtime stories in the shanties."

"That wasn't so much," said the Coolidge shadow. "The fish were plentiful and hungry, that's all."

"Hungry? I should think so. Fishermen told me that it made no difference whether you baited the hook or not. When you didn't the poor fish swallowed your hook bare. Now that *is* fishing."

"There is just as much of it going on right here in this town," said the master of 1600 Pennsylvania Avenue, in a confidential whisper. "Have you counted the unbaited hooks that are dangling everywhere?"

"A few have been seen, but they won't catch anything. Politics has rusted them. What I wish to know now is what has become of the knitting bag which you once carried into the Cabinet room with you."

For Calvin Coolidge, in his Vice-Presidential days, liked to carry the bathycolpian Boston bag.

His shadow laughed. He remembered the day that he carried a bag full of mail which people insisted upon writing to him to his hotel and which he carried in bulk to his office for attention. "It is not the most aristocratic or artistic carrier," said the shadow, "but its very plainness is its best recommendation. I have always driven toward efficiency by the road of plainness."

"What to you has seemed the most amazing thing since you became President?"

"That I have not been invited to a maple sap drawing contest," was the prompt answer of Coolidge's shadow. "You heard, of course, that I could get more sap out of a maple tree than any other boy, and my father is an authority that never boasts if he can help it. But he did say that of me. Really, I am a bit disappointed that I have not been solicited to defend that title. Not that I should have gone, but it would be nice to have it remembered.

"You see," continued the Presidential shadow, reminiscing, "a tree of ordinary size will yield from fifteen to thirty gallons of sap a year, and that means from two to four pounds of sugar. But to get twenty-five or thirty gallons was a big job. I had to be on the jump to get more than the average. And the wars I had with the borers, those black and yellow longicorn beetles whose larva kills the sugar maple by boring under the bark."

"Did you ever stumble and spill the sirup?"

"I don't think so. I don't remember."

"What is your favorite sport now?"

"Indoors is to listen and think; outdoors is to look and think."

"Do you do any more window shopping?"

The shadow nodded negatively. "If a day only had 240 hours!"

"If it had," the interviewer laughed, "the Presidency would last forty years."

"Then it is better to let it remain as it is." The Coolidge jaws snapped, and though they belonged to his shadow one heard the click.

"They call you a man of mystery. Won't you say something about yourself as you consider that self?"

"Anything I said would not avail," the shadow murmured. "Come and see me again."

Reduce Divorce at the Source

Why Should Love Be Blind? Why Not Give It Sight?

By WINTHROP BLAKE

> About 150,000 divorces are granted annually in the United States.
>
> Our neighbor, Canada, has granted only 505 in the last year.
>
> In this country any circuit judge can issue a divorce. It requires only a little more effort than to get a marriage license. But in British lands each divorce means a separate Act of Parliament, which is equivalent to an Act of Congress.

CONSIDER Chicago. Since 1913 the ratio of divorces to marriages has doubled. In 1922 there was one divorce to each 5.2 marriages; but in 1923 the latter slumped to 4.7.

Consider Indiana. It is a typical state in many ways, but not matrimonially. It has a record of 5.4 marriages to each divorce whereas the national rate is 7.6 marriages to each dissolution of "the tie that binds."

"Divorce," declared Gladstone, the eminent Englishman, "perhaps constitutes the greatest menace to American institutions."

A certain patient statistician averred not long ago that if the present rate of increase is not checked, the number of divorces will *equal* the number of marriages within ten years. I think he overstated the danger; perhaps twenty-five years would be a better guess as the time when this equality may be reached.

Some of the reasons for the present divorce epidemic in the "Windy City" have been given by the judges there. Concisely, they are: too much jazz and liquor; ultra-sophistication of the modern generation; poor cooking and makeshift delicatessen dinners; failure of the contracting parties to regard solemnly the bonds of matrimony; tendency of young married couples to live with the husband's or wife's parents and thus become readily susceptible to the in-law influence.

"They," asserts one of Chicago's judges, "get a civil marriage now at the courthouse with as little ceremony as taking out a dog license. What is needed is more religion in the home."

His theory is that of "too much haste makes waste." A quick tying may result in a speedy untying. Though he says "more religion," I am sure he would have all couples proceed cautiously.

Most of the Chicago judges agree that economic marriages are successful. They affirm that working husbands and wives rarely seek dissolution of "the tie that binds."

A prolific source of divorce, not named by the Chicago judges, however, is the union of children.

In 1920 there were 1,600 boys and 12,000 girls, fifteen years of age, listed as wedded here in our civilized country. The married boys of sixteen numbered 3,222, those of seventeen, 7,690 and those of eighteen, 24,644. The girls married at sixteen numbered 41,620, at seventeen, 90,930 and those at eighteen were 186,645, a veritable host. Some of the states actually permit the marriage of girls only twelve years old.

Soon after the ceremony many of these children find that they have made a truly tragic mistake; they quarrel, separate and obtain a divorce, often with a suicide or homicide accompaniment. Child marriage is usually a necessity, an aftermath of the parents' failure in training or supervision or in both. It is plain that parents and teachers should discipline children to avoid emotional excesses.

There are two principal reasons that may account for the truly alarming divorce epidemic. Reason 1: "Love is blind" and getting blinder still every year. Reason 2: We are immoral, and rapidly growing more so. We cannot place the responsibility for this deplorable situation upon the war; we have made the war a catch-all for most of our present ills; this situation existed, as the Gladstone comment points out, before the twentieth century had even dawned. So the war must be absolved from major blame, though it did cause a further lowering of morals.

"Love is blind," runs the ancient maxim. I do not believe it. The cases to which we apply this saying as an alibi or explanation are usually examples of *infatuation,* and infatuation is invariably unseeing. Why? Well, it is passion; and passion makes the subject almost unable to sleep or reason.

The worst causative of divorce, I maintain, is infatuation. Reduce divorce at the source by lessening the possibility of the prenuptial infatuation; for back of most separations lies the passion that has cooled. I think it may be said with a great deal of veracity that true love does not cool, or, if it does, not with the marked suddenness and inevitability that characterizes this illusory, corporeal, common love.

Of every ten couples that wed, only one is able to furnish their home without having debt as a menace to their romance. Another of the ten couples will rent furnished rooms. Eight out of every ten couples, beginning their enlarged living, will furnish their homes wholly or partly on credit; this means the partial payment plan, so much down and so much each month, almost without limit.

An expert in economics has investigated this problem in an effort to determine how extensive the financial foundation of matrimony must be to keep it away from divorce courts. He says that forty per cent of the yearly salary of a young married man is necessary to furnish a home comfortably in the average American city. For a man earning $150 a month, $720 would be the required financial nest egg; if he were a $200 man, he would need close to a thousand dollars, $960, to be exact. The expert points out that two peak loads come to married life, that of furnishing the home at the start, and then, approximately twenty years later, when the children have their hearts set on a college education.

I said that infatuation is a serious factor. Money is also a serious factor that should not be disregarded. The question of money should be discussed most thoroughly before marriage; it certainly will be afterward. The bride should know before the ceremony whether she will be put to the necessity of raiding her husband's pockets or of cringing at his feet whenever she wants a little sum for groceries or a new pair of stockings. If scrimping and saving must be done, she should be fully aware of this fact. It does seem that husbands and wives should be business, home and love partners; if they are, the bogey of divorce will be too ashamed to show itself.

Frankness is a fine recipe. We preach it, but we do not practice it. Instead, there is much deception by both parties during the courtship. For many brides and for many grooms "the day after" is the day of disillusionment.

Last-chance marriages and those of youth with age are heavily handicapped from the beginning; divorce is the probable sequel. I have before me the story of a woman, eighty-seven, suing for separation from a man of forty-seven. She charges cruelty and that he married her for her money. After failing to force her into an asylum, he mistreated her. The judge took the case under advisement, but he lectured the woman severely because she was old enough to forget matrimony.

Biologically, a woman ages much faster than a man. For this reason the man should be older in years at the start of the conjugal life. If the bride is five years older than the groom, she will be comparatively ten years older when she reaches the middle-age period. The way to reduce divorce from the age discrepancy is to have the discrepancy, or margin of years, masculine instead of feminine.

Mr. Sapiro Tells His Story on the Witness Stand

Concluded from page 6

tries and that within three years from that date there will be a pool at Liverpool selling the wheat of Canada, the United States, Australia, New Zealand, and the Argentine." A. And that is within the region of possibility.

Q. Then you went on to say this a little later on: "I tell you that the thing is as good as done, and that the growers of the world will name the price of the wheat instead of it being named by the gamblers of the world. (Loud cheers and applause.)" A. I think that is true.

Q. This is the international pool or world pool you have in mind? A. Yes—which I consider inevitable over a term of years.

Q. Then you would have some other countries you have not mentioned there? A. Yes, there are some.

Q. India? A. *Russia, Roumania, Serbia.*

Q. All these wheat-producing countries?

A. Yes.

Q. Of course would be, while these other pools were forming, competing? A. Necessarily. You may not know it, *but one of the best-organized countries in the whole world on co-operative marketing is Russia.*

By Mr. Pitblado:

Q. At any rate you did not mention those countries.

A. Because I was afraid it might not be popular with you people to speak of Russia, but now, since England has recognized Russia and since commercial relations can be made, it is fairly likely that something can be done with reference to Russian surplus wheat.

Q. Well, we have got that idea. Now, coming back, you have seen this world's pool idea discussed at different times? A. Yes.

Q. (Reading from Professor Taylor, of Stanford University.) "It has been suggested that when the wheat growers of the United States form a pool, this action will be confirmed by the formation of smaller associations in Canada, Argentina, and Australia, the joint efforts of which would effectively raise world wheat prices. Such a suggestion is sheer fantasy. If Europe were economically strong enough to pay hold-up prices for wheat, she would be politically strong enough to repel the hold-up; if she were too weak politically to repel the hold-up, she would be economically too weak to pay hold-up prices."

A. All of which is a tragic sort of article. I think it was more than contemptible for any writer to start in to write the word "hold-up," as applied to the efforts of a group of growers, either in this country or any other country, in their attempt to try to get a fair price for their product. I want to get that in the record, since you have got Dr. Taylor's abusive words.

Q. You have used some abusive words, yourself?

A. Oh, yes. I am fairly good at that. We fellows that get abuse have got to learn to give back some of it.

Q. How are you going to prevent increased production in Canada, or in the other wheat producing countries? A. The question is this: if we can make wheat through this organization worth, say, $1.30 a bushel to the farmer, instead of eighty cents, will that not increase production and hurt him in the end?

Q. I did not put it that way, I am putting my question this way. I say, how are you going to prevent increased production? A. All right. In the first place, you have had perfectly enormous increased production without a spur of such unusually good prices. In the second place, I am dealing with a state of facts as they are. The farmer is not making any money; he is having his hardships and is trying to create a system under which he may make something. If by making money he still undergoes other hazards, I would rather have him face the hazards of prosperity than the hazards of poverty. If he has a little money to fight with, he may be able to achieve something. Now, as to the increased production: in the first place, it is possible that increased production would follow a very much higher price level on wheat. It did that in the United States. It is also possible that the consumption of wheat can be increased and can be increased materially. At a conference held in Chicago it was assumed that under proper advertisement and proper conditions they ought to be able to increase the use of wheat products in the United States by 200 million bushels a year. If they would raise their per capita consumption of wheat flour in the United States to the per capita consumption of wheat flour in France, they would increase it by more than 200 million bushels a year. So it is possible that if you did get this increased production, you could get likewise increased consumption. Secondly—

Q. Now, just one minute. A. No, I am going to give you a thorough answer to this. Pardon me, Mr. Chairman.

The Chairman: We, ourselves, are anxious to be informed of certain things and we would like you to continue.

Witness: Secondly, if you do get this increased production, there is nothing in the so-called idea of a crop pool which would prevent carry-over, and wheat can be carried over from season to season and meet the times when you do not get completely normal production. Thus far, every bushel of wheat in the world has been eaten at some time. Now, if over-production followed over-production, then the method of handling would be as follows: to form within your association two separate contracts; to take the normal acreage of each man and say this is your normal production of wheat, or your normal acreage. That will be put in the primary pool. Any wheat which you deliver above that, and you may deliver just as much as you wish, will be put in a secondary pool. Then, in that way, you will sell your primary pool first at whatever the market should warrant. Your second pool you would simply have to dump or carry from time to time, and give them long value, instead of selling value. That, automatically, would discourage over-planting.

By Commissioner MacGibbon:

Q. How would you prevent the grain tied up with the secondary pool from influencing the price? A. By simply not letting it out. If the world can only consume a certain amount of wheat, you cannot make them consume more by putting it on the market. If there is a limit of three billion bushels, or whatever the point might be, they won't eat three billion eight hundred million bushels, except by advertising or otherwise you induce them to do it.

Q. That is the answer, and you make a speech of it. A. Well, that is my privilege.

Q. You think that is quite legitimate, of course?

A. Absolutely legitimate. I want to say here, since you have asked if that was legitimate, I want to say it is fully as legitimate as to subject a witness to cross-examination where the witness was never even given a chance to put in a primary case. I did not object when I was subjected to it this morning, and I don't want to object now, but I don't want counsel to suggest that I am doing illegitimate things, because I anticipate propaganda purposes in his questions.

The Chairman: Mr. Sapiro, you have come a long way to be here and, what is more, you are not a British subject and you are not subject to our jurisdiction, and we feel grateful to you for being here. When we were first asked to bring you here, we said Mr. Sapiro happens to be in Manitoba, a stranger traveling among us, we will not abuse our jurisdiction by subpoenaing him. We will let him come, if he wants to come, but if he wants to come, he must come like any other witness and submit to being examined and cross-examined . . . . We are not here, however, as a mere vehicle for getting things into the newspapers. The newspapers are quite entitled to take a fair report of whatever evidence is given. We are here as a body appointed by the federal government and by the various provincial governments in order to investigate certain matters, one of which is the marketing of wheat and the different systems whereby wheat is or may be marketed. We are here for our own information. We have to write a report, a serious report to the federal government and the provincial governments on matters concerning which you are giving evidence today. Now, this is mainly the newspapers that are being spoken to. We want information for ourselves, for the purpose of our study. This has, no doubt, been of interest to the newspapers. Well and good, let them take it, so long as they make fair reports. So far, I think you have been granted every opportunity. It is quite true that, not having been examined by your counsel over the subject of marketing, the cross-examination must come more or less as a surprise.

Witness: I don't object.

The Chairman: As long as you don't object, that difficulty is removed. Now, on the other hand, Mr. Sapiro, every time you are confronted with a difficulty, and every scheme that anybody has ever propounded yet contains a difficulty, you must not flare up and take the attitude that those who propose the difficulty are necessarily hostile to your case. For instance, Mr. Woods, who has no interest in the Grain Exchange or any other corporation, asked you a few questions and you immediately said you were surprised to see counsel for this commission arguing against farmers.

Witness: If Mr. Woods is not antagonistic, I would withdraw the remark. I don't want to be unjust.

The Chairman: Is there anyone else who desires to question Mr. Sapiro? If not then we are very much obliged to you Mr. Sapiro and we have derived a great deal of benefit from your presence here today and you are now at liberty.

Baseball—How It Works in Theory and Practice

Individual Intelligence of Greatest Value in National Sport

By PAUL MACDONALD

THE value of strategy in baseball is problematical. Individual strategy is invariably a keen asset, team strategy lacks this percentage.

Baseball is a game of the individual; football a game of a group of individuals with the success of each depending upon the perfect co-operation of the other individuals.

The ideas of team play in baseball have, in many instances, found their incentive in football.

Team play cannot be applied to baseball as it can to football because in baseball we have units working as units and in football units working as a whole.

Ball games are won by bats and arms and individual intelligence. Team work is secondary to individual effort.

Strategy often fails in baseball because the situation for which the strategy is planned changes in the flick of an eyelash.

One player may "outsmart" another or one may "outsmart" a group in baseball but one group rarely "outsmarts" another group because the strategy planned for various situations is spoiled by the change in the situation and is therefore only a hindrance, resulting in confusion.

Individual intelligence in baseball is probably the most desired quality. If the majority of players on a team are intelligent that team will provide strategy without having set plays.

Team strategy in baseball is like an overabundance of signals. It is more likely than not to rattle even the intelligent player in close situations.

* * *

The leading intellects of baseball do not make the best managers, always. There is this about a great star—he performed certain feats and he expects his players to perform the same feats. He does not seem able to realize that he would never have achieved his place in baseball if he had not been able to do things that other players could not do. Having been a leading star is frequently a serious handicap to a manager. If all players were capable of doing the things that other players do there would be no stars.

* * *

Styles change in baseball. But they also change in swimming, football, basketball, polo, tennis and other sports. The system of play changes in all sports as the plan of living, the plan of architectural construction, plumbing, shipbuilding, automobile manufacturing, glass making, literature, painting, music, dancing, lace making, cooking spaghetti and preparing chicken salad. All things change as generation follows generation. Do not become annoyed at the gentlemen who sit at your side and sigh for the good old days, the days of Delahanty and Rusie, Anson and Radbourne, for you some day will be sitting in probably the same spot sighing for the good old days of Mathewson and Brown, Wagner and Lajoie, Speaker and Collins, Cobb and Ruth. And the generation that hears your sighs will be annoyed as you are today and will continue watching ball games with the same interest that you show today.

* * *

A curve ball is originally a fast ball or a slow ball. It remains a fast ball or a slow ball until within two feet of the plate, or nearer. Then it begins breaking. All deliveries are the same nearly the entire route from pitchers box to the plate.

* * *

If you fool a batsman on a certain kind of delivery you will weaken him on all deliveries. If a batter has a distinct weakness and you discover that weakness and begin pitching to it, the batter begins looking for that delivery. His mind will be set on facing it and he is thrown off his batting stride for anything else you may serve him. He is constantly looking for the ball that he is least able to hit. We have seen reputed fast ball pitchers shut out a team by pitching nothing but slow balls for every batter spent his entire time at the plate looking for the fast one. We once saw Ed. Walsh strike out Ty Cobb four times in one game using nothing but fast balls but faking the spit ball each time. Cobb kept looking for the spit ball.

* * *

The average pitcher and catcher, whether in the major leagues or the minors, pitches and catches on a certain set plan. The intelligent batsman by making careful mental note of what is being served him can come near guessing sooner or later just what the pitcher intends to deliver and set himself accordingly. If the system works on the batsman the first time, or the first and second time, it is almost certain to be repeated. The pitching repertoire is followed in strict order.

* * *

Simplified batting practice in the major leagues is of doubted value. During the time allotted for this exercise the pitcher informs the batsman what he is about to throw, fast fall, curve or slow ball. The batsman gets set accordingly. Then, when the game starts, the opposing pitcher will refuse to tell the batter what he intends to serve him and, more than that, will probably pitch in an entirely different style, adding to the general confusion of the batter. It seems to us that he would be better equipped to face the opposing pitcher if he had been forced to guess the delivery of his own pitching team-mate during practice.

* * *

A team of young players often shows the dash and fire of youth and the ambition that is found in youth. It is a hustling team and soars high while things break smoothly, for youth on an even course goes dashing forward. But when reverses set in there is a collapse in morale for youth becomes panicky in the face of adversity where the mature player, with the benefit of experience, views the catastrophe of the moment philosophically. A veteran masters these breaks while a youngster is mastered by them. The point is illustrated by the Philadelphia Athletics of 1923.

* * *

Personal initiative counts in baseball more than in the majority of human endeavors. Baseball being more a game of individual units than most games offers success to the individual with initiative. No player ever became a star without it.

* * *

It is bad policy to put a player under orders at bat when those orders refer to a certain pitched ball. A manager often tells the batsman to hit the first good one that comes over the plate. The batsman is handicapped by the order. He is afraid to let a good one get by and he frequently discovers too late that the ball is a good one. When this discovery comes late he will be off stride and only extreme luck can enable him to hit the ball fairly and safely. The first good one pitched to a batsman is more likely than not the kind of ball he is least likely to hit, particularly if he is batting against a capable pitcher. The batsman knows better than anyone else how the pitcher is pitching to him and is therefore better able to decide on the time to offer at a pitched ball. The pinch batsman told to hit the first good one that comes over rarely fills the order, for not having looked at a pitched ball all day his eye is unaccustomed to the ball and he is severely handicapped.

* * *

Applying the term "yellow" to a player is rarely anything but unjust. Few players lack courage. Often the player who makes a mistake in a crisis is a player of extremely nervous temperament. He lacks neither physical nor moral courage. Some of the gamest men in baseball have been accused of lacking heart and their mistakes have frequently been caused by their over-anxiety to establish their courage. The most valuable players frequently make mistakes in a crisis. They have nerve but also nerves and the nerves crash at times. A player with nerve but no nerves while never breaking in any situation is never the man who contributes the scintillating plays to the baseball drama. The players that perform the brilliant feats are invariably the players with nerves.

* * *

Catchers are often discredited because base runners steal. When the men on the bases run wild the catcher is certain to draw the blame. But, did it ever occur to you why those same base runners attempt to run wild only on certain days against the same catcher? If you have noticed this reflect upon the matter before blaming the catcher. Base runners judge their chances of advancing by the motion of the pitcher. Some pitchers with a slow or extra long windup are an open invitation to the base runner to attempt to advance. Whenever you see base runners going down inning after inning, watch the pitcher. Even some veteran pitchers have still to learn the trick of keeping runners hugging the bases. Some pitchers pay little attention to the base runner and concentrate their attention on the batsman and they use the same long or slow windup with men on bases that they use when bases are empty. That the pitcher is mainly to blame for stolen bases has been acknowledged by the chiefs of baseball and in the official scores the stolen bases are charged to the pitchers.

* * *

It is not always bad fielding that causes an infielder to look bad at times when taking a throw from the catcher. Some catchers throw a light ball while others throw an extremely heavy ball. It all depends on the manner in which the catcher releases the ball. Balls thrown by certain catchers crash into an infielder's glove like a sixteen-pound shot while balls thrown by other catchers come to the fielders as light as tennis balls in comparison.

* * *

Theory in baseball is worth only as much as the physical ability of the men entrusted with the theory to practice it. A manager may have a theory on a certain play but if the players on whom he depends to execute the theory are not all physically capable of carrying it out the theory fails absolutely. If three players are required to carry out a theory and one lacks the physical ability that the execution demands then the theory is worthless. Ofttimes managers either overestimate the physical ability of their players or underestimate the physical demands of the theory.

* * *

Great ball clubs win close games. Teams that cannot win the close ones cannot win pennants. To lose close games has its psychological effect. Players, by losing, become impressed with the lack of punch and the confidence is lacking in games that follow. By losing close ones they will lose games that are not close because of lack of confidence. Find a team that is on top in close games, rather in the majority of them, and you have a team that will be on top or close to the league leadership.

* * *

Teams that win pennants are generally teams that can beat the pick of the league. If they can beat good teams they can beat weak ones. But there are always six other teams to beat a weak one if a good team cannot and by beating the other good teams one team can gain leadership. A team can climb into second place by beating six other clubs but if it cannot defeat the team in the lead it cannot hope to win the pennant for the league leader will manage to keep it out of first place.

* * *

No player is without weakness but what separates the rank from the file in baseball is that some players have less weaknesses than others. The reason there are not more stars in baseball is that players of the file either try to forget their weaknesses or try to hide them. The minority in the rank recognized their weaknesses and instead of trying to hide them and gloss them over set about to eradicate them. The way to get rid of a weed is to pull it out by the roots; by simply cutting it you remove it from sight for the time being but it is bound to crop out again. So with playing faults.

* * *

Inferior ball clubs are always the hardest teams to beat. A good team opposing a weak team under-estimates it, becomes careless and does not play the tight baseball that it produces when opposing a team of recognized strength and ability. The weak team with nothing to lose and much to gain has a mental freedom that the leading teams lack and is likely, because of the absence of mental hazards, to do a great deal better.

* * *

Ball games are not won on batting averages. How many times have you seen a player with a dazzling batting average passed in a pinch to bring up a player whose batting average is not half so high as the man intentionally walked and deliver the hit that in all probability the man with the dazzling average would not have produced in this situation? A batsman whose average is .037 is of immensely greater value in a pinch if he gets a single with second and third occupied than the man whose average is .398 and who fails to hit in this situation. Any manager would much prefer a .197 batter to a .397 batter if the player batting .197 could produce his hits when needed, few hits that he gets. We have seen teams lead major leagues in batting and finish no better than fifth for while they had the batting strength they could not win half their ball games. Too much stress has been put upon batting averages; their value has been too highly estimated.

* * *

Players often are misjudged by what they do in one series. Every player finds his off week, when everything seems to break wrong for him. He is in a batting slump, his fielding is bad and he is generally out of luck. Often a lasting opinion of the player is formed on that series. Again, a player may play "a mile above his stride" in one series and he is hailed as a marvel. It may be the only series in which he does fine work through an entire season. We remember last year that a mediocre shortstop performed brilliantly through one series in the East and the newspapers of that city acclaimed him the greatest shortstop in the leagues. He was—in that series. It is what a player averages the year around that places him in the ranking.

* * *

One delivery can beat a ball club. The same delivery may not beat another club. Certain pitchers have been kept solely because of their ability to beat a certain club. That club was helpless against the certain delivery the pitcher used but this same delivery was easy for six other teams in the league. Just as individual players always find it difficult to hit certain pitchers while other pitchers, of much higher standing, prove comparatively easy for them.

* * *

Grover Cleveland Alexander last year proved that control is not a lost trick. Alexander, thirty-seven years old and pitching for the Chicago Nationals, his thirteenth season in the major leagues, walked twenty-six batters in 305 innings, an unusual record. In twenty-one of his games last year Alexander did not walk a batsman.

Alexander is one of the outstanding pitchers of baseball. He has depended upon a fast ball, a curve, control and knowledge of the weaknesses of batters. Years ago this same Alexander was cast adrift by the Indianapolis club of the American Association because "he has no control and will never develop it."

BRIEFLY TOLD

Elephants play football in the jungles of Africa, forming the ball out of earth taken from an anthill.

The tenth anniversary of the opening of the Panama Canal to commerce will occur on August 15. The net operating profit of the Panama Canal last year was $13,299,292. The tonnage passing through this canal is greater than that passing through the Suez Canal.

A twenty-one-year-old inmate of the Nazareth Institute for the Blind, in Montreal, is the recipient of a traveling scholarship from the Province of Quebec, won in a musical contest, which will enable him to continue his musical studies in Europe. The cash value of the scholarship is $3,000.

A Boer farmer in 1863 took a number of young wild ostrich chickens, tamed them and to the surprise of many successfully reared them as he would have reared cattle. Others followed his example and they are now reared in inclosures, a couple of acres to a bird, and fed like fine stock on alfalfa or lucerne, a rich clover, easily cultivated.

Mrs. Soledad C. Chacon, secretary of state of the state of New Mexico, acted as governor of that state during the Democratic Convention when Governor Hinkle was in New York City. This is believed to be the first instance where a woman has acted as chief executive of a state in the United States. Mrs. Chacon is a direct descendant of the early Spanish Conquistadores.

On June 18 Winnipeg celebrated the fiftieth anniversary of its incorporation. From a small, struggling frontier town of the seventies, Winnipeg has forged ahead, and it is now the third largest city in the Dominion.

Nearly six billions of dollars are reported as invested in electric railways. This approximates one-third of the Interstate Commerce Commission's valuation of the steam roads and is two per cent of the national wealth of the United States.

Fifty-one per cent of all main railroad track (whether single or double) in the United States is not equipped with block signals of any kind.

William W. Delaney, for thirty-four years a writer and collector of "popular American songs," the sentimental ballads of home and mother, the lyrical narratives of outcasts, is going out of business. The old Park Row shop, lighted by a single gas jet, will be closed. Harvard College and the Grosvenor Library of Buffalo are buying his last stock of sheet music, about fifteen hundred songs.

One hundred thousand aliens in excess of the quotas allowed by law were smuggled into the United States last year.

There is 800,000 horse power available in the water resources of Esthonia.

Eight thousand pounds of earth containing specimens of the larvae or grubs of *Prosena,* a dexiid fly which in this stage feeds on the larvae of the destructive Japanese beetle, has been received in this country from Japan. They will be distributed about Philadelphia and Camden, the districts of greatest infestation.

Flowers picked in the morning in Holland are on sale in Berlin soon after noon every day, the blossoms being brought there by airplane.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Within a few hours of the time the big dam on the headwaters of the Yukon River went into operation the waters rose more than a foot. The dam will conserve flood waters and assist lake and river navigation when water is low.

Because of the lack of accommodation during the social season in London, a party of Gothenburg students have chartered a ship in which they will live while visiting England. The vessel is to lie off Greenwich in the Thames.

The Chinese business man operating a small shop is the best shopkeeper in the world. But in large enterprises, which require more than personal or family attention, difficulties rapidly develop.

Of the three great modern beverages—chocolate, coffee and tea—chocolate was the first to reach western countries. Tea followed in 1588, and coffee in the following century. Cortez found cocoa in Mexico in 1519, where its use by the natives dated from time immemorial. The people of Abyssinia have used coffee from the remotest times and, according to Chinese traditions, tea was drunk in that country three thousand years B. C.

The last survivors of the white rhinoceros are being wantonly killed off by man. Only a hundred or so still survive in French, Belgian and British Congo.

A Greenwood, Indiana, woman, Mrs. Grace Porterfield Polk, is organizing grandmothers into clubs. The membership is confined to grandmothers of at least seventy years of age.

The Arabian "khabis" consists of fine selected dates coated with a mixture of honey and butter. It is one of the oldest dishes of which any record can be found and is a favorite confection among the Orientals to whom the date is a staple food.

A factory has been established at Johannesburg, South Africa, to use locusts in the manufacture of concentrated cattle and poultry feeds. The raw material is almost inexhaustible and a large output is anticipated.

The pioneer fathers were the first manufacturers in America. They made leather, sugar, malt, potash and soap. They were the first to press oil from seeds, the first to use dye for coloring their homespun, and the first to use the process of salting, smoking and drying for preserving food. Our present industries have grown out of the pioneer methods.

In Java begonias grow like weeds beside every mountain stream.

Fercalbo, a new road material used in South Africa, consists of iron stone conglomerate, impure limestone, consisting of a mixture of calcium carbonate and silicon dioxide, or in ordinary parlance, sand, and a small part of dark-colored carbonaceous gravel. When further mixed with broken metal and laid on a road it will last indefinitely.

Among sailors there is an old superstition against changing the name of a ship—because it is believed to bring the vessel bad luck.

An eight-cent air mail stamp will carry an ounce letter anywhere within the three zones provided for by the United States air service. These zones are between New York and Chicago; Chicago and Cheyenne and between Cheyenne and San Francisco. Air mail postage will be honored for travel by train off the beaten air path.

The Canadian Government has passed a law prohibiting all trapping south of the Canadian Pacific main line, except such predatory animals as wolves and skunks which cause havoc among farm stock.

"A people too self-indulgent for political earnestness may relapse into a shallow acceptance of politics as the fated domain of sordid and hypocritical craft. From this temper all possibility of significant choices is fled."—*William Ernest Hocking,* in the *Yale Review.*

"Talent is that which is in a man's power; genius is that in whose power a man is."—*Lowell.*

The Austrian Government has decided to abolish passport visas and substitute for them stamps which can be bought at tourist agencies, according to reports.

"Remember especially that sarcasm or biting witticism at the expense of a subordinate, especially if he is an enlisted man and thus incapable of retaliation, is unmanly and fatal to one's standing as an officer . . . . It is a safe rule in dealing with a man under you to put yourself, by imagination, in his place."—*Curtis D. Wilbur,* Secretary of the Navy, to the graduates at the Annapolis Naval Academy.

Lhassa, the Forbidden City, has succumbed to the inevitable. Commodities are to be displaced as mediums of exchange in Tibet and power-driven machinery set up in Lhassa itself will include equipment for minting coins to be used as money.

John C. Coolidge, the President's father, refused an invitation to the Republican Convention in Cleveland because his potatoes were not in. His oats and wheat and grass seed were planted and he was harrowing when interviewed.

Shanghai has a symphony orchestra of about fifty pieces, playing on Sunday afternoons during the summer at Jessfield Park and Hongkew Park. It is purely a "volunteer" organization made up of various nationalities. Its programs are excellent and its recitals are well attended.

The oldest bottle of wine in the world, so far as is now known, is in the possession of a London wine expert. It is a bottle of Bavarian hock, which bears on its label the date 1540.

Should U. S. Have Department of Education?

Can You Think Correctly on This Question Unless You Have these Facts?

By AARON HARDY ULM

A MAN of affairs called at the Bureau of Education in Washington recently and, as if asking for a pamphlet, said:

"I want to get the names and addresses of all the school children in the United States."

The official addressed steadied himself and inquired: "What do you want with them?"

"An organization with which I am connected wishes to mail a booklet to each child in the country attending school."

"A rather big undertaking," the official replied.

"We are ready to go through with it," the visitor retorted confidently, "even though it costs several thousand dollars."

"You had better be prepared to spend a million or more," said the official as he scribbled a few figures on a scratch pad. "At a penny apiece the postage alone will cost you more than two hundred and fifty thousand dollars. There are now enrolled in the public schools of all the country nearly twenty-four million persons, with more than two or three million in private schools."

The caller didn't wait to learn that the bureau possessed no such list as he had thought he wanted.

He, like many others, had little notion of the immensity of school life in this country.

Our school population alone, pupils actually enrolled in elementary and secondary schools, is greater than the aggregate population of Denmark, Sweden, Norway, the Netherlands and Switzerland, with the peoples of which countries we are so often compared—unfavorably to ourselves—as to literacy.

Aside from numbers, the business of educating these millions of school children involves more complexities than adhere to a like undertaking in any other country. They are scattered over a larger and more diverse area than are the children of any other country, except China and Russia. The educational system of no other country is confused by anything like the difficulties set up in ours by large immigrant and Negro populations.

The schools of no other country evolved from such a variety of beginnings. Those of most other countries were created and developed by central governments; ours grew from small-community beginnings. The schools of no other country are so enwrapped with local tradition, local viewpoint, local need, even local pride.

The common schools of this country, as shall be shown later, are still predominantly community institutions, locally supported, administered and conducted.

They comprise an incomparably bigger and more complex and delicate institution than when the Federal Government was set up to look after the national affairs of three million homogeneous people in only thirteen states.

Yet the school then was considered too intimate and delicate a matter to be intrusted in any way to the Federal Government. This statement is based on inference, for there is almost no record except the fact that the Constitution of the United States makes no reference to schools or education. James Madison proposed in the convention which framed it that the general government be authorized to "establish seminaries of learning for the promotion of literature and the arts and sciences." Apparently the proposal was not discussed nor voted on. It is doubtful if any group of men, as individuals, ever had greater fervor for education than did that which wrote the Constitution. The inference, therefore, is that they were all but unanimous in the belief that it would not be safe for the Federal Government to have any power whatever over either the schools or the churches; for God, too, was omitted from the Constitution.

The omission of schools from the Constitution was emphasized by the Tenth Amendment, reserving to the states and the people all powers not positively granted the Federal Government. *Thus all authorities hold that the Federal Government has no constitutional right to exercise any power whatever over education in the states.*

Although the Federal Government was denied all authority in the premises, the growth of schools and the spread of education in this country is among the marvelous developments of the age.

Is It True That We Are So Illiterate?

THIS development has been most rapid during the last seventy-five years. In 1870 all the country was spending less than $70,000,000 a year on common schools. In 1922 a total of $1,580,000,000 of public funds was spent on the schools. The figure does not include the cost of large debts incurred on account of the schools.

Expenditures on schools *increased two and a half times* between 1915 and 1922. They increased more than thirty per cent during the two years preceding the last for which figures are available. During these same two years enrollments of pupils increased by nearly two millions. Within less than a quarter of a century annual enrollments have grown from about one-third to more than two-thirds of the total population of school age.

There has been like growth in the value of school property, in the length of school terms and average attendance, in the employment of trained teachers; in fact, in everything having to do with the schools.

This development is reflected in census figures on illiteracy. In 1870 twenty of every hundred Americans more than ten years old could not write. In 1920 only six in each hundred were illiterate. This is a drop from twenty to six per cent in less than one lifetime.

Current figures for illiteracy seem large;—*IF* you gulp them down without examination, as many propagandists would have you do. *Illiteracy figures of today are not figures of today's illiteracy.* They reflect schools of twenty, fifty, even seventy years ago. The illiteracy allowed to accumulate then cannot be corrected now. The bulk of our illiterates are persons beyond school age. It is not the schools of the present but the schools of the past that are to be charged with them. *Of the persons who certainly should be in school now, that is, those ten to sixteen years of age, only 2.3 per cent are illiterate.* These include the Negroes and the foreign-born.

For native whites of school age—that is, those who will run the country a generation hence—*we probably have the best literacy record on earth.* In 1920 only a little more than one per cent of those ten to sixteen years old were illiterate. Of native children, ten to sixteen years old, of foreign or mixed parentage there was *practically no illiteracy in 1920.*

Our record of literacy for those of the population that the common schools still may reach is not quite so good *statistically* as that of a few other countries. *But our statistics are probably more accurate than those of others, which in the main estimate illiteracy from such data as applications for marriage licenses and examinations of army recruits, while ours is based on house-to-house canvasses.*

The figures of the last census, together with educational progress now being made, show clearly that mere illiteracy among native-born whites of school age is no longer a gigantic problem. Since there are compulsory education laws now in all states, the next census undoubtedly will show a reduction to *nil.*

This progress is due principally to the initiative and enterprise of *local communities working independently* and in great part unassisted. *While every state government has a school department, there is not a single state-managed or state-supported school system in the country. The majority of the schools are and always have been in administrative units of less than even county size.*

But, as shall be shown in a later article, the states have helped—and in some cases hurt by helping too much or in the wrong way.

The Federal Government, too, has helped in spite of the fact that the Constitution does not mention the subject.

The U. S. Has Always Befriended Schools

GENERAL government aid to education antedates the Constitution. For it was in 1785 that the Continental Congress made the first general government move on behalf of education. That move was probably the most statesmanlike ever put forth anywhere on behalf of free schools. It was put forth in the form of an ordinance reserving portions of the government's public lands for schools in new communities and new states. At first one land lot in each township was so reserved from sale. Later two land lots were reserved as community school endowments. Later, millions of acres of salt and swamp lands were added.

These were not "gifts" any more than streets laid down in a new suburban division by real estate promoters are gifts to the residents who later use them. In fact, the land-lot reservations were made in great part for the purpose of rendering adjoining lands more salable. There were other like reservations for religion and specifically for churches. Hence these reservations, if used as precedents, will have to be regarded as just as sound precedents for Federal appropriations to churches as to schools.

If these school reservations had been treated as endowments, as it was intended that they should be, they would constitute today the greatest endowment to education that the world has known.

Lands reserved for elementary schools aggregated more than 150,000,000 acres, now worth billions of dollars. Some of the states also reserved millions of acres of their own lands for the same purpose.

While these reservations did much for schools, the lands in the main were sold for pittances and the funds thus derived were in great part wasted. Some of the states still have "permanent school funds" thus derived, but most of these endowments are statistical fictions only.

The Federal Government attached no "strings" to the lands it reserved for free schools. In one case an accounting to Washington was provided for, but this was quickly abandoned.

No "strings" were tied to many million acres of land reserved for higher education in the states. The Morrill Act of 1862, giving lands and now a specific appropriation to the land-grant colleges, has required from the beginning an accounting but nothing more. Federal-aid acts of recent years have gone further; they retain in Washington the right to pass on plans for the spending of the funds provided and to withhold funds when the plans don't suit those in power there, as sometimes has been done.

The Federal Government has provided other "aids" for education in the states, such as the per centum grants of funds derived from sales of public lands and revenues from Federal-owned forest and mineral lands in the states. It once also distributed $37,000,000 of unneeded Treasury funds among the states, many of which dedicated their shares to education. Then there are recently provided "aids," such as those administered by the Federal Board for Vocational Education.

Direct and indirect "aids" to schools in the states do not comprise all that the Federal Government has done for education. Numerous and varied other educational enterprises have been carried on independently of the states. Among these are the Indian schools, the schools for natives in Alaska, the public schools of the District of Columbia, Howard University for Negroes, the army, navy and coast guard academies, together with only general educational institutions, like the Smithsonian, the Library of Congress and several research bureaus. The most pertinent of the last is the Bureau of Education, whose relation to the schools of the states has been confined wholly to collecting and distributing information, a work that has been of much value.

All told, the Federal Government's educational enterprises number not less than twenty-five. They are operated by four departments and several independent bureaus.

It has long been urged that they be co-ordinated into a single whole. The most thorough study made of this was by the Congressional Committee on Reorganization of the Government which recently reported.

This committee recommended that there be created a Department of Education and Welfare. But it could find reason for recommending only five of the units through which the government now engages in educational activity for inclusion in this department. These are the Bureau of Education, Howard University, the Federal Board for Vocational Education, the District of Columbia school for the deaf, and the educational as well as all other work of the Veterans' Bureau.

The only other outstanding proposal in this direction is the one contained in the Sterling-Reed or National Education Bill, for which there has been much agitation.

As far as co-ordinating present educational activities, this bill would do—nothing. It provides merely for the expansion of the Bureau of Education into a department. The inclusion of other present activities would be left to the future "as Congress may determine." The only other present activity which the bill's proponents specifically suggest for inclusion is the Vocational Board.

Objections Sixty Years Ago Are Good Today

THE question of a Federal department of education is an old one. Presidents Jefferson and Madison recommended that the Constitution be amended to permit the establishment of one. They wanted to list education as an "internal improvement" of the kind which they claimed could not be appropriated for by Congress. President Grant later urged the establishment of such a department. Meantime, one was established and quickly disestablished.

In 1866 Congress set up a Department of Education, headed by a commissioner who, as with the then commissioner of agriculture, had no seat in the Cabinet. Two years later it was abolished and the present Bureau of Education set up in its place.

The creation of the department in 1866 was largely due to agitation for a research bureau by teachers and school superintendents who only a few years before had organized on national lines. The passage of the act creating it was due in most part to the eloquence and parliamentary skill of James A. Garfield, then a leader in the House of Representatives. Garfield made a masterful oration in support of the bill but his words were devoted mostly to the importance of education.

One needs only to read the debates on the subject to see that the chief thought behind those members of Congress who led the fight for the bill was not the value and importance of education *per se.* It was the value and importance of education, *in certain sections of the country,* being guided so as *to comport with the political opinions of those then in national power.*

Said Jehu Baker, of Illinois, one of the bill's proponents:

> "It is clear to my mind that to some extent and in some sense we should have in this republic a system of national education. That is required for great political considerations."

Said Senator Sumner:

> "Through the agency and under the influence of the national government *education is to be promoted in the rebel states.* To this end we need some central agency."

Said Ignatius Donnelly (in specific support of a department of education):

> "We find, if the reports that are published in the newspapers are to be believed, that a large number of these men (Southern Negroes) just snatched from slavery are voting on the side of the very men who made rebellion against the government . . . in one state 30,000 have so voted . . . We cannot send suffrage to these people unless we send education to accompany it."

Said Representative S. W. Moulton of Illinois:

> "We want all these school systems all over the country brought under one head, so that they may be nationalized, vitalized and made uniform and harmonious as far as possible."

While the department had power only to collect and distribute information, its sponsors declared that this was only a temporary arrangement.

Even as thus circumscribed, Congress quickly was sickened by the thought of what a department of education might lead to. The Freedmen's Bureau, with which the Department of Education was rated as a twin undertaking, soon provided a good illustration of the danger lying in the venture.

Elihu B. Washburne, a leader in Congress at that time, declared:

> "This department was established when we were in the mood for establishing everything, and making appropriations for everything."

Fernando Wood, of New York, claimed:

> "This department is likely to fall into improper hands and so be used for improper political purposes."

Abner C. Harding said:

> "I am jealous of national establishments for

China, a Land of Gods

Great Influence of Kitchen Deity

By MRS. L. M. CRAMER

CHINA is a land of gods, and yet its people are not a religious people judged by the religious standards set by the western world. True, the Chinese worship their gods. Each household, no matter how poor and lowly it may be, has its own household gods, worshipped by each member of that family; but this devotion is an outward one, born of a fear to do otherwise. Deep within the Chinese heart there seems to be no love, and no reverence for the object worshipped. True, there is a great deal of sacrificing done to the gods throughout the land, but it is not due to the same reverence the Christian has for his God.

One illustration of these sacrifices is to be found on an island called the Holy Island, off the coast and south of Ningpo, where live a half-dozen monks of a so-called religious order, who have allowed themselves to be sealed within cells barely large enough to permit of their standing in a stooped position, and of sitting down in a cramped one. They can never again stand erect, and never again lie down to sleep. Their only connection with the outside world comes through a two-foot opening in their bricked-in cells, through which their coarse food is served.

When they die a mason will close that opening and they will be buried in the little cell that has witnessed their living death for years. One of these monks has been a captive there for more than twenty years, and yet, so it is told, his living sacrifice is not an example of devotion to any god, but a vow fulfilled if the gods would protect him from a fate he feared.

Every temple has its gods, not one or two, but is filled with them—big gods, little gods, bad gods and good ones, good looking gods, tolerably good looking gods, and ugly gods; and each family either chooses or inherits a collection of its own.

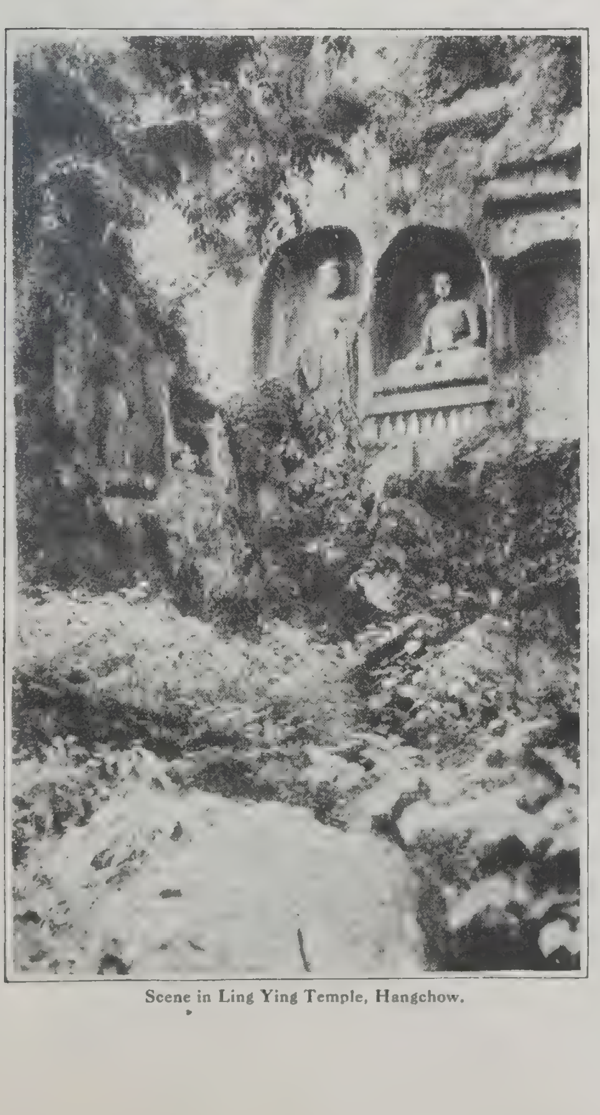
But among the innumerable gods worshipped throughout the land, none is better known or more feared than the kitchen god. His worship is universal.

The kitchen god is a flimsy paper deity whose temple is a niche in the brick cooking range of the Chinese home. Also, whether you know it or not, usually one is to be found in the home of the "foreign devil" residing for a time in the Orient. The Chinese cook is very rare indeed who will stay in a kitchen where this deity is denied a place.

About sixty millions of these flimsy kitchen gods are made each year in China, and a month after the Chinese New Year has passed it would be next to impossible to buy one for love or money.

The kitchen god, as has been said, is a printed god on the cheapest and flimsiest of Chinese paper. He is printed in the most vivid colors, green, red, yellow, and sometimes a touch of gilt here and there. The touch of gilt makes him cost a bit more, sometimes as much as five coppers. Ordinarily he costs less than half a cent, American money.

He is worshipped twice monthly, at the new and at the full moon, and in addition he is thanked by a feast on the fourth, fourteenth and twenty-fourth of the sixth moon, and on the twenty-fourth of the eighth moon.



Scene in Ling Ying Temple, Hangchow.

"Every empire has an emperor and every family has a ruler," is an oft-quoted Chinese proverb, the ruler of the family being the kitchen god whose duties are manifold. He knows intimately the faults of the family, and he takes account of their sins. He stands between the family and the Pearly Emperor, and is, therefore, an object to be feared and honored.

On the twenty-fourth of the twelfth moon, which is but one week before the China New Year, the kitchen god ascends to heaven to report to Shang Ti, the Pearly Emperor, everything he has seen during the year. He returns home again on China's New Year's eve, but when he returns he is reborn—by the simple process of spending a few coppers for a new piece of paper, on which is printed a new god whose likeness is akin to that of the old god, who was burned.

Stone figures at Ya Fei's tomb.

The ascension of the god to the Pearly Kingdom is accomplished by placing his picture in a little bamboo lamp stand, which has been covered by red paper to represent a sedan chair. Into this creation some watermelon seeds are usually placed, that the god may have sufficient to eat on his long journey. Then the whole is taken into the courtyard, if the family is one of means, or into the street outside the door of the mud hut if the family is poor, and set on fire. But before the match is applied an unholy liberty is taken with his godship, for his mouth is smeared with a thick sirup, so that he will be able to tell only sweet things of the family whose guest he has been for the last twelve months, and tell none of the bad things that may have transpired within that time in the household of which he was the ruler.

The match applied, the god burns rapidly, and in the curling smoke that rises he will ascend direct to heaven. Naturally the supreme ruler of the Pearly Kingdom will be influenced in his disposition of favors by the report made by the kitchen god of the hospitality and kindness that has been shown his humble satellite during his stay below.

As the kitchen god is burned and started heavenward, some male member of the family, preferably its head, will chant a verse, which, roughly translated, runs something like this:

> "Come, god of the kitchen, whose name is Chang,
> Now here is your pudding and here is your t'ang (sirup);
> When you get up to heaven it will make us all glad
> If you tell what is good and omit what is bad."

But sometimes, and generally with reason, it must be surmised, the family may fear that a bit of sirup may not sufficiently seal the old god's lips, and in such case it is nothing unusual to see a little opium being smeared over the sirup before the match is applied, so that he may be too drowsy by the time he has reached his journey's end to talk and tell what he knows. Sometimes a little wine is poured on his head, to insure his being so drunk by the time he has reached the Pearly Kingdom, that he will be turned out and not allowed to speak.

Despite the fact that he has been worshipped and kowtowed to twice each month, and despite the fact of several special feasts having been prepared in his honor, and for his pleasure during the year, there is nothing in the manner of his departure that would indicate love for him in the household he is leaving. It is fear and fear only.

The kitchen god takes seven days to get to heaven and return, and in that time, if the household is so minded, it may cut up high jinks with impunity, for there will be no one to report unfavorably. At the end of the seventh day a new kitchen god is installed and a new round of feasting and worship begins.

Idols in Bubbling Well Road Temple.

Another of the greatly feared gods in China is the fire god, a creature represented by fiery red hair and whiskers, who holds a red crow in the palm of his right hand. It is this crow that does the mischief, committing arson on its flights away from the godly palm. Incidentally, only while the bird is safely anchored in the palm of the fire god's hand, is anyone assured of respite from fire. If no one has ever seen the bird leave that palm, it is a matter of small moment—there have been fires, have there not? Then why argue!

When an idol is made, the creator of it cuts a small trapdoor in its back. Into this cavity are placed, at the proper time, all the "vital organs" without which the god may not be worshipped. But no idol or god is supposed to be completely finished until after it has been set up in the place which shall afterward be its home. Once there, on a lucky day and in the presence of the entire family, if it is for a private family, or of leading representatives of the guild or temple if it is to be publicly worshipped, the idol-maker inducts the spirit of the god into the body he is to operate. This is a far more simple operation than the Occidental mind might conceive. The "vital organs," made of silver and conveniently strung together on a silver chain, are placed in the god's body through the trapdoor. Before the door is sealed there is imprisoned with the silver "organs" a small insect, bird or reptile. and the door is quickly sealed so that the life within cannot escape. and in this way the idol-maker secures the "spirit" within his god.

But even this does not complete the god. The finishing touch is when the idol-maker "lets in the light," which he does when he dips his brush in black or red ink and touches the pupils of the god's eyes, these pupils having been left blank up to this time.

Images made for the very wealthy Chinese often having "vital organs" made of jewels, jade and other precious stones. That is why plunderers in a city so often break open the household gods, that they may get at their interiors and pillage them.

At the time of the Boxer Rebellion, after the fall of Pekin, it is told, when soldiers were sacking the city, a group of soldiers were destroying three ten-foot high clay images. But after these images were in ruins on the ground, and when the soldiers were pawing amid the ruins, hunting for the massive silver "innards" they expected to find, they discovered that the idol-maker had cheated, and had put into these images only half-inch silver lungs, liver, heart and kidneys, and their disgust knew no bounds. "No wonder they could not protect themselves from us," said one. "How could they have courage with so small livers?" The Chinese believe that the liver is the seat of courage.

The Chinese take their gods very seriously. Gods before now have been haled into the Shanghai courts for complicity in crime. A story is told of a clay image that was suspected of aiding and abetting a dishonest priest in some evildoing. The idol was ordered by the court to kneel down. Upon its inability to do so (which was taken as a refusal to comply with the court's order), the court sentenced him to be punished by 500 strokes of a bamboo beater. When the punishment was ended the idol was a heap of powdered clay upon the floor.

Upon another occasion—this happened in Wuhu—the dragon king, held responsible for rainfall, was impervious to prayers, requests, demands and threats for rain. Finally the drought became so bad that it was decided that the idol should be taken out into a field and set up, that he might feel the broiling hot sun on his head. There he was left all day to meditate. When nightfall came he was carried back into the temple and told that unless rain fell that night, he would be taken out under the burning sun the following day.

That night there was a thunderstorm, and doubting Thomases returned to their idol to worship.

Father Louis Hennepin's map of the Great Lakes. Printed at Amsterdam in 1690. The Lakes were still greatly distorted.

By LOUIS C. KARPINSKI

THE Great Lakes with the St. Lawrence and the Mississippi River with its tributaries make the interior of North America the greatest industrial center of the world. The thrilling story of the step-by-step discovery of the Great Lakes is largely one of French achievement. The representation of the St. Lawrence with the Great Lakes upon the map was accomplished only by the united efforts of explorers, priests and traders over a period of two hundred years. Many of the priests combined a passion for discovery with a passion for souls. But it must also be recorded that the rivalry between the Jesuits and the Sulpitians and the Recollets frequently contributed no little to the zeal of the wearers of the black robe.

Centuries before Columbus, the Norsemen fished off the coasts of Labrador and entered the St. Lawrence only to have the memory of their visits lost for centuries, and with no part in the rediscovery of the region. Following closely upon Columbus the English represented by John Cabot reached Labrador and Newfoundland and before 1500 the eastern coast of the United States. Cabot mentions the codfish of the region where he first landed. Probably from 1500 on, the coasts of Newfoundland saw many fishing expeditions by Breton and English mariners. Canada, upon the early maps, was designated as the land of the codfish. The fish played their part in making the country known and the beaver furnished the inspiration for many of the later expeditions.

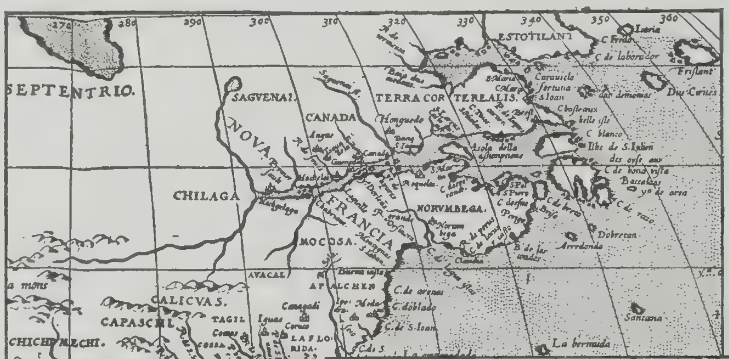
The navigator, Gaspar Corte-Real, began in 1500 the explorations by the Portuguese of the Newfoundland region. From Greenland and Newfoundland on his second voyage Gaspar Corte-Real sent back two of his ships, but he himself continued the exploration and never returned; "his brother Miguel, a year afterward, met a similar fate," so records a Portuguese map of 1520, referring to the rescue expedition by Miguel Corte-Real in 1502. The Portuguese discoveries in the entrance of the Gulf of St. Lawrence are duly recorded upon a map with Portuguese inscriptions made by one Pedro Reinel in 1505 or 1506. The voyage by Joano Alvares Faguendas before 1521 marks the end of Portuguese activity, but for a long time Terra Corte-Real appears on the maps and even today such names as Cape Race (Raso), Cape Spear (Espera) Bonavista, and Conception Bay bear witness to the early Portuguese ventures.

Verrazzano in 1524 arrived in the service of the French in the St. Lawrence region. Ten years later Jacques Cartier, a Breton sailor, entered the Gulf of St. Lawrence through the northern strait of Belle Isle and sailed as far west as the northern end of Anticosti Island. Here a broad expanse of water opened to the west and here Cartier hoped was found, at last, the water route to the Pacific Ocean, then known as the Sea of the South. His ships were not equipped for a winter stay and reluctantly Cartier turned back to France, taking two young Hurons back with him.

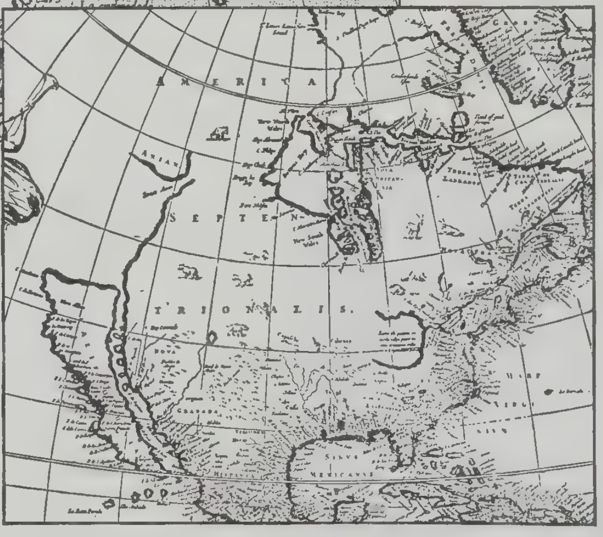
On May 19, 1535, three ships again sailed out from St. Malo, under Cartier and after a rough voyage entered on August 10, the holy day of St. Lawrence, a small bay (Pillage Bay) to which the Frenchman gave the name Baye Sainct Laurens. This name made an appeal to cartographers and was applied to the large bay, first, and then also to the river itself.

The two Indians, Targnoagny and Domagaya, whom Cartier had taken with him, were thoroughly familiar with the river and directed the course of the vessels to the region of Quebec. From the Indian accounts Cartier regarded the northern country as divided into three kingdoms: Saguenay, Canada (vicinity of Quebec) and Hochelaga (Montreal). Canada, in the Huron-Iroquois language, signifies "town," and to Cartier signified the chief town of the region of Quebec. On the seventh day of September, 1535, the Frenchmen landed below Quebec with their Indian interpreters, now at home. The returned Indians were feasted and fêted and the Europeans were welcomed as friends. The chief of these Indians, Donnacona, made long and possibly tedious speeches of welcome, a custom of the Hurons as well as of later natives of the lake region. The beauty of the Quebec scenery, with the fine forests of oak and elm, chestnut, cedar and hawthorn, appealed to the French. Here two of the ships were put in dock for the winter and the *Emerillon,* carrying two small boats, was designated for the further voyage up the river.

On the second day of October the two small boats, having left the *Emerillon,* arrived at the Indian village of Hochelaga. Within a circular stockade probably 800 feet in diameter were about fifty houses, ranged about a public square; the village accommodated approximately 1,500 Indians. The Indians welcomed the strange white men with feasting and with dancing. Yea, the Indians brought the halt and the lame, expecting that the touch of the white man would heal. Cartier, a devout and kindly soul, read to the wondering natives the beginning of the Gospel of St. John and the account of our Lord's Passion. The nearby mountain attracted the attention of the voyagers and to this Cartier gave the name Mont Royal. This is the name today and the city is named from it, Montreal. From the summit Cartier and his companions were the first white men to view the west which waited fully seventy-five years for other Frenchmen to penetrate. Unfortunately Cartier's two Indian interpreters had been moved to stay with their friends in Quebec, after having made every effort to prevent Cartier's further progress to the west. In consequence Cartier's communications with the natives of Hochelaga was largely by sign language, and not eminently successful. During the long hard winter, which these Frenchmen spent in the Quebec region, scurvy claimed twenty-five of the group. Many of the rest were saved only by the use of an Indian remedy, an infusion prepared from the bark and the leaves of the balsam fir.



Ortelius map of 1570. The River without any Great Lake.



Visscher's map of 1640. One Great Lake—incomplete.

Preparatory to the return voyage to France, Cartier seized the chief, Donnacona, and some five or six other leading Indians. Cartier wished to impress the King of France with chieftains, but this unfriendly act had no little to do with the failure of the following French sojourns under Cartier in Canada. In France these Indian chiefs were kindly treated, converted to Christianity, and it was probably in the faith that the poor Indians died. The contact with civilization was deadly for the adult Indian, accustomed to a vigorous outdoor life.

A printed account of Cartier's first voyage did not appear until 1556. It is included in the famous collection of Voyages by Ramusio, printed at Venice in Italian. Cartier's own account did not see the light until 1867. Of the second voyage a French account, "Bref Recit," appeared at Paris in 1545 and of this work only one copy survives, the fortunate possession of the British Museum.

Five years elapsed before the French could turn attention from internal troubles to the lands across the sea. Jean Francois de La Roque, Sieur de Roberval, was made lieutenant general, in charge of the expedition. However, the noble lord began his part of the enterprise with delay and ended it with disaster. On May 23, 1541, Cartier, with five ships, sailed once more to the St. Lawrence Gulf. Roberval sailed the following spring and in the harbor of St. John's in Newfoundland encountered Cartier, returning to France after a trying winter again near Quebec. The Indians had remembered the seizure of their chiefs and gave no friendly assistance to Cartier and none to Roberval. The third French attempt to winter in Canada was most disastrous, ending in the death by scurvy of more than fifty of Roberval's men. Little further was added by these two sojourns in Canada to the knowledge of the region beyond that learned by Cartier in the autumn of 1535.

In 1544 appeared a map by Sebastian Cabot upon which the St. Lawrence River appears without any trace of lake. In this form the St. Lawrence is commonly shown until the time of Champlain. However, Cartier had through the Indians acquired knowledge of a great lake somewhere in the west. In 1566 Laferi put a lake at the end of the St. Lawrence and Mercator, in 1569, added a lake upon the basis of Cartier's account, to one of the rivers tributary to the St. Lawrence. Cartier's grand nephew, writing in 1587, refers to a similar map by Hakluyt, as placing the lake entirely too far north. Cartier's own map with a lake is mentioned by this nephew, but the map itself has not been found.

Political and religious wars occupied the attention of the best minds of France for many years after the time of Cartier. The time was not propitious either for exploration or for colonization. However, the Edict of Nantes in 1598 made it possible for the Huguenots to live in some peace and made it possible for representatives of various faiths to devote themselves to the real interests of France. Colonization plans began about 1600 with a few Calvinistic leaders, but the expeditions were failures.

The successful revival of interest in the French discoveries was due to Samuel de Champlain who combined skill as a navigator with exceptional interest in scientific exploration. In addition Champlain had a truly modern vision of the desirability of publicity for great enterprise. The accounts of his voyages to the New World are so full of interesting and instructive detail, with illustrations and maps by Champlain himself, that they were read with the same enthusiasm that a century before had greeted the letters of Amerigo Vespucci. Champlain was a born geographer, able as a cartographer and interested in recording geographical peculiarities. Above all Champlain was a man of commanding appearance and of fine personality; a strong man in whom both Indian and white man had, with every reason, instinctive confidence.

Champlain first visited America in 1599 as captain of a Spanish ship, spending two years in the West Indies. Champlain's own account, decorated with colored drawings, is now in the John Carter Brown Library at Providence, Rhode Island. Commissioned by Henry the Fourth of France, Champlain began his Canadian enterprise on June 11, 1603, with the brief exploration of the Saguenay. About a month later the former site of Hochelaga was reached. By questioning the Indians Champlain learned of the great lake (Ontario) farther up the river, and of a fall "somewhat high" (Niagara), and . . . . another lake (Erie) some sixty leagues long . . . .; at the end they come to a strait (Detroit River) two leagues broad and it extends far into the interior. Here Detroit makes its first appearance in history. This French word "Detroit" for "strait" should be associated with the Indian word for "strait," "Quebec," for both represent the romantic as well as the commercial side of American history.

Early in 1604 Champlain published his report of the Canadian voyage under the title: *"Des Sauvages: ou Voyage de Samuel Champlain, de Brouage fait en la France Nouvelle, l'an mil six cents trois,"* "The Savages of, or Voyage of Samuel Champlain of Brouage, made to New France in the year 1603."

The winters of 1604, 1605 and 1606 were spent by Champlain associated with a fine group of noble Frenchmen in Nova Scotia. Here the first permanent colony not Spanish was founded in Northern America. Acadia appears as a colony and by Longfellow has been immortalized in Evangeline. The country was thoroughly explored and Champlain's descriptions of the coast of Maine and of New England were the first with correct geographical detail.

The lure of China and India continued with the French and with the English. That able navigator and romancer, Captain John Smith, was attempting the passage by Chesapeake Bay; Sir Francis Drake sought the passage by the north in 1578; during the time of Champlain's later activity in the Great Lakes region Henry Hudson for the Dutch was seeking the passage first (1609) by the river which bears his name and then (1610) by the northern strait and by the bay now Hudson's Bay.

Champlain in 1608 entered upon his life's work as founder of Canada, beginning in that year with the establishment of Quebec. The Hurons and Algonquins occupied much of Canada and with them Champlain had of necessity made alliance. This involved the enmity of the Iroquois to the south and their incessant warfare hindered the French and contributed to the final English domination. The first real encounter with the Iroquois took place in 1609 near Ticonderoga directly after the discovery of Lake Champlain. Here the unfortunate Iroquois first learned of the deadly weapons of the white man and with this knowledge began the Indian warfare, as we know it. Before that time, as pictured by Champlain, the Indians fought in solid ranks, but powder and ball soon taught them the necessity of new methods.

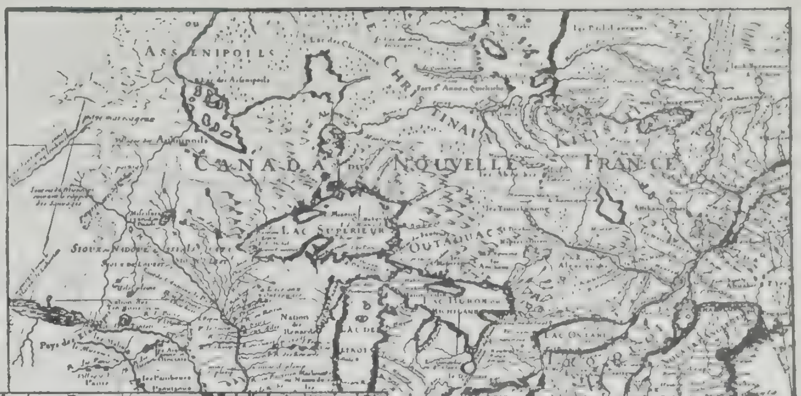
Except the winters of 1612 and 1616 each year saw Champlain prosecuting some new venture in Canada. Young Indians came to learn the white man's tongue and ways; young Frenchmen spent winters with the Indians learning the red man's tongue and his ways. Among these was Etienne Brulé who spent the winter of 1610 with the Hurons and whose name appears for many years in the annals of the Great Lakes.

The year 1615 marks an epoch in the history of New France, for in that year four members of the order of the Recollets began in Canada the priestly ministrations which have not ceased to the present day. Indeed the history of Canada from the advent of the Jesuits ten years later until the middle of the eighteenth century consists almost wholly of Jesuit Relations, the accounts sent by the Jesuits to the head of their order.

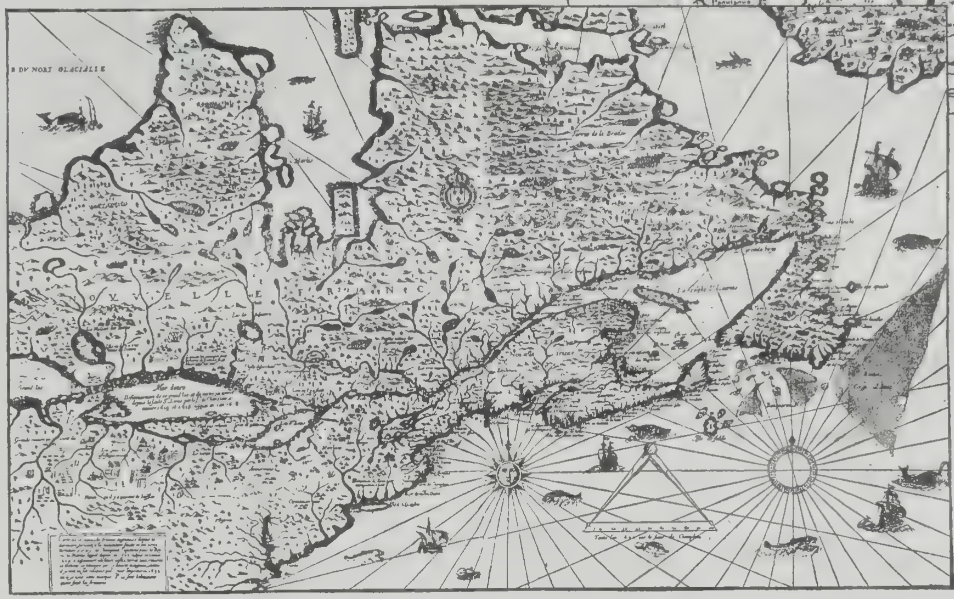
One of the Recollets, Joseph le Caron, spent the winter of 1615 with the Indians on Lake Huron; he shares probably with Etienne Brulé the distinction of being the first of the white men to gaze upon any of the Great Lakes. During this winter, full eighty years after Cartier had looked so longingly and so wonderingly toward the West, Champlain arrived at Lake Huron. In Champlain's *Voyages et découvertes,* printed in 1619, the author begins his description of the expedition of 1615, as follows: "The strong love which I have always cherished for the exploration of New France has made me desirous of extending more and more my travels over the country, in order, by means of its numerous rivers, lakes, and streams, to obtain at last a complete knowledge of it, and also to become acquainted with the inhabitants, with the view of bringing them to the knowledge of God." Returning from the *Mer Douce,* or Peaceful Sea, as Champlain called Lake Huron, the explorer turned south and arrived at the "lake of the Entouhonorons," the Indian word which is our "Ontario," and proceeded across Lake Ontario as far as Lake Oneida. During this long winter sojourn among the Indians Champlain returned again to Lake Huron and then the next spring by way of Nipissing back to Quebec. In spite of Champlain's great love of adventure, Lake Huron and Lake Ontario were the only two of the Great Lakes with which he had direct contact.

Champlain's long sojourns in Quebec were interrupted in 1629 by the capture of that stronghold by the English, which they held for three years. In 1633 Champlain returned to Quebec and in 1634 he sent one of the French interpreters, Jean Nicollet, on an exploration trip which placed Lake Michigan upon the map and made Lake Superior accessible. In October of 1635, not long after the return of Nicollet, Champlain had a stroke and passed away on Christmas Day. In his death passes from the North American theater of activity a man who combined the noble character of the flower of French chivalry with a real passion for learning and imparting geographical knowledge. Champlain united an intense desire for advancement of knowledge with the qualities of mind and body and soul necessary for success.

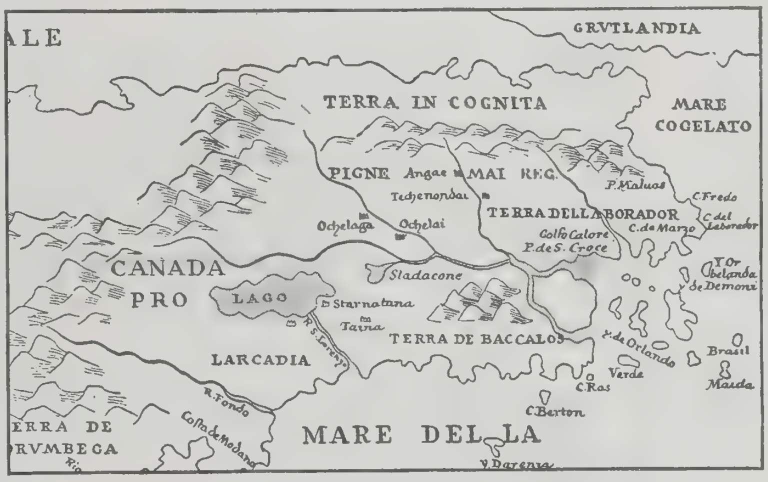
Before the death of Champlain the Jesuits were given exclusive rights to missions in Canada. In the following years their amazing courage and their full measure of devotion to the service of the Cross stands in sharp contrast to the fiendish cruelty of the Iroquois and their allies.



Correct map of 1701 by Delisle. First map with Detroit upon it.



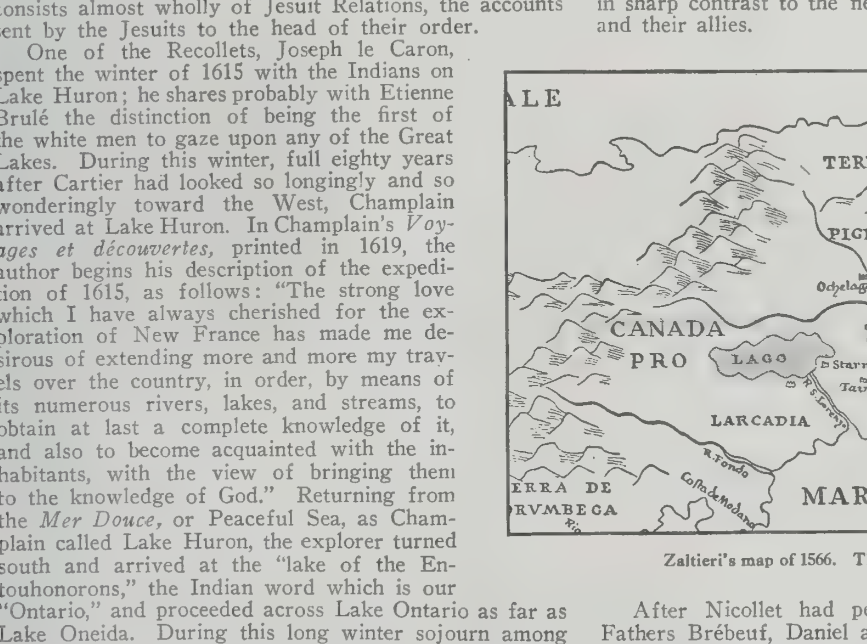
Map by the founder of Canada, Champlain. Three Great Lakes indicated, 1630.



Zaltieri's map of 1566. The river with one Great Lake.

After Nicollet had penetrated to Lake Michigan, Fathers Brébeuf, Daniel and Davos went again to the Hurons. In 1641, Fathers Raymbault and Joques were sent to found a mission at the Sault (Ste. Marie); "Father Raymbault hoped to reach China . . . . but God diverted his path to heaven," so runs the Jesuit Relations, telling of the death of Raymbault and incidentally of the definite discovery of Lake Superior. Possibly the interpreter Etienne Brulé had been here and also to Lake Erie in his winters among the Indians; however, the accounts by Brulé of both lakes were not sufficiently definite to place them upon the map.

The English meanwhile had arrived at Plymouth and in Virginia, and the Dutch were in New York as far as Albany. The English and Dutch were colonists first, and traders, explorers, and missionaries incidentally. This may well account for the greater permanence of their achievements. The whole interest of the English and Dutch residents was in America; with the early French, success implied return to France to enjoy the success.



Sanson, Royal Geographer, map of 1656. First to show Lake St. Clair. Two of the Great Lakes with open ends.

In 1650 and in 1656 two maps of the Great Lakes region were printed by the famous French geographer Sanson. These maps represent Lakes Ontario (called also Lake St. Louis), Erie, or Lake of the Cat, and Huron, or Karegnon, in approximately proper positions; Superieur, called Lacde Puans, left with open ends toward the west. The information for these surprisingly correct maps probably came through the Indians to the Jesuits and thus to Paris.

One of the most interesting and enterprising explorers appeared upon the Canadian horizon in 1651 in the person of Pierre Esprit Radisson of St. Malo, Cartier's home. Captured by the Iroquois in 1652, when 17 years old, Radisson lived more than a year with the Indians as an adopted son, learning their language and living their life. After his escape through Dutch aid Radisson returned to Canada to enlist his brother-in-law, Medart Chouart Groseilliers, an adventure-loving trader, in fur-trading enterprises to the Great West. Between 1556 and 1564 these two men penetrated Michigan and Minnesota and beyond the Mississippi River. Only recently (1885) Radisson's fine account was published; the manuscripts containing the account are in the Bodleian Library at Oxford and in the British Museum, having existed two centuries and more, unused and unknown. Radisson gives a wealth of interesting details largely confirmed by Jesuit records. One winter of famine was spent by the two Frenchmen among the Hurons and the Sioux. Radisson relates that two visiting Indians, also starving, came with a dog: "That dogge was very leane . . . The dogge comes out . . . by good like (fortune). I take him and bring him a litle way. I stabbed him . . . broyled like a pigge and cutt in peeces . . . so every one of the family had his share." Even the beaver skins were boiled by the Indians of whom probably a third perished of starvation. Longfellow's Hiawatha does not exaggerate the winter tragedies of the Indians.

The fur and the copper kept the French interested largely in the northern route from Montreal by the Ottawa River. A wholesome respect for the Iroquois contributed to the same end. Not until 1653 is there definite record of any white man on the St. Lawrence in the vicinity of the Thousand Islands when Father Poncet, of the Jesuits, came down the river. A year later Pére Le Moyne was the first on record to ascend the St. Lawrence.

Trader and priest finally achieved French recognition of a great inland empire of the west. In spite of a group of noble leaders in France, in Quebec and on the frontier, the recognition came a little too late for permanent French colonies, but not too late for a continuation of French devotion unto death in the path of glory toward the rising sun. Colbert, French controller of finance, instituted the Company of the West; Courcelles as governor and Jean Baptiste Talon as intendant with large civil power were sent by Colbert in 1665 to seize the West. Their troops were adequate to disperse the Iroquois and for twenty years the St. Lawrence Valley lived in peace.

The Jesuits sent Marquette in 1668 to the station at Sault Ste. Marie and in 1669 to the mission at La Pointe, near the western end of Lake Superior, established by Allouez in 1665. In the year 1669 Louis Joliet, a Canadian born and bred, having been to the copper mines, returned to Montreal and was the first white man to make the trip by the Detroit River, by Lake Erie, by Lake Ontario and by the St. Lawrence. This grand circuit of the Great Lakes from the Sault to the St. Lawrence was thus completed by Joliet who, four years later, with Jacques Marquette made the first real exploration and scientific discovery of the Mississippi.

Near to the western end of Lake Ontario, Joliet encountered three Frenchmen seeking a way to the Ohio River. The Indian accounts of the Ohio and the Mississippi had begun to attract well-merited attention. Robert Cavelier de La Salle sold his estate near the Lachine Rapids and enlisted two Sulpitians, Dollier de Casson and Galinée, in an enterprise to find the great river which La Salle hoped led to the western sea. Joliet's account persuaded the priests that the route by Lake St. Clair would lead them to tribes to whom they desired to minister. La Salle left them and may have discovered the Ohio during his uncertain wander-

Wheat Farmers Drop Two Millions a Year

Story of the Northwest Growers Record in Costly Marketing

By ROBERT MORGAN

IT COSTS money to know Aaron Sapiro. The American wheat farmers of four northwestern states are just beginning to find out at the middle of 1924 that it cost them approximately two million dollars annually in 1921, 1922 and 1923, to make the acquaintance of the clever gentleman from San Francisco. They have learned, too, that though they know Mr. Sapiro, and some other gentlemen quite well, Mr. Sapiro does not recognize them; indeed, he seems to have forgotten them entirely, having removed himself to greener pastures, and more unsuspecting agriculturists.

Below—Home of a prosperous wheat farmer in the state of Washington. It is on such homes and farms as this that the Sapiro-promoted co-operative marketing associations seek to fasten their grip by making *the lands of the farmer responsible for the debts of the association.*

The story of this disaster—in which an American industry lost at least six million dollars in three years, and probably much more—is the story of the Northwest Wheat Growers Associated, an organization designed, sponsored and put into operation by Aaron Sapiro. It is reported, and it has not been denied, that Mr. Sapiro received $7,000 for permitting the states of Washington, Oregon, Idaho and Montana to use his California co-operative marketing plan in the formation of this association. It is further reported, on reliable evidence in the hands of independent wheat producers in the Northwest, that Mr. Sapiro received, in addition to the $7,000 mentioned, $1,000 each from Oregon, Idaho and Montana, for permitting them to use his California marketing plan in the organization of their local or state associations. All four of these states, after paying Mr. Sapiro for his counsel, merged their state associations into the Northwest Wheat Growers Associated, which Mr. Sapiro had carefully prepared for them. As previously mentioned in this series, the plan of the Jewish ring which is exploiting the American farmer is to form first local, then state, then sectional, then national associations of the producers of each crop in the United States, eventually bringing the marketing of the world's production of each agricultural product into the control of a central organization of "big internationalists."

There is nothing to show that Mr. Sapiro ever received from any or all of these northwestern states a cent more than the $10,000 he is reported to have "accepted" for showing the farmers how to invoke three years of disappointment. But it would have paid the farmers of these states to have given Mr. Sapiro one hundred times ten thousand dollars to remain south of the northern boundary of California. One A. A. Elmore, president of the Washington Farmers' Union, and a radical whose schemes the more conservative members of the union had to thwart on a number of occasions, met Sapiro in Oregon, in 1919. With avidity Elmore seized upon Sapiro's plan, and, without consulting the Farmers' Union, made the San Francisco Jewish promoter the principal speaker at the January, 1920, convention of the union, in Spokane. The Farmers' Union is a sane, sound organization, which has accomplished a great deal of good for agriculturists of all classes in its state. It has repudiated Sapiro in every way; in fact, as an organization it has never supported him.

Out of this speech of Sapiro's at Spokane, grew the Northwest Wheat Growers Associated. Nominally, it was to consist of three similar state associations in Washington, Oregon and Idaho, each having no stock, taking no profits, with the associated as a sort of binder to co-relate and co-ordinate the activities of the state associations. Members of these state associations signed contracts binding them for seven years to deliver all their wheat to the association, to be sold when, where, to whom and at whatever price the association desired to sell it. In other words, the wheat producer signed away all right to, or title in, his crop for seven years, to an organization which he thought he controlled, but in which he soon learned he was a rank outsider. The association agreed only to pool the proceeds from all sales by grades and to pay the members the pooled average, less only the cost of operation. Montana came in later.

And, lest something in the way of money might get away from the association, and into the pockets of the farmers, a subsidiary corporation was outlined and formed "to own the necessary warehouses and elevators, while finances to pay growers a substantial amount on delivery of grain were provided by bank loans against warehouse receipts." I quote from Herman Steen, panegyrist for Sapiro and the Sapiro Plan.

Let us see what has happened to this Northwest Wheat Growers Associated, touted by the proponents of co-operative marketing on the Sapiro plan as the most successful grain-selling organization ever formed by co-operatives:

As I write these lines at the beginning of June, 1924, all of the four state associations are virtually out of business.

The Washington association being completely dead.

The Idaho association in the hands of a receiver.

The Montana association is defunct. The Oregon association is existing only in the persons of some of its officials, who are endeavoring to build from it a marketing organization of their own.

The Northwest Wheat Growers Associated, the holding association for the four state associations, is hanging on only because the law compels it to hang on until it can make a financial statement to the state government, a statement which it has not made to either government or growers at any time since it was organized.

Today, many of the members of these associations have not been paid for their 1921 wheat crop; more have not been paid for their 1922 crop, and if there is a single member of either the state or the northwest associations who has been paid for his 1923 crop, neither the farmers' unions of the states involved, the independent wheat buyers, the independent wheat growers, nor the writer have been able to find him.

These statements are the simple truth of the "success" of the Northwest Wheat Growers Associated, which Aaron Sapiro started in January, 1920, pocketed his fees, and left to its fate, as he has left every co-operative marketing association which he has formed. Ten thousand dollars a week is a fairly good salary; ten thousand dollars a year represents about double the annual income of the average American wheat farmer, yet Mr. Sapiro devoted seven days, actual working time, to the "organization" of the Northwest Wheat Growers Associated, and its four subsidiary state associations.

The average annual production of wheat in Oregon, Washington, Idaho and Montana is approximately 100,000,000 bushels. The Northwest Wheat Growers Associated claims to have handled from thirteen to fifteen per cent of that crop. The independent buyers in the field believe, from the relative quantities of their own purchases, that the average handled by the association was fifteen per cent. This means that 15,000,000 bushels of wheat were turned over to this association by the farmers each year in 1921, 1922 and 1923. These figures cannot be verified, because the association has never made a statement, but they have been declared to be true by Aaron Sapiro and by Walter J. Robinson, the present head of the Northwest Wheat Growers Associated. The 1920 crop sent only a comparatively small quantity into the association. Now read this, which is also the truth:

For the 1920 crop, the members of the association received $1.52½ a bushel, on the average, while the independent producers received $1.71 a bushel.

For the 1921, 1922 and 1923 crops, the independent growers received from ten to twelve cents more a bushel than did the Sapiro-plan co-operatives. But the latter still had to deduct twelve to fifteen cents a bushel operating costs.

The percentage of the 1920 crop handled through the Northwest Wheat Growers Associated is not known, but it is believed to have been approximately 6,000,000 bushels, possibly a little more. If it were 6,000,000 bushels, and if the farmer had received payment for all of it, as he did receive payment for most of it, he would have lost eighteen and one-half cents a bushel, or $1,083,000.

After the farmer in the Pacific Northwest had paid all the costs of preparing his land and planting and harvesting his wheat crop, he then had to pay approximately 30 cents a bushel for transportation, brokerage and warehouse charges, if he belonged to the Sapiro-promoted co-operative marketing association. The farmers outside the association paid only 15 cents a bushel for the same service. Photo shows the harvesting and threshing of wheat at one operation in the field with mules and horses as the motive power.

Giving the Sapiro co-operatives the benefit of their own claim that they handled fifteen per cent of the crops of the past three years, or 15,000,000 bushels a year, at ten cents a bushel less than the independents received, gross, for their crop the industry contributed $1,500,000 in dead loss to the management of the association. And, after this was sustained, the members of the association had to pay the expenses of the operation of their organization each year, at least half a million dollars more. A low and conservative estimate, based on the Northwest Wheat Growers Associated figures, shows that this Sapiro-Plan organization has caused a dead loss to its members of more than $2,000,000 a year for the past three years, to say nothing about 1920, and leaving out of all consideration the fact that the great majority of the growers have not received pay for one year's crop out of the three. The total loss to the American wheat producers of the Northwest, due to the appearance of Aaron Sapiro in Spokane in 1920, cannot be estimated, and never will be ascertained.

Of interest in connection with this, probably the most costly attempt to market a crop ever made in the world, is the following statement of the expense of handling the 1921 crop of wheat through the association. It is taken direct from a signed return by the association to one of its members. These are the charges taken out of the price received by the association for each bushel of wheat sold for its members:

Interest paid banks	$0.012
Interest paid to growers	.02
Shipping and storing	.016
Export charges	.014
Administration expense	.013
Office upkeep	.01
General reserve held out	.01
Special reserve to cover extra expenses	.022
Possible further payment on 1922 pool	.005
Total per bushel held out for handling costs only	$0.122

That is to say, twelve and one-fifth cents had to be taken out of the gross payment received by the association for every bushel of wheat, after that wheat had been sold at a price from ten to twelve cents below the net price received by the independent growers.

The total cost for handling the Idaho-Washington wheat crop for 1921, according to figures given by the association management to a member, was $850,000, which the members had to pay. The cost per bushel as shown in the above table, compares with seven cents a bushel, which the independent growers paid, and is nearly as much as the freight charges from common points in northwestern wheat territory to coast terminals. That is something else to think about, but the trouble with the farmer has been that he has figured the "operating costs" under the Sapiro plan too late to save his own money.

One of the large factors in the blinding of the farmer to the facts of the Sapiro brand of co-operative marketing, and in the concealment from him of its failures, has been the attitude of the press throughout the Northwest. One newspaper of Spokane, Washington, supported Sapiro and his followers throughout the organization period of the Northwest Wheat Growers Associated, refused to publish arguments against his system, made by farmers' unions, conservative bankers and farsighted wheat-growers, and when the inevitable crash came, persisted in its refusal to publish anything more than the bare statement that the local and state associations had suspended. This newspaper must share, with Sapiro and his representatives, the moral responsibility for the great loss that befell the wheat farmers of the Northwest. Other newspapers throughout the four states followed similar tactics, and the members of the defunct Sapiro associations, their eyes now wide open, claim that Jewish advertisers, and Jewish influence, were responsible for these newspapers failing in their obvious duty to the American people of their territory.

As in the case of the hay-growers, gangs of radicals, former agents of the Industrial Workers of the World, men notorious for their communistic tendencies, and

(Concluded on page 14)

Is Fair Trial by Jury Possible in America?

Question Becomes One of Autocracy as Opposed to Democracy

By C. C. DANIELS

AN EARNEST and systematic effort is being made to do away with trial by jury and substitute trial by judge.

Great pains are being taken to impress upon the general public and the legal profession the idea that those who compose the juries are wanting in intelligence sufficient to understand the evidence and apply the law to the facts, to enable them to render a just verdict on the issues submitted.

At almost every meeting of the various bar associations the work goes on by speech, personal intercourse and resolution to discredit trial by jury. The meetings of various chambers of commerce are utilized for the same purpose.

The wisdom of our forefathers, who wrested from autocracy and oppression the right of trial by jury, is held to scorn and the superior wisdom of the present day extolled with complacent persistency.

Back of this propaganda are influences that seek to change the fundamental basis of our civilization and to take from the average man all effective participation in the affairs of Government; to substitute for the composite judgment of twelve jurors, who are drawn from and return to the body of the people, the decision of one judge, who may be dependent for his place and power on the political influence of those who dictate nominations, elections and appointments.

Between the two systems runs the line that divides democracy and autocracy.

Most of those who denounce jurors and throw the weight of their influence against trial by jury and in favor of the autocratic one-man system of judge-dominated courts are conscientious and sincere and would resent any suggestion that they have lined themselves up against the fundamental principles of a free people and a democratic government.

Members of the legal profession especially resent the suggestion that their opinions on public questions are influenced or controlled by those who employ them. Yet it is not difficult to forecast the opinion and position of many lawyers on public questions if you know who are their clients. Of course there are many exceptions to this rule, but the exception proves the rule.

Those who assail the jury system most vigorously are often potential in selecting those who constitute the juries. The names of those who are placed in the jury box are carefully selected. They are supposed to be chosen with a view solely to securing men "good and true," competent and capable of weighing evidence, and, divesting themselves of prejudice, to render a just verdict based on the evidence without fear or favor.

The Process of Selection

HOW are the names selected that constitute the jury panel; who makes the selection; what are the influences dominating those who select the names that go in the jury box? Whether these influences are patriotic or sinister are factors of which the general public knows little, although the results may be far-reaching.

The selection of names for the jury list in the law courts of towns and small cities is generally conducted without favoritism or trickery, but in large cities the names can be juggled with less fear of detection. In cities like New York and Chicago, the restraining influence of public censure and the inspiring influence of public commendation do not make themselves felt to the same extent. The corrective power of stable, intelligent public sentiment is conspicuous for its absence, and "jury-fixers," special corporation agents, and other interested parties, can get in their work with a maximum of efficiency and a minimum of publicity.

The first step toward securing just trial by jury is to select the names that go in the box from which the jury is drawn. If the names of the right kind of people are not selected, the right sort of jurors cannot be drawn. "The fountain can rise no higher than its source."

How are these names selected; who makes the selection and what are the influences that control?

The names that go in the jury box are selected by a jury commission, and in the naming of this commission "crooked business" sometimes gets in its most effective work. A careful scrutiny of the personnel of the men who compose the jury commission in many jurisdictions, and an analysis of their connections and employment would tend to make many litigants accept any compromise offered rather than put themselves at the mercy of jurors selected by such a "hand-picked" commission.

Some years ago I was in charge of important litigation in a western state for the Department of Justice in which property of large value was involved, and in the outcome of which the happiness and welfare of many of "the wards of the nation" would be seriously affected. Public interest had been aroused in the subject of the litigation and many people in one-half of the state were directly or indirectly financially interested in the outcome of the litigation, and it was apparent that to secure an impartial jury in that section of the state where the trial would be held was very difficult. Under these circumstances one of the attorneys on the force went before the judge and requested him to direct that the jury be drawn from a section of the state where the people had no financial interest in the outcome of the litigation. The judges indignantly rejected and resented the request.

One Who Is Unchallenged

THERE were pending in the same court, however, numerous suits against a railroad company that had back of it the most powerful political influences in that section. The suits were for damages by fire in the same part of the state where the court was sitting and where we were to try our government case. The officials of the railroad naturally desired a jury coming from a different part of the state, remote from that part financially interested. Thus both the railroad and the Government wanted the jury taken from the section remote from the scene of the fire. But the Government's request was refused. However, when the railroad, in its own interest, made identically the same request, it was immediately granted. We both got what we wanted! An impartial jury was impaneled to try the case that I had in charge. We were successful. The attorney against us expressed his opinion that we won because we were traveling on the same train with the railroad magnate and were pulled along by his engine.

Some time after this occurrence a federal district judge was appointed in that state; and a friend asked me what I thought of the appointment. I told him that in my judgment the jury commission in that jurisdiction was not entirely free from certain influences interested in litigation in the Federal courts; that if the newly appointed judge changed the jury commission and put on it men whom the community felt were under no obligation to any special interest, I would have one opinion of the judge; but if he retained the jury commission as then constituted, I should have a different opinion.

When a case comes on for trial before a jury, the juror may be questioned as to his connections, interests, opinions, prejudices and any fact or circumstance calculated to prevent him from rendering an impartial verdict. The grounds of challenge for cause are many, and a certain number of jurors may be challenged without cause.

The judge, however, who presides over the trial and is the "thirteenth juror" can be neither questioned nor challenged. He may be under disabilities that would make it perfectly proper and legal to challenge him for cause if he were a juror in the box. But counsel for the litigant cannot challenge the judge, although he may be perfectly satisfied that the case should not be tried before that judge.

The jury is an integral part of the court, and its duty requires the exercise of intelligence and integrity. A juror is answerable only to his conscience and his God for the verdict that he renders on the evidence submitted. The independence of the jury is proclaimed in our law. The jury is the sole judge of the fact, but must, of course, take the law from the court. If a juror invades the province of the court and assumes the right to determine the law as distinguished from the facts, he is liable to censure, and if he expresses want of respect for the court, the jail door stands open for him upon commitment for contempt.

Judge Versus Jury

IT IS no unusual thing, however, to hear a judge, who insists with all the power of the office he holds that no contempt shall be shown him in his official position, give expression to ridicule and abuse evidencing his contempt for the jury whose verdict is in conflict with his opinion or desire. *The judge has no more right in law or morals to show contempt for the jury than have jurors to show contempt for the judge.*

The difference is, however, that the judge may imprison the juror, but the juror has no power to imprison the judge for his expression of contempt for jurors. The jurors leave the court with the feeling of the small boy whose father asked him if he knew why he had whipped him, and the little fellow replied, "Yes, because you are bigger than I am."

The juror must understand the evidence, and it is his duty to "look and listen," to apply his every faculty to the trial of the case and in doing so to exercise common sense and utilize the practical experience of life.

It is the duty of the presiding judge to aid and assist the jurors in understanding the evidence and with courtesy and patience help to make plain and simple the facts as testified to by the witness and in his charge to draw clear the line between the issues of fact that lie exclusively in the domain of the jury and the law applicable to that case, by which the jury must be controlled in rendering a verdict.

Jurors who refuse to take the law from the court are incipient anarchists. The judge who attempts to dominate and control the jury takes his place with destroyers of the law, and he can have only himself to thank if he sees growing disrespect for law.

Most judges seek to aid the jury in understanding the facts and they accord to the jurors the same consideration and respect in the performance of the duty laid on the jury that they expect for themselves in the performance of the duty the law places on the judge.

Seldom is a judge other than courteous and helpful to the jury; only the arrogant and contemptuous few reflect upon the bench by showing contempt for that portion of the court represented by the jury.

Some years ago I witnessed a trial in which the jurors asked many questions of the witnesses and thereby made clear certain important evidence that the questions of the attorneys had failed to bring out. The able, patient and impartial judge who presided encouraged the jurors in their efforts to understand the evidence and he followed the lead of the jurors in bringing out evidence that the questions of the jurors suggested. The case went to an appellate court on appeal, and one of the appellate judges in his opinion severely criticized the trial judge for permitting the jurors to ask questions of the witnesses. The opinion of the appellate judge, however, contained what purported to be a statement of facts upon which the judgment of reversal was rendered, which was in conflict with the facts as disclosed by the record.

The Only Safeguard

OPINIONS of appellate courts in which the "facts" are so stated as to sustain the judgment of the appellate court by misstatement of the facts as disclosed by the whole record, or by drawing strained and distorted inferences to justify the judgment that it has been determined to render, gives one a greater respect for the untechnical jurors who give language its everyday meaning and are governed by common sense and old-fashioned honesty in rendering their verdict.

The highly trained, technical mind is of value, of great value, but its very refinement and tendency to hairsplitting often makes it an unsafe guide in the practical affairs of life. The specialist diagnoses with a view to finding the particular thing in which he specializes.

The technical lawyer—the "case" judge—often unconsciously loses sight of justice and common honesty in dealing in and applying precedents that are moldy with age, the reason for which has been forgotten in the dim and distant past. Thus often the administration of law becomes a game in which shrewdness and rules of practice count for more than justice and integrity.

Jurors jump these hurdles where they can and apply common sense to the evidence. They get away from the "whereas" and the "aforesaids" and the specially devised jargon that is so often used to conceal the "niger in the woodpile." They want to know what it all means and render a verdict based on fact and justice between man and man and not on technical precedents "hoary with age" that have come down unchanged and unimproved from the time "whereof the memory of man runneth not to the contrary."

After an experience of more than thirty years in the active practice of the law, with more than ten years spent day after day in the trial of jury cases in both criminal and civil cases, I am satisfied, from observation and experience, that trial by jury has not outlived its usefulness and should be retained, purified and strengthened.

With all the defects of the jury system, after running the gauntlet of subsidized and hand-picked jury commissioners, trickery, corruption; personal, racial and religious influence, trial by jury provides machinery that comes nearer doing justice than trial by judge, and is practically the only safeguard that the average man has against the power of money.

Migration for Conscience' Sake

A CELEBRATION of importance to Canada and the United States alike recently took place in the little city of Belleville, Ontario, on the Bay of Quinte.

This was in commemoration of the arrival at Belleville one hundred and forty years ago of the loyalists who quitted the United States after the treaty of peace that terminated the Revolution. They effected what was termed the settlement of Upper Canada by the United Empire Loyalists. Upper Canada is now known as the Province of Ontario.

It was the pioneer, constructive spirit of the settlers of Belleville that wrought the present Dominion of Canada out of the then existing wilderness. More British than the British in their determination to establish a great colonial state in North America, these United Empire Loyalists finally aroused the languid mother country to co-operate in their efforts.

It is said that most of the present old families of Boston are really Salem people who replaced the large numbers of Bostonians who left with the British forces.

Business and Parades

THE striking American habit of parading upon Main Street is being forced into the discard by modern traffic and business conditions.

The Fifth Avenue Association no longer glories in having that thoroughfare used for the pageants of the metropolis. Exclusive establishments that have given the Avenue its vogue fear Park avenue and side streets will be preferred by the shopping public if parades are continually stopping things.

Other cities have gradually tightened the requirements for parades during business hours until one sees less and less of the old-time turnouts.

Handling the street traffic of the modern city has become as complicated a problem and as harassing a burden as dispatching railway traffic at the terminals. Parades demoralize all of this.

Furthermore, the hours of business in the central districts have become much shorter. Stores and office buildings are rented upon the basis of the traffic past their doors. Parades kill this profitable flow of patrons.

It is just as unfair to stifle downtown business and traffic for parades as it would be to force factories to close for parades and to have the railway terminals locked up until the bandwagon passed.

However, the new order of things, efficient though it may be, is less colorful and diverting than when the circus and minstrels and lodges of every sort paraded Main Street.

Siberia Rich in Potentialities

AMERICA, disgusted and repelled by the stupid and puerile propaganda of the Soviets, is perhaps too prone to overlook the potentialities of an empire that covers one-seventh of the world's surface.

Siberia is especially misunderstood because Keenan's classic book about the far northern convict settlements distorted our ideas of the climate and country in general. As a matter of fact, much of Siberia is as far south as Virginia and Kentucky. The principal interior cities and seaports have the same climate as our Great Lakes cities.

Continental United States without Alaska covers 2,811,520 square miles and we think it is a pretty big country. However, Siberia with its 5,493,629 square miles is almost twice as large and it does not have as much useless mountain and desert area as this country.

Siberia is a self-contained country as far as natural resources are concerned. With its fertile soil and temperate climate, Siberia will take care of future agricultural needs of humanity. It has the largest forests on earth, the American and Canadian forests being tiny in comparison.

There are immense hard coal deposits in Siberia and soft coal measures are distributed all over the whole country. The petroleum deposits are enormous, but the country has not been thoroughly explored for it. The iron fields of Siberia are of tremendous extent. Siberia has long been the world's source of platinum, and while producing gold, the possibilities have only been scratched.

No country on earth has such a system of giant rivers with navigable reaches longer than anything we know in America. While the nine-thousand-mile trans-Siberian railway makes the American and Canadian coast-to-coast routes seem quite short, the rivers provide a more striking comparison. Incidentally it will be easily possible to connect the headwaters of some of the rivers so vessels can proceed from the Mediterranean to the heart of Siberia.

The Ob River system has a navigable length of 16,869 miles and the Yenisei has a navigable length of 11,808 miles, including Lake Baikal which is as big as any of our Great Lakes. These two rivers have been joined, giving an east and west waterway from near the frontier of European Russia to the Chinese border, a distance of 3,650 miles. The Lena River is navigable for 6,864 miles. The Amur River, flowing from Central Siberia east to the Pacific, is navigable for 8,541 miles and has 20,000 miles of navigable tributaries.

Given a consistent government and effective leadership, the development of Siberia will be more resultful than any other land that remains to be pioneered.

Should Congressman's Pay Limit Scientist's?

THE last unexplored region of Uncle Sam's domain in North America and one of the few unknown places in the world has just been traversed by a party of United States Geological Survey experts. It is the northern marches of Alaska.

The exploring party, headed by Dr. Philip S. Smith, crossed the Elliott Mountain range in Northern Alaska last winter on snowshoes and dog sledges. They had to locate or discover passes across the range. It was virgin territory.

A letter written March 30 and brought back to civilization by an Eskimo states that in exploring the Colville River they discovered an hitherto unknown river two hundreds yards wide which flows westward and then turns northward.

The party plans to continue the river exploration, but it must reach the coast in time to catch the last ship out of the Arctic Ocean before the September freeze-up.

The party is exploring Naval Petroleum Reservation No. 4. The Arctic wild seems to be rich in petroleum. The party "went in" during the winter because much of the country they traversed is impassable swamp or muskeg, made unbearable by swarms of huge mosquitoes in the summer.

While the Geological Survey has discovered and charted much of the natural resources of the nation, and has also made the splendid topographic maps of much of the country, it is one of those services that are more or less starved by Congress because there is little political capital to be made out of interest in them.

While private industry has come to realize that exploration and research workers are its most valuable aids and is paying them accordingly, Congress is not disposed to pay any man of scientific attainments in excess of $7,500, the pay of a Congressman and thereby the dead line for almost every other government employe.

When Congress does grudgingly concede a salary in excess of $7,500, the receivers are usually the objects of surly and jealous treatment by Congressmen who resent anyone receiving more from the government than they do.

This is the age of the engineer and scientist and the path to national glory is for the United States Government to divert its spending to the support of such productive agencies.

Startling Facts About Silver Fox

THE silver fox business is facing deflation to the real pelt value of its product, something entirely different from the fantastic prices at which breeding stock is being sold.

Many reputable publications are declining high-pressure silver fox advertising as a result of examining the facts.

The claims that silver fox pelts can be sold for $1,000 each are demolished by the Bureau of Statistics of the Dominion of Canada which reports that the average price of silver fox pelts in 1919-1920 was $245.80; in 1920-1921, $152; in 1921-1922, $147 and in 1922-1923, $112.80.

A prominent American furrier has just stated that he believed the price for the very best pelts would not exceed $400 and that the average price would be about $150, running as low possibly, for defective skins, as fifty cents.

The high advertised values of silver fox pelts employed by those selling breeding stock to credulous people were established a generation or two ago when such pelts were natural rarities occasionally taken in the wilderness by fortunate trappers.

However, there are now more than 40,000 silver foxes in captivity in the United States and also a very large number in Canada. Standardization of feeding methods and disease prevention will increase this number steadily. Their pelts are becoming a staple product instead of a specialty. They are having to be marketed under the highly competitive conditions that volume production brings about. The official Canadian figures show the steady decline in prices, as numbers have increased.

The public should not be deceived by specious claims that the United States Government endorses the silver fox industry. The Biological Survey of the Department of Agriculture officially disclaims that it endorses this or any other industry.

The Biological Survey also makes the following ominous statement that should arouse those who believe the high prices of silver foxes sold for breeding purposes can be maintained in the presence of the above prices of pelts and the 40,000 foxes in captivity in the United States alone:

"It must not be overlooked that the sole purpose of growing fur-bearing animals is to sell the pelts. The sale of breeding stock is only incidental. When the main purpose of raising fur-bearing animals is lost sight of, that is to produce salable pelts, the business loses its economic basis for existence."

Now that real values will have to be established on the basis of pelt sales the silver fox business may become stabilized, but not at frequently advertised prices.

The Decrease Did Not Continue

A YEAR ago, when the Treasury Department began its crusade against the so-called tax-exempt securities, the decreasing amount of income being derived from surtaxes was pointed out as evidence of excessive investment in such securities to the detriment of taxable income. It will be remembered the comparisons ended with the receipts on this account for 1921, the comparison beginning with 1918.

No mention was made that the totals included the years of idleness in industry, which must have accounted for a part, at least, of the decrease.

The utter worthlessness of the comparison is shown in a report of the Treasury Department, published July 7, announcing an enormous increase in income tax receipts for the calender year 1922. As was predicted by those who were not carried into the ranks of believers in everything emanating from official Washington, the result shown was such as to put a quietus on the argument attempted. Not only was the course of surtax receipts no longer downward, but there was as in other branches of the complicated rates, a large increase in totals.

It is to be hoped the tax-exempt bond bogey is banished forever. It was only a cover for other evasions of taxes.

No party ever won an election because of a platform built to suit everybody. Neither is abuse of opponents a means of attracting votes. A short, earnest declaration of vital principles, without verbose discussion, will carry more weight.

Terence V. Powderly is dead. Thirty years or more ago this announcement would have caused genuine sorrow among millions, but today few will remember the power he exerted. For Terence V. Powderly was once the most powerful labor leader in the world.

How Patrick Henry Helped Save the Northwest

Letter of Instruction Found in Draper Collection

By FRED L. HOLMES

PATRICK HENRY didn't die soon after he delivered that speech before the Virginia House of Burgesses about "give me liberty or give me death." Such a notion, prevalent though it may be, is untrue. Historians have been so busy retouching the coloring in the picture of his oratorical outburst, that his other dramatic achievements have been dimmed. Recently another epoch in the life of the fiery zealot for American liberty has been disclosed. One of his old letters was brought forth. The paper was a little yellowed, but the writing was as legible as if it were penned yesterday. It foreshadowed one more blow for freedom.

As governor of Virginia, during the Revolutionary War, Henry had given a memorandum of instruction to a Kentucky frontiersman. It was this authority which placed George Rogers Clark in the role of the most brilliant figure in the old Northwest during the fight for independence. Accomplishments under it wrested the basin above the Ohio River from the British by a dashing military campaign.

When it came to writing the terms of recognition and peace at Paris, in 1783, Franklin argued that possession counted nine-tenths. His logic couldn't be met. As a result, the sweep of country north of the Ohio River, divided later into the states of Ohio, Indiana, Michigan, Illinois and Wisconsin, became part of the United States. George Rogers Clark made it possible.

Most of us know little about him. Some confuse him with the expedition made by his brother across the continent in 1804. But George has a niche of his own, and to the people who live in the old Northwest it should be an important one.

Louisville, Kentucky, claims him as its founder. That alone would be sufficient recognition for any man. But to him it was a mere milestone in his long and brilliant military adventure. Corn Island, in the Ohio River and the locality about the rumbling "falls," where Louisville stands, was the base of his strategic operations. From here he maneuvered the military campaign that brought results.

The people of Virginia had a selfish interest in the Ohio Valley. They claimed that the original grant from the King gave a slice of land extending to the Mississippi River. Many were already moving over the mountains and adventurous surveyors were platting and entering blocks of the fertile lands. Among them was Clark. So it came as no surprise that Virginia should place a monument to the "Conqueror of the Northwest" on its campus at Charlottesville. She was only honoring one of her wandering sons.

"Clark was born in 1752 just over the hill beyond Monticello," said a professor at the University of Virginia in explaining the appropriateness of the cenotaph. "The farms of Thomas Jefferson's and George Rogers Clark's fathers joined."

"Was Clark a playmate of Jefferson in boyhood?" was asked.

"That is doubtful. The Clarks moved away from the community when George was five years of age. They went to the headwaters of the York to live. George was given only meager schooling. For about nine months he was instructed by Donald Robertson, under whom James Madison, afterward President of the United States, studied at about the same time."

"Some of his letters on file in the Draper Collection at the State Historical Library of Wisconsin would indicate he was a bad speller," came the interruption.

"That is true," he rejoined with a smile. "Clark was never very careful about his letters. He was proficient in mathematics, however, and, like Washington, was a prominent surveyor in his time. It is a singular fact that many of the men of that period, who became surveyors of the empire west of the Alleghanies, also became the first men of the land. Surveying was then recognized as an important profession."

"Just why was the place of a pioneer surveyor so important in developing leadership?"

"All of the experiences of the frontiersmen and soldiers came to the surveyors," he responded. "They were the pathfinders into the unsettled country. They dealt with the Indians and came to know their trails, habits, hunting grounds, the route of rivers and where the best fishing was to be found. They experienced the hardships of flood and famine, learned the stealth of Indians and were taught the role of heroism which must be played when danger threatened. They found the easy ways into the new country, and when the time came to defend it against an enemy or wrench it from an intruder, they had the information upon which to base a successful campaign. The surveying experience of George Rogers Clark paved the way to his greatness. It gave him the knowledge of country and frontier experience by which he was enabled to conduct his military campaign."

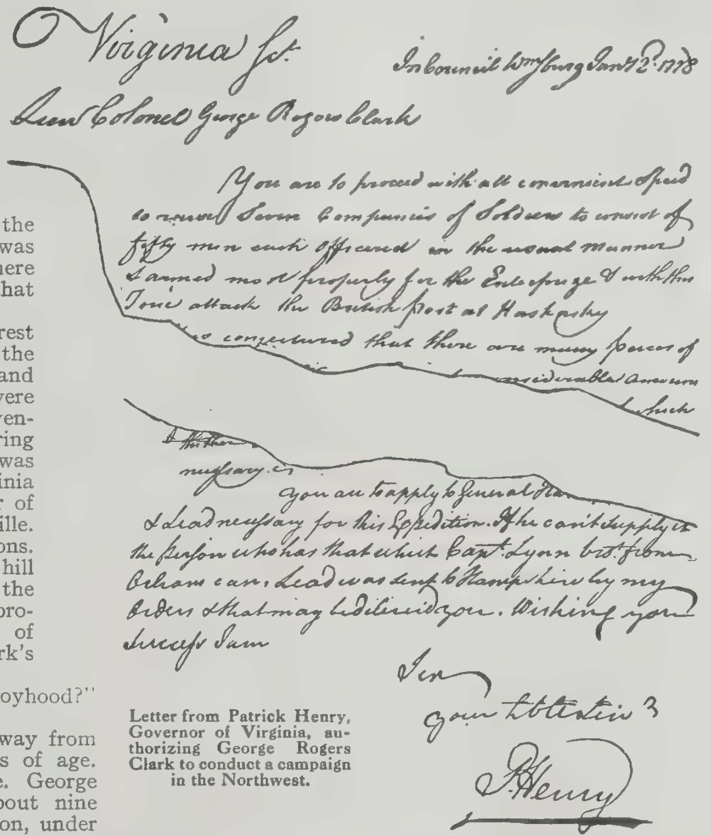
Clark went early into the Boone's Kentucky country to survey. He seems to have got around a great deal. He saw service in Lord Dunmore's war, but in 1775 returned to the West to resume his work.

"I have engaged," he wrote to his brother Jonathan from Stewart's Crossing, "as a deputy surveyor under Cap'n. Hancock Lee, for to lay out lands on ye Kentuck, for ye Ohio company, at ye rate of 80 pounds pr. year, and ye privilege of taking what land I want."

Clark was of powerful physique. He was full six feet in height, stout of frame and was possessed of "red hair, and a black, penetrating, sparkling eye." He was bold, courageous and resourceful. He liked to be achieving. His ambitions prompted him to use the settlements of Kentucky as a base from which to conquer the vast region to the north.

Between the Ohio River and the Great Lakes, the Mississippi and the Alleghanies, was the seat of powerful, warlike Indian confederacies. With them the Kentuckians desired peace. Generations before the coming of Boone, the French had made a few settlements above the Ohio, which, with the defeat of the French, had been taken over by the British, by the treaty of 1763. Among them were Detroit, Mackinac, Vincennes, Kaskaskia and Cahokia. By far the most important of these was the British post at Detroit, numbering upward of 2,000 souls, with a garrisoned post of 300 men commanded by Lieutenant Governor Henry Hamilton. He was brave and bold as a soldier, but unscrupulous in methods for inciting the Indians. Backwoodsmen called him the "hair-buying general," claiming that he urged the savages to take scalps. The merit of this opprobrious epithet seems now a little doubtful.

After the breath of the American Revolution swept over the country, Hamilton summoned the Indians to Detroit and early in 1777 they began crossing the Ohio River to make war on the Kentucky settlements. The attack had been so continuous, that by the close of the year less than 600 remained. The British planned to hold this great fur-producing country.



Virginia Sct.

In Council Wmsburg Jany 2d 1778

Lieut Colonel George Rogers Clark

You are to proceed with all convenient Speed to raise Seven Companies of Soldiers to consist of fifty men each officered in the usual Manner & armed most properly for the Enterprize & with this Force attack the British post at Kaskasky

...s conjectured that there are many pieces of ... considerable amount ... such

... further ... necessary ...

You are to apply to General Han...

& Lead necessary for this Expedition. If he cant supply it the Person who has that which Capt. Lynn brot. from Orleans can. Lead was sent to Hampshire by my Orders & that may be delivered you. Wishing you Success I am

Sir

your hble Servt

P. Henry

Letter from Patrick Henry, Governor of Virginia, authorizing George Rogers Clark to conduct a campaign in the Northwest.

Confronted by this menace, Clark executed his first plan of leadership. He sent spies into the Illinois country and soon learned that the populations about the forts were not interested in the contest of the seaboard colonies for independence. Neither were they particularly friendly to the British, but were awed by the bravery of the Kentucky militiamen. These long-haired fighters were to be feared. With this information Clark felt they would not espouse the English cause. Foreseeing they might take no active part and that recruits could not be raised among them, Clark returned to Virginia. In August, 1777, he consulted with Patrick Henry, the governor of the colony, regarding a plan for capturing the British posts north of the Ohio. The adventurous Virginia patriot took Clark at his word. He endorsed his plan.

"Conqueror of the Northwest." Statue of George Rogers Clark on the campus of the University of Virginia, about two miles from Clark's birthplace.

GEORGE ROGERS CLARK

To cloak the real designs, the Virginia Legislature extended financial aid and authorized the raising of volunteers on the plea that the venture was designed for the protection of Kentuckians. They were being harassed by the Indians. Clark was lieutenant colonel, January 2, 1778. On that date, Patrick Henry gave him a letter of instruction, which has since been found in the collection of old manuscripts gathered seventy-five years ago by Lyman Draper for the purpose of writing the history of Clark and the period. Draper procrastinated in his labors until he became an old man, and the legacy of sixty-five volumes of original papers and manuscripts became the core of the great collection of the Wisconsin Historical Society, now annually studied by scores of scholars and historians.

Judged from this letter, Henry's soul was fired with enthusiasm. He authorized Clark to raise "seven companies each of fifty men" which were to act as a militia. Virginia gave him official encouragement. But the whole burden of making the expedition was laid on Clark's shoulders. He was to raise the men, command them, lead them were he wanted. The glory of his achievements belongs to him alone.

Difficulties were encountered in raising troops on the frontier. There was jealousy between the people of Pennsylvania and Virginia over the occupancy of the West. Discouragements were daily events. It was May before 150 had been mustered. Rough, unlettered, with no semblance of military uniforms, wearing the conventional dress of Indian moccasins, homespun or buckskin breeches and shirt; with a fringe of leather thongs down each outer seam of the legs, these frontier-soldiers presented an odd picture. About the waist was a leather girdle from which dangled a long knife. Over one hip was a well scraped and polished powderhorn and on the other a leather sack for carrying game or provisions. Some of the soldiers wore hats of felt, others caps of squirrel-skin. On each man's shoulder rested a heavy, clumsy flintlock rifle.

Flat boats were used on the way down the Ohio until "the falls" were reached, May 27, 1776. This was a portage that required unloading for both descending and ascending, and Clark picked the spot as ideal for a military base. Here, within sound of the chattering rapids visited by La Salle more than one hundred years before, a part of his company built a blockhouse and planted a crop of corn on an island. Later this settlement was moved to the mainland and became the site of Louisville, named for Louis, the King of France, who ultimately cast his influence with the fighting Americans.

The capture of Kaskaskia and Cahokia on the Mississippi River was desired first. The settlers about these forts were French and were expected to be lukewarm to the peril of the British. Descending the river to about the site of the present Paducah, Clark and his men struck across country some one hundred and twenty miles, guided by an American hunter who was familiar with the French settlements. Kaskaskia was reached on the evening of July 4.

One of those dances popular on the frontier was in progress. Some of the historians give the scene of Clark's coming a picturesque setting. It is claimed that Clark secured entrance to the place and had been watching the dancing a long time when his presence was detected by an Indian. He sounded the war-whoop too late. Clark's men had surrounded the place.

"Go on with the dance," ordered Clark as he stood at the hall entrance, his arms folded. The picture of this moment has since been given an idealistic portrayal by an eastern artist.

"Be pleased to remember, however, that you are now holding revelry under the banner of Virginia and not under that of Great Britain," he added.

"In fifteen minutes we were masters of the place, without the firing of a gun," wrote Clark in his official report.

At daylight the soldiers and people were disarmed.

(Concluded on page 14)

The Lure of the Trail

For Real Thrill and Adventure Leave Your Auto Behind and Take to the Mountain Paths

By GRACE E. EASTERDAY

Trees felled across the streams by the rangers are the bridges you find in Glacier Park.

A COOL, clear morning in the early part of July—a stillness so intense we were conscious of it—mountain peaks rising in calm sublimity against a cloudless sky; it was these that caught and held our attention, for it was to lose ourselves in their fastnesses that we had journeyed far.

Some years before we had been told of this place with trails leading through the mountains—trails leading on and on, ever through new scenes and amid a wilderness as primitive as though man had never set foot in it, yet trails so accessible that anyone could follow them afoot, and so convenient that always at the end of the day food, shelter and every convenience would be found.

Glacier Park is one of the newest of our national parks. It is noted for its many glaciers and beautiful lakes. The sheer, rugged type of its mountains, the peculiar Lewis Overthrust, where the oldest stratum of rock is found on top of the mountain and the newest stratum at the bottom, make it distinctive. It covers so large an area that it is not overrun by the tourist—a turn of the trail and you are alone amid a vast solitude. The hand of civilization has reached far but here nature itself has put up a barrier which makes intrusion difficult.

There are two entrances to the park; one on the east side at Glacier Park and the other on the west side at Belton. Automobile roads, smooth as boulevards, skirt the park with spurs running to Two Medicine Lake and Cut Bank, but if you would really know and see its grandeur you must take the trails, either horseback or afoot, which lead into the very heart of it. Nowhere are there trails which offer such complete variety as these and they are so arranged you may go in at one entrance and leave at the other without retracing your steps. Wading through icy streams, drenched to the skin by rain, crossing fields of snow, looking down from dizzy heights, the quiet of some sheltered valley, wild flowers in profusion, unexpected thrills, an awe that overwhelmed—such were our experiences as we followed along these trails. We covered one hundred and fifty miles and when we counted the pictures we had snapped along the way we had just one hundred and fifty—a picture for every mile.

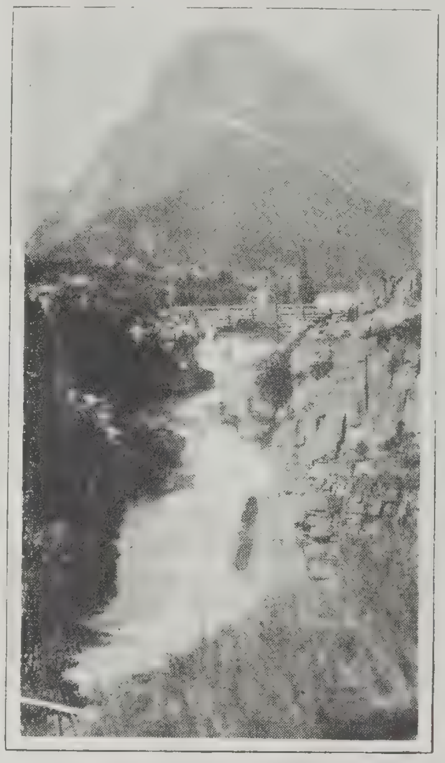
We entered at Glacier Park on the east side the tenth day of July and it was well we entered there instead of at Belton, the western entrance, for the seasons are late in these mountains and the trails to Sperry were not opened until several days later. We went by way of Two Medicine Lake, thence to Cut Bank, St. Mary's, Going-to-the-Sun, Many Glacier, Granite Park, back to Going-to-the-Sun over Logan Pass, then over Gunsight Pass and Lincoln Divide to Sperry. Except the Triple Divide trail, which was not open and which we hesitated to attempt after our experience in reaching Cut Bank over a trail not yet officially opened, we followed all the principal trails in the park, crossing the Continental Divide three times.

There were two of us and we went afoot without a guide or other company. We wanted to loiter on the way, to stop when the mood caught us, to enjoy each passing scene as fancy dictated. We were tired. We wanted to go some place where we could forget and relax, some place where we could shake off the fetters of our complex civilization and lose ourselves amid nature's wonders. We were tenderfeet, but there was strong within us the call of those mountain trails which led on and on. Clad in khaki and stout walking shoes, with sweaters and knapsacks holding a few toilet articles and other necessities, we were ready for our great adventure.

The trail to Two Medicine Lake led over Mt. Henry's barren summit, a mountain formed as though some giant had snatched up a bit of mother earth and tipped it at an angle. The ascent began abruptly and as abruptly timberline was passed, the last lone tree with branches flung in one direction stood in utter defiance of the elements, gnarled, weather-beaten and distorted—mute evidence of its own tenacity. To the right far below Lower Two Medicine Lake shimmered in the sunlight. Across from Mt. Henry's summit towered Rising Wolf, a mighty mass of rock, impressive, stupendous. Snow still lay on the trail, treacherous for the unwary foot as it sloped precipitously toward a deep chasm. As we began the descent into Two Medicine Valley we could see Two Medicine Lake stretched like a silver ribbon far below, the chalets nestled close to Rising Wolf's protecting massiveness. When the lake was reached, Mt. Rockwell, rising in stately symmetry from the water's edge, with fir and cedar trees spread along the shore in fringe-like effect, made a wonderful picture.

Before starting to Cut Bank the next morning we commented on the beauty of the lake and mountains to the girl in the hotel office. "Yes," she replied, "it is a beautiful spot but you would be surprised at the number of people who drive up here in the transportation cars and instead of enjoying the scenery write post cards to the folks back home until time to ride on to the next stop. And they think they are seeing the park."

To Cut Bank Chalets over a trail the ranger had not yet officially opened was an experience both thrilling and unique. We might have hesitated had we known what was before us but the trail led through such grandeur, the scenery was so varied, it will always stand preeminent among the trails we followed that summer. First we crossed a burned-over area where the gaunt, blackened stumps of trees told of the tragedy which had happened here; then a forest was entered. So dense was it, the sun's rays failed to penetrate. The snow was packed hard and the trail was followed by the blazed trees. Not a sound disturbed the silence. Suddenly emerging from the forest we looked down upon a scene so lovely it held us spellbound for a moment. Ages ago some mighty glacier had hollowed out a perfect cirque in the side of the mountains and at the foot of a sheer precipice was a lake with waters of deepest blue. Above, clinging to the side of the precipice, a bank of snow fed the lake below and extending back from the water's edge were many trees looking much like a tiny park. So entrancing was the sight we were loth to leave it, but the trail urged us on. Reaching Cut Bank Pass we found ourselves on a narrow spur of mountain. To our left and far below was the lake we had just passed while to our right hundreds of feet below was another lake sheltered at the foot of another mountain cirque, the ice floating on its surface blue as the sky above from the reflected blue of the water. The trail now led through a canyon-like valley which narrowed as it went on. The season was late. There had been heavy snows the winter before and they were disappearing fast before the summer's sun. Tiny rivulets, in their haste to join Cut Bank Creek, used the trail as the easiest way to reach their destination. On both sides water was falling from the tops of the mountains where away out of sight some huge bank of snow or glacier lay concealed, and as it tumbled to the depths below formed graceful slender waterfalls.



Grinnell Mountain and McDermott Falls.

As we drew closer to Cut Bank Chalets the streams grew deeper and wider and then we found what it meant to go over a trail not officially opened. Trees felled across the streams by the rangers are the bridges you find in this wilderness. The trees and brush felled by the winter's storms obstructed the paths but the spring freshets had washed away or covered the trees felled by the ranger the summer before and it was necessary to wade these streams to continue on the trip.

Imagine wading an icy-cold stream, the water up to the thighs in depth and rushing swiftly over smooth, slippery stones—water so cold it took the breath. By the aid of a fallen sapling the first stream was safely crossed. After the third stream was crossed in like manner the sound of gurgling water struck a chill to the very soul. We knew another stream would have to be waded through. In close succession five turbulent mountain streams were forded. There was one stream deeper and wider than the rest. Over this was felled a huge tree but its rounding surface offered no sure foothold so we crawled across. With knapsacks and camera it was no easy task.

Far in the distance a bit of roof could be seen through the trees. Surely it could never be reached by dark. We had a few matches but not even a piece of candle, which should always be included in the equipment when hiking through the mountains as it is the greatest help in lighting fires and saves matches. What wild animals would be lurking about after dark? It would be cold as soon as the sun went down and we had no blankets for protection. We began to feel that we were indeed in a predicament. However, the long twilight was in our favor and without any warning of their nearness we found ourselves almost beside the chalets about eight o'clock. The three young men who had preceded us that day over the same trail were lined up on the opposite side of Cut Bank Creek watching for us, wondering if we would reach our destination that night, and the kindly couple in charge of the chalets prepared a warm supper for us and dried our wet clothing during the night. For all the discomfort of the day before, we arose the next morning, fresh and rested, eager for the trail ahead. There was something about this wonderful, rugged mountain country that was gripping us fast.

The lure of the trail ahead! Have you ever felt it? If you haven't, go out and follow the mountain trails and your soul will be reborn. The omnipotence of some higher power overwhelms. Your insignificance in the

(C) Hileman, Kalispell, Mont.

East from Alpine Park.

scheme of things humbles. Cut Bank is a quiet, restful spot. It is used principally as an overnight stopping place by those who are on their way to Two Medicine Lake or the Triple Divide. Fishing parties come here, too, to angle for the gamy trout found in the clear pools.

St. Mary's Lake was crossed on a launch. Going-to-the-Sun mountain viewed from a distance, a patch of snow gleaming high up on its crevassed side, was a most impressive sight. It seemed to hold itself aloof as though something quite apart from the jumble of peaks surrounding it. There was a group of buildings at the foot of this mountain clustered on a point of high land jutting far out into the lake and from their balconies we could see the hanging valley with Little Chief, Citadel, Reynolds and Fusilade mountains encircling the lake as they rose from the water's edge, a marvelous array of scenery. Here was a bit of Switzerland in our own Rocky Mountains.

It was at Going-to-the-Sun we met the guide who was born in Nebraska but grew up among the mountains. He had visited the place of his birth some time before but the mountains drew him back. He couldn't enjoy a country "where you could see where you were going before you got there." The lure of the trail! It held him fast! Here, also, we saw the porcupines. Slow, deliberate, they were harmless appearing creatures as we caught a glimpse of them among the trees. The girl from Chicago wanted some evidence of their mode of defense and chose her hat as the most convenient weapon of attack. However, curiosity quickly turned to consternation as her hat moved hurriedly toward the thick underbrush firmly impaled on the bristling quills of the porcupine's back and she might have continued through the park minus hat had it not been for an alert guide. Nevertheless the handful of quills left clinging to the rescued hat were sufficient proof of their ability to protect themselves against their enemies.

Many years ago, so the Indians tell the story, the Sun Father sent Sour Spirit to the Piegans and Blackfeet to teach them all the useful arts and how to make bows and arrows with which to kill buffalo, deer and elk that they would be sure of plenty of food. After a long stay with these tribes he was called back to his father in the sun, but that his teachings might never be forgotten his image was placed high on the side of the mountain as a constant reminder of his work, and today the patch of perpetual snow which resembles an Indian head with a war bonnet on, may still be seen. Ever since the Indians have called it "The-mountain-with-the-face-of-Sour-Spirit-who-has-gone-back-to-the-Sun."

As we followed the trail to Piegan Pass we went through flower-decked meadows where yellow violets, yellow columbine and yellow dogtooth violets ran riot. There were flowers of other hues but yellow predominated at this season of the year. And wonder of it all, we didn't have to stop, look and listen as we walked along in their midst. In this quiet, secluded spot we could stop at will with never a thought of some on-rushing traffic. The grassy spot beside a mountain stream where we ate our lunch made our simple fare seem food fit for the gods, and water flowing from some glacial source which we drank was nectar indeed.

Falls on the way to Iceberg Lake.

Just before the pass was reached the trail led across the side of a shale-covered mountain, stretching as far as eye could see with not a shrub or tree to break the monotony of its course. We had to step to the side of this trail to let a horseback party pass. The trail was narrow with a steep descent on one side. There was barely room for horse and rider and ourselves clinging to the rocky side of the mountain. The last rider, as he passed us, wearied from his unaccustomed mode of travel, looked at us longingly and exclaimed, "I wish I were walking, too."

At Piegan Pass we found ourselves in the wildest sort of wind-swept country. We could see Blackfeet Glacier away in the distance dazzling in the sunlight. In front was the Garden Wall and on every side rugged, snow-capped, precipitous mountains. We were infinitesimal specks among this colossal handiwork of nature.

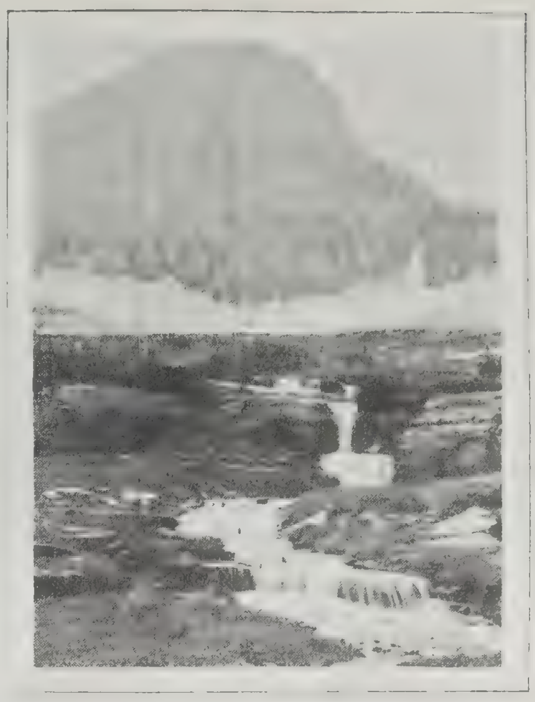
The reflections in Lake McDermott were wonderful. It was difficult to discover which was top and which was bottom of the pictures taken here, so perfect were the mirrored mountains on the water's surface. On the shore of Lake McDermott is the Many Glacier Hotel. Of Alpine architecture, it is built entirely of native stone and timber. Looking across Lake McDermott from the hotel you see the Continental Divide. There are found the Garden Wall, Gould and Grinnell mountains with an ever-changing panorama of sunlight and shadow to glorify them.

Iceberg Lake is a miniature polar sea transplanted for our enjoyment. Always filled with tiny floating icebergs formed by broken pieces of ice from the glacier at its head, it is a wonder spot to all who see it.

A trail leading up the precipitous side of a mountain, making numerous switch-backs in its ascent, forms part of the Swift Current trail. When the highest point is reached, look back and down over the Swift Current valley, Lake McDermott and the Sherburne Lakes and say the climb was not worth the effort! Winding about at a dizzy height the trail reaches Swift Current Pass where a view bursts into sight that thrills with a feeling of deepest awe. Heavens Peak, snow covered, stands out from the range of mountain peaks which stretches north as far as eye can see. It towers high above the green verdure of a deep, tree-filled valley as if it were a connecting link between the material and the spiritual.

Granite chalets are perched upon a rocky promontory overlooking the McDonald valley filled with magnificent timber and the Livingston Range beyond, while wild flowers blossom in undisturbed profusion in the meadows round about. In the afternoon there was a flurry of snow and as the clouds drifted away the setting sun was reflected in the east. It was as though two suns were setting in the heavens, slipping into oblivion behind the mountain ranges on either side of us.

The trail over Logan Pass followed close to the top of the Garden Wall for miles and we looked down into the broad, sweeping valley beyond which lay Lake McDonald. We quenched our thirst from the water flowing over the mountain top. We crossed a snow field of huge proportions undisturbed by sun and heat. A whistling marmot darted back and forth along the trail and we followed back some distance before he stayed from behind the shelter of the protecting rocks long enough for us to snap his picture. Then, with the click of the camera, he darted out of sight.



(C) Hileman, Kalispell, Mont.

Mount Reynolds and Cascades.

Gunsight trail loomed before us as the trail most difficult to make. Following sheer heights, paths covered by long stretches of snow, we dreaded, yet longed to make it. Perhaps because it was next to the last trail we were to follow, and the trails were not so strange to us by this time, it proved the most glorious trip of all. The trail led up the steep slopes of Mt. Jackson, whose rugged sheerness compelled our deepest admiration. The snow-filled path on the steep side of the mountain, leveled only sufficiently to provide a safe foothold, the rugged peaks on every side, Gunsight Lake stretching long and narrow hundreds of feet below. It was a fitting climax to an experience the like of which we had never had before.

Arriving at Gunsight Pass, Lake Ellen Wilson, one of the loveliest lakes in the park, could be seen in the distance far down at the foot of the winding trail. We skirted this lake, then climbed to Lincoln Divide, descending to Sperry on the opposite side of the mountain. The Sperry Chalets are on a small plateau with a rocky wall at the rear and a precipitous descent of some 3,000 feet in front which gives a wonderful view of valley and forest. The chalets were like a gem in an elaborate setting as we viewed them from the Divide and the forests beyond were a contrast to the mountainous country we were leaving.

That evening at Sperry we were sitting about after the evening meal, viewing the heights descended a few hours before. A heavy cloud lay back of the mountain tops and the setting sun shining upon it made it a dusky hue. A large white mountain goat strolled out on an upper ledge and stood silhouetted against the inky background, proud, erect, motionless. He stood there unaware of the watchful crowd below; then, his contemplations over, gracefully leaped to a grassy meadow below and browsed about in quiet content.

To Lake McDonald from Sperry the trail led down through a quiet, restful forest and we tarried on the way, loathe to leave the trails we had traveled these many days. Lake McDonald, the largest of all the lakes we had seen, is surrounded by heavy timber and mountains. Crossing the lake on a launch we arrived at Belton after a short walk through a lovely wood. It was the end of the trail.

We had felt the fatigue that follows a day of strenuous activity. Muscles long unused rebelled at the demands made upon them, but always after a restful night's sleep we had felt as fresh and fit as on the day we started. What we had done anyone with sufficient enthusiasm, perseverance and ordinary endurance can do without previous experience or preparation. We had sought rest and relaxation and had been rewarded by finding a grandeur unsurpassed, a repose of spirit beyond description.

That night as we waited at Belton for the train to carry us back to the heat and turmoil of the city, we watched a storm raging back in the mountains we had just left. A flash of lightning—a tree set afire—a red glare, then the rain quenching the blaze, a thin white pillar of smoke rose heavenward. Another flash! Another blaze flared up. Our train arrived and as we moved eastward the blaze far up in the mountains seemed like a signal beckoning us back to that land of wilderness where the trails lead on and on.

Seeing America first is a large order. The national parks set aside for our enjoyment are varied and impressive. They are every one worth seeing, but if you love the great outdoors, if the affairs of everyday life are weighing heavily, go out to Glacier Park and follow the trails. There you will find peace and contentment and a new inspiration in the lure of the trail ahead.

It is nature's great wonderland where mountain and lake and stately tree combine to delight the eye; where foaming waterfalls are born of the ice-clad mountain peaks to be swallowed up in the crystal sheets of shimmering splendor far below; where there is no disturbing influence to mar that feeling of tranquillity which is only found in such a sublime environment, and where new sources of pleasure unfold themselves at every step.

It is in a part of the great world such as this, where every treasure that nature can furnish is unfolded to the eye, that one realizes there is no need to go abroad in search of the sublime and the beautiful when such can be found without traveling beyond the bounds of the continent. There is no occasion to go to Switzerland, or the Austrian Tyrol, or the Windemere district of England, when scenes combining all their charm are to be so easily reached.

(C) Hileman, Kalispell, Mont

Many such scenes of grandeur and solitude are to be found in the glacier region.

Who's to Blame for the High Cost of Housing?

The Home Buyer Sometimes Finds It Hard to Make a Good Buy

By JOHN M. ROBERTSON

RESIDENTS of rapidly expanding industrial centers of the Middle West are paying heavily for greedy speculation in housing finance.

The result is a tendency toward the Murphy bed, the combined living room, bedroom and kitchenette, and the displacement of the front porch and the yard as characteristics of the American home.

In cities famous for good wages and steady employment, Cleveland and Detroit, for example, there is enforced substitution of tenancy in apartments for the old-time individual home ownership. And the American spirit does not flourish in tenements, regardless of the colorful names under which they are disguised.

Here are the outstanding reasons for so many people being forced to pay extortionate rentals and purchase prices for housing:

The toll exacted by shady financial discount companies dealing in "land contracts";

Inflation fostered by speculative mortgage-bond houses;

Commissions paid armies of high-tension salesmen whose extraction of money from the public through misrepresentation enables a whole chain of parasites to continue gouging the people.

Building material and labor costs cannot be blamed for the trouble. Propaganda which distorts the relations of these elements to high rents, serves only to shield the real culprits.

Fixing Rentals and Prices

UNDER present conditions it seems useless for big employers, who determine the wage scales in their respective districts, to try to help their people by raising wages. Their best efforts are immediately offset by house rents and sales prices being pegged a notch higher.

Tenants and home buyers are not the only ones who have been victimized by the practices of the house finance business.

Hundreds of thousands of persons in the opulent Middle West have lost at least half a billion dollars invested in the stocks of finance companies that discount land contracts and other installment pledges. The funds of these companies are often used to purchase the speculative paper or frozen assets of the promoters who have organized and dominate the finance companies. Without these wasteful and sometimes criminally managed companies it would be difficult for the structure of tenant and house buyer exploitation to stand.

Here is the way they take the home buyer down the line, and house rentals are based upon these figures:

The $7,500 five-room semi-bungalow, and upon an unpaved street, built upon a 35x110-foot lot is a favorite bait for the home buyer who responds to the cry, "Why Pay Rent?" These houses are also rented at from $75 a month up—usually *up*.

This "$7,500 house" represents these tangible assets: a $1.000 lot; a $3,600 house and the contractor's fair profit of $700—or $5,000 in all. It is sold on a basis of $800 down and $60 a month payments for fifteen or sixteen years.

Here is how the seller obtains more quick cash out of the sale and what it costs him although the house buyer foots the bill: First he gets $2,500 by placing a first mortgage upon the property since he holds title until the final installment is paid by the purchaser. The purchaser's signed agreement to pay $6,700, the difference between the sale price of $7.500 and the $800 cash down payment is known as a land contract. The seller takes this land contract to persons or companies who purchase them and sells it for thirty per cent less than its face value, sometimes more. Thirty per cent would mean wiping out $2.100 so far as the seller was concerned but the buyer would have to pay the full face value to the Shylock who bought the land contract. Then the contractor who usually has to take part of his pay in land contracts or second mortgages raises his normal profit to offset the risk of getting his money out of the paper payment.

A Cozy Four-Room Cottage—

THE purchaser will spend the first four or five years paying off the land contract discount figure before he begins to cover the intrinsic worth or resale value of the place. This penalty is avoided by the fortunate people who purchase their homes through the legitimate building and loan associations.

Then there are the garage houses, thousands of which are being unloaded on "home" buyers in the big cities. This is a 20x22-foot, one-story, four-room shell without a basement, sink, bath or toilet in the house. It rests upon concrete block corners with four-inch concrete veneer between them. The streets are merely cinderized roads.

These garage houses sell for $3,150 with a down payment of $250 and $30 monthly for eleven years and eight months. The building is hardly worth $1,200 and the "acreage" lot is high at $350.

Miles of duplex houses, a four-family brick veneer building, six rooms to a family, are being sold as "investments." They consist of a house costing about $13,500 erected on a $2,500 lot sold for about $25,000 with a $5.000 down payment and $200 a month. Here again one sees the cost of discounting land contracts.

Some promoters excuse their methods by claiming that larger down payments are required to merit fairer terms. As a matter of fact, they would be broken-hearted if present abuses were eliminated. They can thrive only upon the succession of discounts, commissions and inflation. The man with a larger down payment merely pays the ruling scale and gets rid of his money faster.

The capital of the finance companies that discount land contracts is obtained by selling eight to twelve per cent stock to the public through high-tension salesmen, the promotion expense usually being about thirty per cent.

Dividends are paid by these finance companies just as long as the public will buy more of their stocks. The dividends are frequently based upon the paper profits from the discounted land contracts purchased with their capital rather than actual earnings. Since no discrimination is employed in the quality of land contracts discounted and frequently the officers of the companies unload their own frozen assets or paper upon the company, it is not long before the capital is dried up and the stockholders are out of luck.

Sometimes a sagging finance company is "sold" to a new finance corporation dominated by the same crowd. They can well afford to pay the old stockholders a little for their discredited stock since it may be carried on the books of the new company at a higher value which establishes paper profits to cover up more skulduggery of the insiders. Sometimes the executives of these finance companies pay themselves huge bonuses for getting loans for the company, the clients usually being their personal house operations.

The stocks of the finance companies are sold upon the representation that their discounting is a form of banking and just as safe and profitable. One outfit has got hold of an old charter bearing the magic words, "trust company." It expects to sell its stock with less resistance from the sucker lists.

There are few or no prosecutions or even stockholders' suits arising out of the gutting of these discount companies. Ordinary stockholders do not have the means and experience to protect themselves. The other stockholders have usually participated in deals with the company that prevent them from appearing in court with clean hands.

Some people may wonder why there have not been drastic grand jury investigations of the dubious operations of these finance companies which are denounced by every reputable man who is acquainted with them. *It is illuminating to be informed that in one large city where a large number of these companies operate, practically every trial judge in the state courts is a director in some one of them.*

How the Mortgage-Bond Houses Work

THE financing of apartment houses, hotels and business structures, which requires the stiffest kinds of rentals to make them pay, is based upon the assistance of the flocks of new mortgage-bond houses which are very noisy advertisers of their wares.

The capital which these new mortgage-bond houses use in their business is usually raised by selling their stock to people through the use of high-pressure salesmen. These companies also employ the same type of salesmen to sell their "bonds" which are secured by real estate mortgage.

These new mortgage-bond houses generally loan sixty per cent of the appraised value of land and improvements. The best type of old mortgage houses limit themselves to fifty per cent and careful mortgage-bond buyers still insist upon honest adherence to this standard.

The appraisals of the new mortgage-bond houses are open to serious criticism although they seem to be getting by with it. They insist upon using the earning value of the properties based upon ninety to one hundred per cent occupancy instead of the sound basis of the concrete worth of the ground and structures.

This fast and loose method of making appraisals enables an apparently fifty per cent mortgage to be in reality seventy-five per cent of the honest-to-goodness value of the property. That these optimists have been winning out does not justify their practices. Banks scrutinize real estate loans more carefully than ever before, and reckoning is near.

The persons or companies making these appraisals are usually under the control of the mortgage-bond houses and naturally assent to suggestions.

Such mortgage-bond companies are simply betting upon good industrial conditions, population growth and present high rentals continuing forever. This might be all right for a plunging merchant buying goods, but it isn't fair to the buyers of these bonds. Mortgage companies have failed during past periods of depression and they will do so in the future.

These mortgage companies usually charge their borrowers a fifteen per cent discount of the face of the loan and seven per cent current interest for a ten-year term. The bonds begin to mature in the third year and are paid off under a serial plan until at the end of ten years but about sixty per cent remain unpaid.

A new mortgage is then placed for this amount upon a low-rate, long-term basis giving the factor of safety the high-tension salesmen claimed existed at the outset. During the interim things have been more or less risky.

The Federal Trade Commission has had some of these mortgage-bond houses upon the carpet for stressing safety and related features of their bonds whose existence the commission questions. Many of these bond houses advertise that their clients have not lost a cent. They fail to say they have not been in business long enough to establish a record of strength in lean as well as fat years. *One concern that has forty-nine millions outstanding has only had time to pay off eight hundred thousand dollars.* Some of these companies claim banks buy their bonds. Perhaps some poor bankers have bought a few of them, but if a bank examiner found any bank relying upon such investments he would order them sold at once and give the officers a reprimand they would be likely to remember.

After arranging a loan from a mortgage-bond house (which incidentally establishes a ratio of value for use in other dealings) the operator has to raise the balance of the money. This is often done through the sale of second mortgages or preferred stock in the building company, carrying at least eight per cent interest or dividends. The discounts and selling costs are much higher than the mortgage-bonds and the amounts of these issues frequently far exceed the equity remaining after the first mortgage.

Frequently the builder must quickly raise the cash for the land to give the mortgage-bond company a clear title so that money will roll in. The short-term money Shylocks will help him out—for a price. One apartment house builder recently paid a $46,000 bonus for a $220,000 one-year loan at seven per cent—or more than twenty-eight per cent in all!

The Contractor Protects Himself

CONTRACTORS, always in quest for work to keep their organizations busy, usually arrange to take half of their payment in second mortgages or preferred stocks. As insurance against losses upon this paper the contractor adds at least thirty per cent to his figures before computing his profit. He is speculating too.

Contractors who become loaded up with such paper sometimes trade it for an apartment house whose operator is not making good. They also sell preferred stock against it on the basis of the deposit of $120 of paper against $100 of the issued stocks upon which they realize perhaps seventy-five per cent of par after the high-tension salesmen and other expenses have been met.

These apartments are set down in any sort of neighborhoods, just so they are near transportation routes. Ability to pay is the sole requirement of tenants. A couple of business women who bought a "garage" house in the suburbs to get fresh air remarked it was nice to find a place where "walking was a recreation and not a business."

The tenants have to pay rents that will carry all of these imposts, the upkeep of the buildings, taxes and a dividend to the holding company. This is why a Murphy bedroom, a kitchenette and a bath in a second-rate apartment cost the tenant so much in rent that no start can be made toward owning a home. It also explains that present-day hotel room rates are high, not because of Prohibition, but to meet this sort of financing.

It is estimated the bond interest and taxes upon a mammoth hotel now under construction in a midwestern industrial center will average two dollars a room a day.

As the reader has probably assumed, the bulk of this kind of house finance business is in the hands of a certain race among whose characteristics is a native talent for computing interest. They instinctively prefer the exploitation of society to productive labor and constructive enterprise.

One of these operators, who controls a mortgage-bond house, a discount company and several realty corporations, got into quite a jam in selling bonds to the public.

One Promoter's Financial Gymnastics

THIS promoter secured the tentative permission of the state securities commission to put forth a $260 000 mortgage-bond issue based upon one of his companies having title in a certain apartment house.

Nine months passed, during which $175,000 of the bonds were sold to the public. The definitive papers not being filed, the state officials wired a peremptory demand for them. The promoter's lawyers busied themselves in preparing the documents and reported in consternation to their client that title to the property was vested in another of his companies than the one that had mortgaged it. It required hard work to adjust this situation. The buyers of the bonds had no protection at all during the interval.

True to form, the reckless promoter, after extricating himself, promptly sold the company that had really owned the property to the corporation that had sold the mortgage to his mortgage-bond company. He marked up a paper profit upon the transaction and paid dividends according to the custom of the trade.

The mortgage or mortgage-bond buyer who does not restrict himself to paper guaranteed by a reputable trust company whose capital bears the proper relation to its risks upon such commitments is taking a chance regardless of the advertisements and the high-pressure statements. Such a guaranty of bonds should not be confused with a trust company merely acting as trustee in a bond issue. The trusteeship does not bind the trust company to make poor bonds good, as is the case where it makes a specific guaranty. However, some bond salesmen confuse the relation and responsibilities of trust company trustees when dealing with inexperienced buyers. Other mortgage-bonds may be good "business men's" investments, but they are decidedly not gilt-edge.

Boy Police Protect City's Children

Six Hundred Receive Duty Badges; Will Eliminate Rougher Element

By ROBERT H. MOULTON

Two junior policemen hauling an offender to the office of the playground director.

FOLLOWING a period of several months' training, six hundred Chicago schoolboys have taken up their duties as junior playground police. At a public ceremony held recently they received their badges from municipal officers and took the oath of allegiance to their respective schools. The purpose of the junior police, according to Charles H. English, supervisor of playgrounds, who was responsible for the unique organization, is to give boys a project in citizenship to work out for themselves. The boys will not have the power of arrest, but they will be responsible for the protection of playground property and of boys and girls at play.

"In the sixty-one playgrounds adjacent to public schools and on school property in Chicago, there is no police protection," said Mr. English. "In any playground the problem of property damage, intimidation by the rougher element, and similar abuses, is always present. It is one of the annoyances that add to the difficulty of the playground director. Moreover, it is practically impossible to apprehend the culprits.

"The junior police were organized, in part, to eliminate this problem. Nine leaders were selected at each playground and organized into a police squad, with one outstanding leader as a sergeant. In this way we corralled the boys who know what is going on, and through whom we can influence the boy life of the neighborhood. Eleven picked officers of the junior R. O. T. C. are acting as officers of the junior police force, the major cadet of Lane High School being the chief of police. The city has been divided into districts, with an R. O. T. C. lieutenant in charge. The total force comprises 570 boys. All officers have gold-plated police stars and the patrolmen silver-plated ones."

Junior policemen receiving their badges or police "stars."

The junior playground police have two uses. In the first place, they help keep order in the playground: actual order, like stopping quarrels and nagging, keeping the boys in their turn in the various games, making them stick to the rules, stopping dangerous practices in play, and so on.

Their second duty is that of constructive service. This phase is not the ordinary conception of police duty, and herein the junior police go the police idea one better. The boys assume leadership in all activities as promoted on the playground. The playground director usually has a job putting over any projected event. Either the boys and girls show only slight interest in it, or they are so keen about it that the director finds it impossible to handle the mob that descends upon him.

Under the new order of things the director calls the school squad, outlines his plans, and the junior police act accordingly. They round up the boys and girls in the neighborhood to take part if necessary, and they are on hand to help keep an over-enthusiastic crowd within bounds. Thus the playground director has as his assistants at all times nine dependable, loyal, organized leaders, who police the grounds and aid in the organization and operation of all activities.

There is still a third objective in all this—civic training. Many of us will, no doubt, recall how, as boys, we felt a natural antagonism toward a "cop." We had nothing in common with him. He failed to get our boyish point of view and we couldn't see his. The result was that we were always against the officer and the law, and experienced a sort of unholy glee whenever we managed to get the best of him.

The junior playground police have been put on the other side of the fence. They are on the side of law and order. They get, through their own experience, a sympathetic understanding of the policeman's duty. They see the difficulty of law enforcement, the need for fair play, protection of the weak, and a due regard for property rights and the privileges of others. Thus the boys intrusted with police responsibilities will, it is believed, gain a respect for the law which they will carry over into adult life.

Of course, the transformation of a "gang" leader into a junior policeman is not accomplished all at once, nor without some strain on the boy himself. He cannot accept the responsibilities suddenly thrust upon him and perhaps the jeers of his old crowd, without some moral backing. He needs help at first, and he gets it. Gradually he gains confidence in himself, and the other boys learn to respect his authority and to co-operate with him.

They tell a story of Dan Spira who attended a school in one of the foreign districts of Chicago. Dan, they say, was a leader of a gang of little rowdies who delighted in nothing so much as to bully other children and generally rule the roost when the playground director wasn't looking. He gloried in his acquired "toughness" and was constantly being reported to the director.

The latter, however, had sensed Dan's leadership, so when the junior police plan was ready to be put into operation he called Dan into consultation. He explained to the boy just what the plan was, painted a picture of the honor that would come to the playground policeman, and wound up by offering Dan a place on the school squad.

Dan seemed a bit dubious.

"Aw, but how would these kids ever know I was a copper anyhow?" he asked.

"Why, you would wear one of these," answered the director, and held up a shiny new policeman's star.

Dan's eyes glistened and his chest swelled.

"Gee," he exclaimed, "I'm for it. Give me one."

A junior policeman showing his badge of authority to the leader of a "gang" and giving him a little good advice regarding his behavior.

The result was that when Dan had finished his period of training he was the best patrolman on the school squad and as strict about preserving order and fairness on the playground as he formerly had been lax in these respects. It is rumored that Dan had to settle with certain members of his former gang who insisted upon referring to him as a "sissy," and that after each such settlement the name of a new applicant for admittance to the school police squad appeared on the director's waiting list.

The junior policeman at all times receives the encouragement of his playground director and of his visiting officers. He is granted little special privileges. Competitive drills are held on an inter-playground plan. The junior policemen are also called out for public occasions, and thus the boy gets into the limelight. Finally, and not the least important consideration to the boy himself, he automatically becomes a member of the "Knot-Hole Club."

The Knot-Hole Club was established several years ago by the presidents of the two major league baseball clubs in Chicago. During the summer vacation several hundred boys and girls from the Chicago playgrounds are the invited guests each week of the National and American League clubs. To be a member of the Knot-Hole Club a boy or girl must have won special distinction for the week in some form of work on the playgrounds. This form of reward for special effort is doing away with medals, ribbons, and the like. The junior police are permanent members of the Knot-Hole Club. The others may change from week to week.

That there is a powerful appeal to the average boy in the distinction that goes with the title of patrolman or officer is indicated by the fact that at each of Chicago's sixty-one playgrounds there is a long waiting list. These boys form auxiliary squads, and for this reason the regulars look to their laurels, knowing that there are any number of other boys willing and anxious to take their places.

"We are finding," commented Supervisor English, "that the junior police are not only valuable in that capacity, but are the best of aids to our education system. They are the leaders. They are looked up to by the other boys and they form the best kind of a link between the school boy and the school system."

Mr. English, incidentally, is one of the noted recreation specialists of the country. In addition to developing the playground work at Chicago and in other large cities, he served during the war as executive director of the recreational activities of the government employes, under the organization known as the War Camp Community Service.

The Newspaper World

PRIOR to the adoption of the Declaration of Independence by the Continental Congress of America, which was first convened in Philadelphia in 1774, there were no newspapers, no printing presses, in general use. Printing by movable type had been invented, and a few copies of letter-size sheets had been printed, mainly for the ruling class in the Old World, but it remained for the New World to discover and develop printing and newspapers and the power of the press as it is known today.

Early after the adoption of the Declaration of Independence, newspapers in the New World began to attract the attention of the Old World. The first newspaper published in the United States of America was *Publick Occurrences,* which made its adventurous appearance in Boston in 1690. Other newspapers had careers more or less dubious, until in 1841 the New York *Tribune* was established by Horace Greeley. The enduring success of the *Tribune* was followed in substantial order by many newspapers springing up all over the country.—*Enos Eli Sutherland,* in "Spiritual History and Destiny: Kentucky."

Should U. S. Have Department of Education?

Concluded from page 2

> purposes of this character, which may perhaps in the end accomplish control of public opinion. I would as soon vote for a bureau that should have supervision of the press of the country, or of the religion of the country, as I would for a bureau that should control education throughout the land."

Even Thaddeus Stevens, the arch-centralizer and uplifter of the time, turned against the proposal after making its first acceptance possible, and voted for the abolition of the department. He was quoted as saying that his vote for it was the only vote he had ever regretted.

Those who argued for the department referred freely, as proponents of a more far-reaching venture do now, to the allegedly poor showing of our schools in comparison with those of some European countries, *notably those of Prussia*, after whose schools those of most other "progressive" European countries were in great part modeled.

> "France, Prussia, Austria and Russia," said Ignatius Donnelly, "have made education an affair of the state. In Prussia the minister of education ranks next to the king. But the United States has allowed despotisms to build up their mighty systems of education while in this, its capital, not a department, not a bureau, not even a clerkship is to be found representing the greatest of all interests."

To which another member of Congress replied:

> "Under a monarchical government you will find in every communication from the throne to its agents some such declaration as this: 'Utilize public sentiment in favor of the throne by instilling in the minds of the masses uniform sentiments which shall sustain the throne.' "

The department was reduced to bureau status evidently as a declaration that the government had no intention of launching a national program of common school education, which many of the department's proponents unquestionably wished to be done.

The bureau has never had any power whatever over the schools of the states.

> "I have served under five commissioners of education," an official of the bureau tells the writer, "and not one of them favored Federal interference with the schools."

"What difference does it make whether we are a bureau or a department?" one of them asked. "What we do has value or lacks it regardless of whether it is done by a department or a bureau. All that we want are means for doing more and better work of the kind and only of the kind we now do. *Neither we nor anybody else in the Federal Government should be given the slightest power over the schools.* And as for Federal 'aid' in the form of money, you must not forget that education cannot be imposed from above; it must first be sought from below."

Thus the question now is succinctly as follows:

> 1—Should there be a Federal department of education?
>
> 2—Should the Federal Government make appropriations for the schools through such a department or otherwise?
>
> 3—Should the Federal Government in any event or under any conditions have any power of supervision or control over the public schools?

Many persons who oppose the last two propositions favor the establishment of a Federal department of education, under which would be co-ordinated as many as practicable of the educational activities now engaged in by the Federal Government, and perhaps the government's general welfare work as well. Outside of those activities now carried on through the Bureau of Education, which in addition to research work conducts the schools for natives in Alaska, few if any of the present educational undertakings would fit well into such a department. This department still would have most to do with the public schools. About the only ground, however, upon which it is opposed is that in all probability its establishment would be an entering wedge toward Federal aid and ultimately Federal control.

It would be a miracle if a department of education didn't quickly become a leader in putting forth propaganda for Federal aid and ultimately for Federal control of the schools, for only in that way could the department grow in political importance.

Most of the propaganda now for a Federal department of education has distinctly in view Federal aid. The Sterling-Reed Bill, for example, deals chiefly with Federal aid, providing an initial appropriation of $100,000,000 a year to be distributed by the proposed department of education.

While the bill disclaims that the Federal Government would demand in return for this money the right to supervise or control the schoools, *conditions precedent to obtaining the funds would entail a very pertinent degree of Federal supervision.* These conditions in themselves may not be objectionable, but if they can be imposed, any others which those in power might want to put forth could be attached in the form of "strings" to Federal funds. *These could go to the extent of prescribing books or anything else having to do with schools using Federal money. Any state could avoid the conditions by refusing the funds, as some have refused maternity-aid funds*, but it would be penalized to the extent of such money paid by it into the Federal Treasury for aid to schools in other states. For the money received from the Treasury would have to be first put into it by the citizens of all the states.

Yet a great deal of what the proponents of Federal aid say about educational conditions in the country as a whole is unquestionably true. This is particularly the case as to inequality of educational opportunity afforded the children of the country. The end ostensibly aimed at, which is the giving of all children an equal chance to secure a good elementary education, is agreed generally to be a good one.

Can this end be attained safely by throwing the power of the Federal Treasury behind the schools?

Is it being or can it be attained in any other way? These points will be covered in a succeeding article.

How Patrick Henry Helped Save the Northwest

Concluded from page 9

Before nightfall the inhabitants had taken the oath of allegiance to a republic, the life of which the soldiers of Washington were still fighting to preserve. Commander Rocheblave was sent back to Virginia in chains, because of his violent and insulting remarks. His slaves were sold for $2,500 and the money divided as booty among the soldiers, who received it as the first financial reward of the expedition. A small party of soldiers now went to Cahokia, which readily submitted.

Clark's next plans were to strike at Detroit. These were frustrated by many of his men refusing to renew their enlistments. Meantime, Governor Hamilton had become active. He was gathering Indians preparing to recapture the country for the British. After long delays Clark decided on a bold stroke. The attack was a surprise. After two hours of fighting the British sent out a flag of truce. This was refused. Hamilton and his entire garrison then surrendered. With the exception of the fort at Detroit, Clark with a few men had brought the Old Northwest under the allegiance of Virginia and to the Revolutionary cause. It was the boldest, the most romantic expedition in the history of the Old Northwest.

Many of the original documents about Clark's life were gathered among his relatives and friends by Draper before the Civil War for the purpose of writing several volumes. When he failed to do it, this information was utilized by Theodore Roosevelt in the preparation of his several volumes on the "Winning of the West." Later the scholarly historian, Rueben Gold Thwaites, used them in the writing of his book, "How George Rogers Clark Won the Northwest."

"Although Clark was of great service to Kentucky and Virginia, in keeping in order Indians and French along the Ohio frontier during the remainder of the Revolutionary War," declares Mr. Thwaites in appraising Clark's service, "his reputation and consequently his power had reached its climax with the capture of Vincennes.

Through the remainder of his life, Clark was a close friend of Thomas Jefferson.

There is a story that when commissioners sought Clark in his old age, bearing a richly ornamented sword voted by the state of Virginia, he received it with rage.

"When Virginia needed a sword, I gave her one," he shouted in anger. "She sends me now a toy. I want bread."

At the home of his sister near Louisville, he died in 1818 and was buried at Cave Hill cemetery. Kentucky counts him among her immortals.

How the Great Lakes Were Placed on the Map

Concluded from page 5

ings of the next year. Dollier and Galinée wintered on Lake Erie and went on toward the Detroit River. However, one night a storm destroyed the canoe containing their sacred symbols and their powder, making it seem imperative for them to return. This the two Sulpitians did by way of the Detroit River and Lake St. Clair to the Sault and by Ottawa to Montreal. Young Galinée had been taken along partly because of his ability as a cartographer. His map of 1669 strangely merges Lakes Michigan and Huron, but Lakes Erie and Ontario are correctly given.

Joliet after his return from the Mississippi made a map of the five Great Lakes which is only the first of a series made by him. Joliet designates Lake Michigan as Lac des Illinois or Missihiganin. With Joliet and Marquette the southern extremity of Lake Michigan was correctly outlined and the Jesuits two years before completed the mapping of Lake Superior. This completed in large outlines the topographical knowledge with possible exception of the southern shore of Lake Erie.

Duluth (Du Lhut) was sent in 1686 to establish a fort near the entrance to Lake Huron; Fort St. Joseph appears on many maps well into the eighteenth century near the present Port Huron. Detroit was founded by Antoine de la Mothe Cadillac on July 26 in the year 1701. Detroit appears upon printed maps first in 1703, upon the map of Canada and the map of Louisiana made by the able French cartographer, Guilliaume Delisle. After Joliet and Marquette had reached the Mississippi La Salle sailed down the great river to the Gulf and began French interest in Louisiana, uniting French interest in the Gulf of Mexico and in Canada by the claim to the whole Mississippi Valley. However valid the French claim by discovery and exploration, the English colonies could not be confined to a narrow strip on the seaboard. The English outnumbered the French in America in the early eighteenth century twenty to one and the final fall of French rule (which came in 1763) was inevitable.

A phantom dream led Columbus across the unknown ocean, in search of Asia, to a far greater and richer land of promise. The same dream of Asia animated Cartier, Champlain and La Salle in the succeeding centuries. But the error pursued honestly by courageous and noble souls, able to utilize even their mistakes for the benefit of mankind, led to a truth far finer than their dreams.

Wheat Farmers Drop Two Millions a Year

Concluded from page 6

other so-called "modernists," were used to sign up the farmers on the seven-year contract. So far as the writer knows, this is the first time that the Sapiro plan has gone beyond five years as the term of its contracts. This step denotes an extension of the effort to see just how much the American farmer will endure.

Within the history of the Northwest Wheat Growers Associated is an interesting little chapter regarding the subsidiary corporation which Mr. Sapiro announced would "own the necessary warehouses and elevators." In 1914 one C. W. Nelson persuaded the farmers to go into debt for a number of so-called co-operative elevators—that is, the Sapiro type of co-operation. Because of several other reasons over which the farmer had no control, this scheme was soon on the rocks, but not before a number of elevators had been built, along with warehouses, in the name of the Tri-State Terminal Company. This was the organization which Sapiro planned to wish onto the farmers in the Northwest Wheat Growers Associated.

Such a deal was a little too strong for the farmers' unions, however, and, led by a sterling old American gentleman of Walla Walla, a former state senator who was also prominent in farm activities, they forced Sapiro and his lieutenants to back out of the Nelson deal. It might be added that a certain Gentile bank in Portland is still "holding the sack" to the extent of some hundreds of thousands of dollars on the Tri-State Terminal Company. This is the only chapter in the history of the Northwest Wheat Growers Associated, or in that of any of its branches, in which the farmer was not a loser.

Incidental to the inception, rise and fall of the Northwest Wheat Growers Associated, was the Sapiro-born scheme of "gold wheat bonds," literally acceptances, by which the association planned to tie up the farmer still more completely. These were scotched by the farmers unions, and by some of the farmers in the association who had even then begun to see that certain fallacies lurked in the business.

Salaries of five to fifteen thousand dollars yearly were paid to at least fifteen men at various strategic points in the Northwest Wheat Growers Associated. In Idaho, the state association went into the warehousing business by the purchase on time payments of a number of warehouses. This state association is now bankrupt, the grain supposed to have been in its warehouses has disappeared, the trustee has been unable to find any assets, and cannot learn what became of the grain which the farmers delivered to these warehouses, and which the association never reported as sold. Some farmers lost their entire wheat crop for three years, no accounting ever has been made, and the members have just learned that they will have to complete the payments on the warehouses, or lose their farms.

The Washington state association, with headquarters in Spokane, has voted to disband, but, like the Northwest Wheat Growers Associated, is compelled by law to render a financial statement and accounting before being permitted to liquidate. This branch has issued a statement to the farmers in which it admits that it cannot pay for either the 1922 or 1923 wheat crop, but hopes to pay something on both by the end of 1924.

The Oregon state association is in the same condition, except that it is being kept alive by several men, in an effort to turn it into *a private marketing organization, disguised as a co-operative selling association,* based on the lists of credulous farmers remaining from the membership campaign for the Sapiro-Plan state association.

In Montana the story is the same; there is no need to repeat it.

Throughout these four northwestern states, there is no evidence to show that the Sapiro-Plan co-operative associations ever received for their wheat a gross price any higher than that received by legitimate co-operatives or unattached farmers. It has been proved that the wheat which the Sapiro-Plan associations exported was sold at a lower price than that paid to the independent exporters. The greater part of the wheat turned into the Sapiro co-operative associations by the farmers was sold. Oh, yes, it was sold all right! But the farmer was not paid for it.

Most of the wheat sold by these associations was merely peddled from one to another of the coast mills in the Northwest. These mills soon adopted a system of discounts, some of them quite heavy, as a protection against the "fixed price" of the associations, and *the managements of the Sapiro-Plan associations accepted the discounts.* Not once was a private member of one of these associations consulted as to when or where he wanted to sell his wheat, or what price he wanted for it. Managers of mills in Idaho, Washington and Oregon admitted to me that they had at all times bought wheat more cheaply, and on better terms, from the sales managers of the Sapiro-Plan co-operative associations, both state and regional, than they could buy the same grades of wheat, on the same dates and in the same places, from the independent growers.

In Idaho, the independent buyers who went in to try to save the farmer by straightening out the state association on a business basis, found that fictitious charges had accounted for much of the wheat. Losses when wheat went down, and losses from management, were absorbed by fictitious interest and terminal charges. These independent wheat dealers learned, while they were on this investigating board, and the receiver has since learned, that one experienced wheat dealer could have operated this association at one-third the cost which the Sapiro management incurred.

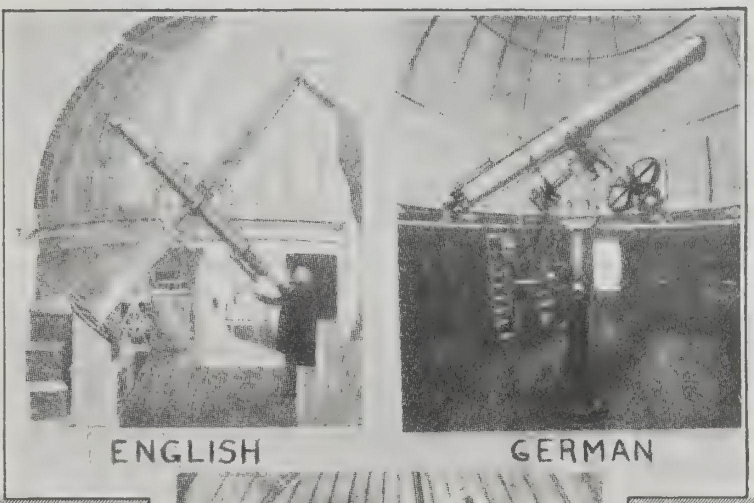
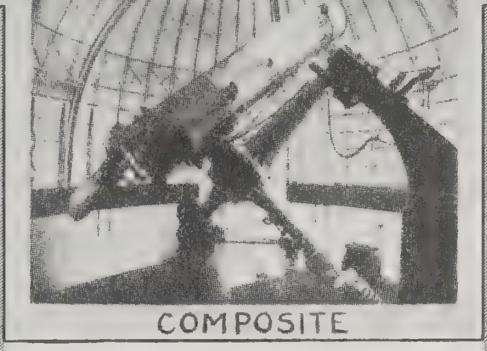
The Evolution of the Modern Telescope

THE modern telescope and interferometer have been instrumental in revealing to us the stupendous vastness of the physical universe. Antares, the giant red star, is the largest now known. Its distance from the earth is so enormous that if we were to travel at the rate of one hundred million miles a year the journey to Antares would require twenty-one million years. At this same rate of speed we would consume ten million five hundred and fifty thousand years in making an excursion to Betelgeuse, the other red star whose diameter, as determined by the interferometer measurements at the Mount Wilson Observatory, is approximately two hundred and forty-two million miles. The diameter of Antares is about three hundred and eighty-two million miles. The nearest known star, *Alpha Centauri*, is twenty-five and six-tenths trillions of miles distant from the earth. When we compare these colossal magnitudes with the earth's diameter of about eight thousand miles we begin to realize the almost zero dimensions of our little planet when compared with the great macrocosm. The modern astronomer has introduced large units of length to cope more readily with the great distances which are inevitable in his observations. The mean distance of the earth to the sun, that is, ninety-two million nine hundred thousand miles, is known as the astronomical unit. There is a still greater unit called the *parsec* which is equal to about nineteen trillion miles. In terms of this unit, *Alpha Centauri* is at a distance of about one and three-tenths *parsecs* from the earth.



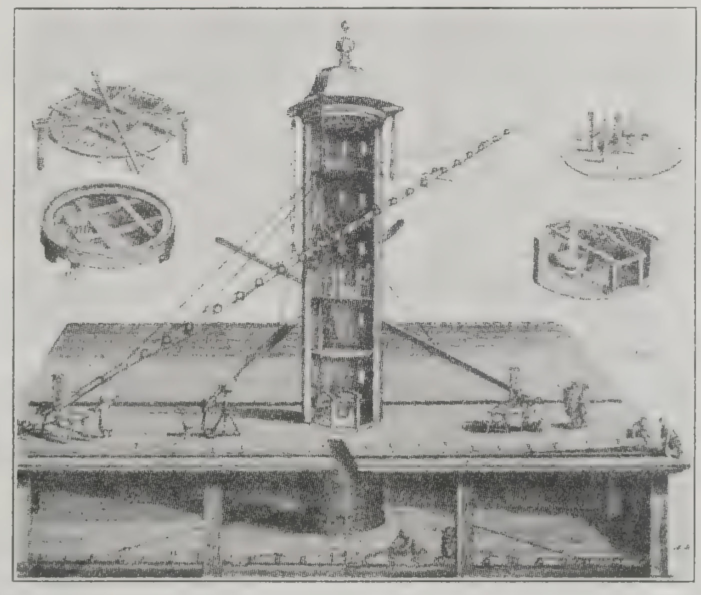


The three principal methods of mounting telescopes, known as the English, German, and Composite, are shown in this illustration.

The Hooker reflecting telescope, Mount Wilson Observatory, Pasadena, California. It is the largest reflector in the world. Its clear aperture is 100⅜ inches and it has a primary focal length of 507.5 inches. The complete tube weighs 35 tons and the total weight of all its moving parts is 100 tons. The parts are constructed of structural and cast steel some of which weigh ten tons. The mirror is 101.2 inches in diameter, has a thickness of 12¾ inches, and weighs 9,000 pounds. Mount Wilson has an elevation of about 6,000 feet above sea level.

The 150-foot tower telescope of the Mount Wilson Solar Observatory. The lens which is used has an aperture of twelve inches and a focal length of 150 feet. This telescope is used with a 75-foot (focal length) spectograph.

Interstellar distances, and astronomical distances in general, are by-products of the range of modern astronomical instruments. Astronomy, however, is one of the most ancient of all the sciences. We know that the ancient Eygptians and Babylonians studied astronomy. The Egyptians applied their knowledge of this science in the establishment of a year consisting of twelve months of thirty days each. An auxiliary month of five days was added to complete the calendar year of three hundred and sixty-five days. The sun was thought, by Anaxagoras, to be composed of burning iron. In the third century B. C., Aristarchus taught that the sun is the center of our solar system, thus antedating Copernicus by more than seventeen centuries. Copernicus (or Koppernigk, in Polish) was born in Thorn, Poland, Feb. 19, 1473, and died at Frauenburg, Prussia, May 24, 1543.



The observatory of Hevelius (about the year 1680) showing three giant telescopes suspended from a rotary tower.

It is difficult for us to realize that in the time of Copernicus the telescope was unknown. Tycho de Brahe (1546-1601), the illustrious Swedish astronomer and the teacher of the famous Kepler, used graduated quadrants for transit observations. (Tycho Brahe was not a Dane, as is usually supposed. He was born in Knudstrup, near Lund, in Sweden, December 14, 1546.)

The telescope was invented a few years after the death of Brahe by the Dutch spectacle-maker, Jansen. Galilei was the first to use a telescope, in the year 1609, for astronomical observations. His type of telescope, known as the Galilean, consisted of two spectacle lenses inserted into the ends of an organ-pipe made of lead. The first Galilean telescope had a magnifying power of three diameters. A later type had the magnifying power of thirty diameters. By this telescope Galilei discovered the mountains of the moon and the satellites of Jupiter.

Essentially a telescope is a tube provided with various combinations of lenses or reflectors arranged in such a manner that the light proceeding from the observed object is gathered and then concentrated at the focus in a small but brilliantly illuminated image. This is the first function of a telescope. The second function of a telescope is to magnify the image thus produced by means of a microscope, known generally as an eyepiece. It is evident that telescopes may be divided into two great classes, the *refracting* and the *reflecting*, the type being determined by ascertaining which of these two methods is used in transmitting the image to the observer.

An Italian Jesuit, Father Zucchi (1616–1652), was the first to employ an eye lens for the purpose of viewing the image produced by a concave mirror. James Gregory (1638–1675), the Scottish mathematician, in the year 1661 invented the first reflecting telescope. In the year 1611 Kepler, in his "*Catoptrics*," suggested the use of two double convex lenses in the Galilean telescope. Father Scheiner, in 1630, constructed a telescope using the principle suggested by Kepler. Sir Isaac Newton developed the Gregorian principle into the Newtonian reflector.

Cassegrain, in 1672, invented a form of reflecting telescope which is very popular at the present time. Fundamentally the Cassegrainian reflector is the same as the Newtonian. Cassegrain substituted a convex reflector for the Newtonian diagonal reflector.

Giant telescopes were introduced about the year 1680. Some of these telescopes were 210 feet long. The Hevelius giant aerial telescopes were suspended from the roof of a tower which could be rotated by a gearing mechanism. We are indebted to *Nature* for the illustration of the Hevelius aerial telescopes and also for the photograph showing the methods used in mounting telescopes.

When we compare the Hevelius telescope with the Hooker at Mount Wilson, the remarkable development of this instrument is strikingly apparent. The largest telescopes in the world are the Yerkes refractor, at Chicago University, and the Hooker reflector, at Mount Wilson.

And the end is not yet. There is no doubt that despite the strides that have been made in the elimination of the immense space that divides us from the heavenly bodies, there are still greater discoveries pending.

BRIEFLY TOLD

Twenty-five thousand sea lions along the coast of British Columbia have been killed by the Dominion authorities. The sea lions destroy large amounts of salmon and other edible fish. Experiments are being made to see if the skins can be utilized for any profitable commercial purpose.

The two main forms of sport popular in Austria are mountaineering and football.

The Japanese Government has decided to pay all the traveling expenses of Japanese natives who emigrate to Brazil, and to make a grant to each of two hundred yen or one hundred dollars.

Remnants of the ice age are particularly interesting in the Rocky Mountain National Park, where huge valleys have been plowed out through countless ages, possibly five million years ago. Glaciers transformed what was a single mountain mass into three peaks, Long's, Meeker and Lady Washington, with Long's rising to an elevation of 14,255 feet, or nearly three miles above sea level.

Germany is buying American mules to replace oxen in agricultural work.

The fish crop of the world costs the consumer a billion dollars yearly, of which seven hundred eighty million goes to those who harvest the crop.

"If the people of other lands are unwilling to become subject to you, improve your culture, perfect your institutions, and thus win their hearts and judgment."—*Confucius.*

The Department of Agriculture says that the United States can support a population of 300,000,000 with no greater demand upon outside food sources than that which exists today.

One hundred years have elapsed since the song "Silent Night, Holy Night," now sung as a Christmas carol throughout the world, was composed in the little village of Oberndorf, near Salzburg, Austria. In commemoration of the event a monument is to be erected in Oberndorf.

American investments in the Philippines increased slightly during the year 1923 compared with 1922, and the Chinese more than doubled theirs.

Robert Bridges, poet laureate of England, who resided for several months recently at Ann Arbor, Michigan, is, as far as can be ascertained, the first poet laureate to visit the United States.

A banker named Jenkins had a manufactory of "antiquities" in Rome in the late eighteenth century. He supplied foreign visitors with intaglios and cameos made by his own workmen, whom he kept in a part of the ruins of the Coliseum.

It was formerly the custom in France when the president spoke at public banquets for the audience to remain standing during the speeches. This has been abolished by the new president, M. Doumergue.

The building of the Great Wall of China was begun 214 B.C. Its length is 1,400 miles and the height varies from 15 to 30 feet.

The world's railroads, if placed in a single line, would reach to the moon and back and encircle the globe nearly eleven times.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

When questioned in the House of Commons, Premier Ramsay MacDonald has again refused to make the charge that in modernizing the fleet, the United States was defeating the purposes of the Naval Treaty.

Great Britain has finished the fiscal year with a surplus of nearly $250,000,000, and her unemployed are decreasing in number.

According to the *Bookman,* there does not seem to be any preventive which will save books, many of them unique copies, from destruction once the bookworm, unnoticed, starts its deadly work.

The first air voyage ever made across the Pacific Ocean was that completed on May 17, when three airplanes of the United States Army Service landed in Kashiwabara Bay, Paramushir Island, Japan.

"Home brewing" in France of an imitation of the forbidden absinthe, made from an aniseed base, is causing much trouble to the authorities.

Human hair exports from Hongkong during 1923 amounted to approximately 99 tons. The principal markets were in Japan, France and the United States.

Christian Leden, the Norwegian explorer, says that the theory of a relationship between Eskimos and American Indians is confirmed by the kinship between the music of the Eskimos and that of the primitive peoples along the entire American coast.

It is estimated that in the cotton mills in China 40 per cent of the workers are women, 40 per cent are children, and only 20 per cent are men.

Forty or fifty big buildings divided into 20,000 rooms are being prepared by the Fascist government of Italy for the accommodation of part of the pilgrims to Rome during the Holy Year.

The French have always been accustomed to the "accolade," or kiss on both cheeks, but the fact that the new premier kisses his party leaders and all the members of his cabinet on the mouth has aroused public opinion.

There are glaciers on three of the highest mountains in Equatorial Africa—Mount Kilimanjaro, 19,321 feet high; Mount Ruwenzori, 16,800 feet and Mount Kenya, about 17,007 feet high. Ice caps 200 feet thick fill the ravines.

Iceland has been so isolated—from choice of the people—that records 1,400 years old can be read and understood readily by the present-day Icelanders. Through isolation and lack of association the native tongue has been handed down with very few changes.

Members of the Apache, Kiowa and Comanche Indian tribes of Oklahoma are to receive one hundred dollars, in two payments, one in the autumn, to assist them through the winter, and the other in the spring, to help them plant their crops. The tribal funds on deposit in the United States Treasury are derived principally from the sale of surplus land.

A common tern banded as a nestling on the coast of Maine was recovered four years later in the delta of the Niger River, on the west coast of Africa.

California has made the study of the United States Constitution compulsory in all its public schools.

The Samoan native government is based on a patriarchal communism. The head of the families has absolute jurisdiction over his group.

Two-thirds of the aggregate population of the ten leading cities of the United States is of foreign stock. Approximately one-fifth of the population of Chicago and New York and only about a third of the population of Boston are of native white ancestry.

In Japan nothing is easier than divorce, which takes place by the mutual consent of the man and woman. Even though the law gives every wife the right to oppose her husband's divorce suit her consent is easily secured. The only formalities required consist of informing the magistrate that such a step is contemplated.

It costs from fifty to one hundred and fifty thousand dollars to drill an oil well, and by no means is every well an oil producer.

An astronomer of Carmel, California, has invented a camera that works eight times faster than the swiftest known camera of today and can take pictures by starlight alone. In good moonlight a one-second exposure with this camera lens will give as perfect detail as an half-hour exposure with present-day cameras.

When the herring fishing proved a comparative failure in the Shetland Islands the women turned to making hand-knit woolen goods which sell readily for high prices.

"If each country would but divert a tithe of the amount now spent upon armaments to educating people as to the enormously increased destructive power that science has put into the hands of men, the world would surely realize that, failing disarmament within a few years, civilization will go down in ruins on the outbreak of another great war."—*Commander Burney,* British M. P.

"There is one expression that continually comes to my mind whenever I think of the English language and compare it with others; it seems to me positively and expressly *masculine,* it is the language of a grown-up man and has very little childish or feminine about it."—*Professor Jespersen,* University of Copenhagen.

CHRONICLER OF THE NEGLECTED TRUTH

Savings Banks in Their Relation to Depositors

Does Average Wage-Earner Get the Highest Return for His Money?

By WILLIAM A. M'GARRY

WHENEVER a banker, a financier or an industrial stock juggler tells the story of his life, he takes great pains to emphasize the importance of thrift to those who would attempt to emulate his success. Sometimes he depends on the local and national advertising of interested persons to define the word, but more often he takes care to give his own definition—which is to open a savings account in a bank. Now savings are handy things to have, but there are many different ways of handling them.

The type of savings that the financier has in mind is supposed to bear interest ranging in different parts of the country from three to four and a half per cent. It is urged on the man of small means because both income and principal are safe. When the banker says that such accounts are one of the first steps to wealth he is telling the truth, but not all of it. He knows that nobody ever got rich out of his own individual account; that the way to reap the profits is to get control of a large number of such accounts. The banker and the stock juggler and the financier have learned how to do that, and without the savings banks their operations would be so reduced that many of them might have to go to work.

The savings bank is a ticklish subject in any industrial country. It may be and is discussed, but always from the point of view that it is to the best interests of all concerned to have wage earners use the savings banks for their excess earnings. Any discussion that takes issue with that point of view is hardly likely to find favor or a fair hearing with banking experts; it is far more likely to be condemned as a sinister attempt to destroy the whole financial structure of the country and to bring ruin and disgrace on everybody.

The reasons for that attitude are quite clear. The savings banks represent the foundation of the existing financial system, and must be protected at all hazards. One way to protect them is to surround them with legend and tradition and then refuse to permit any analysis of what they do with the money of the wage earner and what they pay him for it, except from the point of view explained above. The same interests that will argue interminably with the man who demands a change in the monetary system therefore throw up their hands in horror when the savings banks—or for that matter any specific phase of the system—are questioned. As long as the attack is general it can be made so complex by argument and misrepresentation that it is not dangerous. But when it is directed at one point in the system, an awful calamity portends. If something is not done about it the people may get some real information on the mysteries of banking.

The only purpose of this article is to shed a little light. It is not intended to destroy the savings banks, or to undermine the growing and excellent habit of thrift. It is designed to encourage saving, but in such a way that the wage earner may get a higher and fairer return on his money than he is getting now from the savings banks, and get it without any more risk than he is taking now when he puts his money into such institutions. It is intended also to give the depositor in savings banks certain simple information that the banks do not advertise, which if generally known would enable the depositors to get from the banks all that they do advertise.

States Restrict Investments

JUST now most of the savings banks are advertising. They always do in times of prosperity, when the interest rate, for some peculiar reason, goes up. If the economic experts hired by the banks are correct in their widely circulated analyses of what happens during the peak of the business cycle, it would seem that the interest rate ought to go down. These experts have been explaining for years that bonds, mortgages, and similar "basic securities," issued for long terms and also known as "frozen investments" always go down in price during periods of prosperity, and become more valuable in periods of depression. The reasons they offer seem perfectly sound. In good times, they say, the industries and commerce need money and more money with which to finance all the orders. Expansion is the order of the day. New plants are built, everybody buys, and cash is essential. Therefore it commands a rising price, by operation of the law of supply and demand. The industries and the commercial houses are willing to pay more for cash than the fixed rates on bonds and mortgages; consequently the large owners of such frozen investments throw them on the market to get cash, and the prices are forced down.

But the largest owners of these basic securities are the savings banks, and the savings banks can't sell out as the individual investor does. They cannot sell out because in nearly every state it is against the law for them to invest their funds in the quickly convertible securities offered by industries and commercial houses during periods of prosperity. Most states protect the savings bank depositor, and also the industries, by restricting the investments that may be made by the savings bank. That institution, therefore, must be content with the six per cent yield of good, solid, substantial securities. But it must also keep a balance—a record of its assets and liabilities. It is perfectly plain that if the prices of bonds and mortgages go down, even though the interest return has not been changed, the total value of such holdings on the books of the banks must be reduced. Somehow that shrinkage must be made up.

Yet it is a fact that anyone may verify by reference to his newspaper, or the car cards in the trolleys, subways and railroad trains, that the interest rates paid by the savings banks are now rising—judging by the advertising. In some sections they have risen from three to four per cent, in others from three and a half to four and a half per cent, and in a few states savings banks or savings departments in commercial banks are promising to pay depositors 4.65 per cent on their savings. The bankers may have some mysterious method of earning more money while they are writing off losses; or it may be that they are not actually paying the rates they advertise. It may be also that it is far more necessary for them to get plenty of the cheap money of the workingman just now than at any other time.

Any bank clerk can point out the "fallacy" in that argument. He will remind the depositor that the savings bank can't use its funds to get some of the big returns offered by industry. But he won't tell him what proportion of the bank's reserves is deposited in a commercial bank that is not subject to the same restrictions. He will not tell how many of the savings directors are also directors in these commercial banks. He will not suggest that a market must be maintained for the basic securities that big investors are selling right and left, and that the way to maintain it is to add to the twenty million American wage earners now depositing their surplus earnings in the savings banks. Thus the big investors will be able to unload their frozen investments and put their money into securities showing a higher yield.

The Drawing of Interest

NOW it goes without saying that savings ought to be protected. A few hundred dollars which is all he has in the world is far more important to the worker than a few hundred thousand to a millionaire with unlimited resources and credit. Therefore, since these basic securities are safer than the short time, high yield investments now obtainable, it might be argued that it is a good thing to get the worker to put his money into them—if the banks paid what they advertised. But the fact is—and any depositor can verify it for himself by asking a few simple questions of the cashier or teller—that the banks are not paying the higher rates of interest; at least they are not paying the full amounts they promise to pay.

The amount they are failing to deliver is ridiculously small in the case of the average individual depositor. It cannot be stated definitely, but according to men who know it is commonly about one per cent, and not infrequently more. In other words, a bank advertising four per cent actually pays about three per cent to the depositor. The method by which that is accomplished will be shown later. In the meantime, that the depositor may get the proper light on what it means to the bank, let us consider the difference in the aggregate; the amount saved by all the savings banks when they fail to pay the interest rate they advertise to all their depositors.

The report of the Controller of the Currency of the United States for 1922 points the way to that analysis. It shows that as of July 31 in that year there was a grand total of more than thirteen billion dollars held in savings. That amount, however, included postal savings, school savings, building and loan associations and a lot of other forms. Some of these are in the same boat as the savings banks. Others earn and pay interest ranging from seven to ten per cent, particularly the strictly mutual building and loan associations, of which more later. The great bulk of the figures given was shown to be in savings banks—mutual and stock companies—and in the savings departments of national and state commercial banks. All those institutions combined have upward of ten billion dollars of saved money in their keeping.

One per cent of ten billion dollars is one hundred million dollars. But perhaps the banks do not save that amount. Perhaps the actual reduction in interest payments below the advertised rate, as applicable to all depositors, is not more than one-tenth of one per cent. And that amounts to ten million dollars, which would buy and pay for a vast lineage of advertising urging workingmen and women to put their excess earnings into the savings banks. It is a neat sum. Thrown into the breach when the prices of bonds begin to fall it might be expected to have an appreciable effect in checking the decline. Deposited with commercial banks which are not restricted as to the uses they may make of it, which may turn it over a dozen times a year on quick loans at high interest rates, it ought to represent a snug and satisfactory accretion of power to the savings bank directors who are also directors of commercial banks, and of industries, and of commercial organizations.

Now, as to how the banks get away with it. All operate under two sets of laws, one made by the people or their elected representatives, the other set made by the bank directors or trustees. The people's laws have nothing to say about the rate of interest, except insofar as they restrict the bank to long-term, safe securities. They do not prescribe the rate of interest that the bank pays to its depositors, nor when nor how it shall be paid. Therefore the directors make and sometimes publish rules and regulations governing those items, and if the depositor takes enough trouble he can get a copy.

If he will collect them from all the savings banks and all the savings departments in almost any community he will find that each one has a system of its own. Some of the newly established departments in commercial banks which are doing the most advertising to attract depositors make a point of crediting interest once a month. Others credit it once every three months, others every six months, and some only once a year. But all have periods of varying length during which the money put into the bank by the wage earner draws no interest whatever, and similar periods operating when the money is to be withdrawn.

Let us take a concrete example. When the bank credits interest once a month it is either on the last day of one month or the first day of the next. In the rules and regulations it will be discovered that such credits are made only on deposits placed in the keeping of the bank or before the tenth day of the month, as a rule. Some banks may specify the fifth day. If the depositor attracted by the advertising and the promise of four and a half per cent interest happens to have a pay day after the fifth—say on the sixth of the month—he will get no interest whatever on his money during all the rest of that month. The bank gains a possible maximum of twenty-five days interest. When the fixed date is the tenth, it gains a possible twenty or twenty-one days. Multiply that by the number of new depositors who fail to get their money in before the dates fixed, and some idea will be gained of the free money furnished by workers to the savings banks and through them to the financiers to keep up the price of securities.

As a rule, however, it is only the banks which have just opened savings departments which credit interest once a month. When a long list of depositors has been established the bank generally finds that the rush of work makes it necessary to credit once in three months. The result of that is to extend the free money period. The process is exactly the same in principle as that followed by profiteering retailers of various kinds of merchandise. In normal times these retailers calculate the amount of mark-up necessary to show them a profit, reducing it to percentages. A pair of shoes costs the retailer say three dollars. He decides on a fifty per cent mark-up, selling them for $4.50. Along comes a boom. Sales increase. The manufacturer thinks he might as well get some extra profit. He increases the price to the retailer to four dollars. Now the retailer is selling more shoes than ever, and his costs of selling per pair are therefore less. But instead of giving the buyer a share in that reduced cost, he maintains his old percentage of mark-up and sells the shoes for six dollars.

Thus the savings bank, having gone to the three months credit period, rules that it will pay interest for deposits made before say the twentieth day of the first month in the quarter. Depositors reaching the bank after that date get nothing in the way of interest for two months and ten days. Similar rules are made in banks crediting interest every six months, and banks crediting interest once a year. If the thrifty saver keeps his deposits intact he will get the full advertised rate of interest during the second year. But often he must withdraw some of his funds to meet some emergency.

In that event the depositor—under the rules and regulations made by the bank—notifies the teller that he intends to withdraw and states the amount. On the date of the notification the bank credits interest due. The crediting may be left until two weeks later, when the depositor gets his money back, but in any event interest is paid only up to the date of notification. Thus the bank gains another two weeks of interest payment. Perhaps, three or four days after withdrawal, the depositor finds it possible to restore the money to his savings. If the date of his new deposit happens to be the twenty-first day of the first month in any quarter, in a bank crediting interest once in three months, the depositor loses interest for the full three months. During that period he has had the use of his money for three days, and the bank has had it during all the rest of the time.

Encouragement of Thrift

IT WILL be quite obvious to all readers why no individual ever got rich under such a system as that, unless he happened to be the man on the inside, controlling the earning power of the other man's money. It is also plain why the financiers find it necessary to urge wage earners to start savings bank accounts. Once in a while a rich man who is not too closely identified with the banking system goes into details about thrift. In nearly all states there are mutual building associations, created as a result of the demand from the buyers of homes. They are subject to much the same restrictions as the savings banks. But a depositor paying ten dollars a month into such an association often finds himself in possession of $2,000 at the expiration of eleven years, and sometimes in ten years. In that time he has paid from $1,200 to $1,320. His interest return will average from seven to ten per cent.

Suppose that he put $120 a year into a savings bank, in a lump sum, for ten years, and that his deposits were not subject to any of the interest trimming described above. At the tenth year, when the final four per cent had been credited, he would have $1,478.58.

What the worker needs—and what the banker does not tell him—is the financier's point of view. The savings depositor is indifferent about a few cents interest. But the five hundred dollars difference in ten-year earnings as between the savings bank and the building fund is relatively just as small an item to the banker. Dealing in millions, he thinks of $500 as pin money—or he would so think of it if he took the same attitude as the individual depositor. But instead the banker thinks of that $500 in terms of twenty million wage earners, and a lot more who may be encouraged to be thrifty on the bankers' terms. The individual depositor can do the same thing on a smaller scale, multiplying the few cents by the accumulations of ten years, and insisting not only on knowing definitely what he is getting, and when he is getting it, but on getting the highest return possible without risking his principal.

Half a Day With Joseph Conrad

A Homely Chat With the Sea Rover

By W. TEIGNMOUTH SHORE

... he that hesitates is lost. J. Conrad

HEYDAY! A mid-May day! The sun shining brightly; a balmy breeze; white clouds sailing across the blue! It made me feel right gay to get away from London bricks and mortar, and off into the lovely county of Kent, even though it was in a stuffy, dingy train. How fresh and refreshing the bright greenery of the fields and trees! Flowers everywhere! Nature seemed astir to meet and greet the coming in of summer:

"Spring, the sweet spring, is the year's pleasant king;
Then blooms each thing, then maids dance in a ring,
Cold doth not sting, the pretty birds do sing!"

To many of us, Joseph Conrad among the company, Kent is not only the loveliest but the most interesting of English counties. It lacks the rude wildness of the North; its waters cannot compare with the lakes of Cumberland; but all else of beauty it does possess and rightly is it called the "Garden of England."

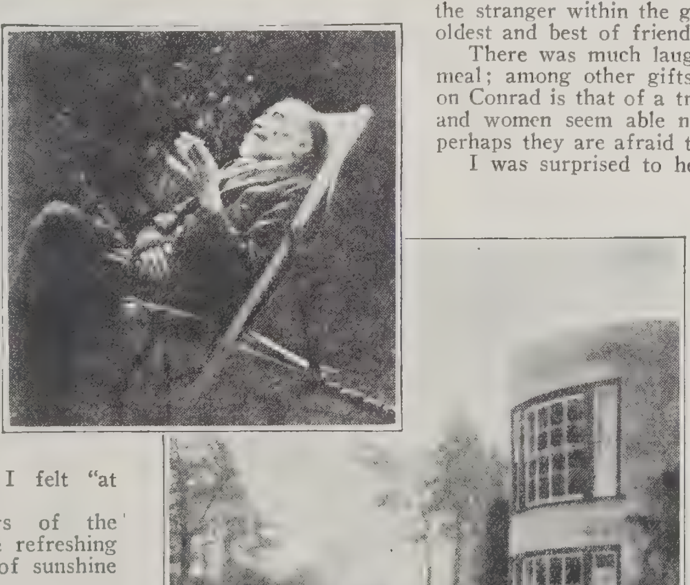
Soon the train pulled me out of the somewhat smug southern suburbs of London, and we speeded along, now between banks brilliant with flowers; now through shady woods full of green wonderment; then along high embankments with visions of rolling fields, white roads, village-church spires lifting above the trees, the curious cowls of the oast-houses wherein the hops are dried, comfortable country houses, new and ancient—a very pleasant prospect. Across the broad Medway, past Rochester with its gray Norman Castle and Cathedral and its abundant memories of Charles Dickens; through the adjoining dockyard town of Chatham, the center of much terrible business during the war; on again through the green lands with occasional glimpses of the sea, and so to Canterbury. There I was met by an automobile, kindly sent for me by Joseph Conrad, who was the magnet that had drawn me from town. Soon I was comfortably gliding past the ancient city walls; onto the New Dover Road; through the Old-World village of Bridge, and thus to Bishopsbourne, my destination.

Oswalds, Mr. Conrad's home, stands hard by the village church, which is chiefly known to fame because Richard Hooker, who is called upon his monument the "Judicious," or as we should say the sagacious, was for some time rector of this parish; known to fame by his "The Laws of Ecclesiasticall Politie," a book now more revered than read! We are carried back to medievalism—Kent is a county of multitudinous memories!—when we recall that among the relics once treasured here was a piece of the stone upon which the Archangel Gabriel alighted when he made his appearance to the Virgin Mary, to whom the church is dedicated.

I had scarcely time to note the homely face of the white house, the trim, pillared entry and the mass of creepers, when the door was opened and my host stood there with outstretched hand and a smile of welcome:

"Come in; so glad to see you!"

The hearty kindliness in his voice assured me that this was not a phrase of mere politeness; at once I felt "at home."



**The lower window is Mr. Conrad's writing room.
Insert—In friendly converse.**

The shadows of the roomy hall were refreshing after the blaze of sunshine without.

"Come into the study," he said, leading the way into a cool, white room, where there were books and pictures, a busy-looking writing-table at which sat his secretary, Miss Hallowes, who continued the cordial welcome; comfortable armchairs; a smaller table with the necessaries for making burnt offerings to Baccho. Through the broad bay window was a view of greenery; trim grass and tall trees, and in the background the park of the adjoining big house.

Joseph Conrad has the gift of hostliness; his keen eyes look at you kindly; at the same time you feel that if he were bored you'd soon be aware of the fact! So I felt happy that even to the end of my visit he was good to me. Neither a photograph nor a word-picture will do justice to his face; in the eyes there is the look which always pertains to the man who has seen many lands and sailed many seas; who has faced and fought with the rough side of life and who has won through to a haven of security and peace—as much peace as there can ever be for a master of imagination. You feel as you look at him and listen to him that his is a mind broadened by first-hand knowledge and that his fictions are built—as all great imaginative writings must be—upon facts gathered in experience.

I had brought with me a copy of some Sea Shanties, which I had recently heard sung at a London vaudeville house, and asked him what he thought of them. Truth to tell, they did not seem to interest him greatly.

"Yes, yes," he said, "but steamships have practically killed them, you know. You don't sit down and sing these things. I know them, yes, I know them, in their proper environment, helping the work of ships. I have heard them on dark, stormy nights. Halliard songs, capstan songs. One doesn't want to hear them sung to a piano in the drawing room. But steamers have beaten sails off the seas. I was up in the North Sea before and during the war—it was just empty, so to say, not a sail! And down at Deal, not long ago—the sea was empty. I can remember the anchorage in the Downs, an historic place, full of ships, sometimes held up there for days—waiting for the wind to change."

I told him how greatly envied he was to be, to have such a room as this to work in and so delightful an outlook. He laughed as I observed on the beauty of the great tree that seemed to stand guard over the house:

"I'm tired of it," he said, "I've got to know it too well."

It seemed strange to me, sitting in this quiet, so peaceful country-room in essentially English Kent, talking with a man who told me he prided himself on being really a man of Kent, and he born in far Poland! Just now and again, though very seldom, an intonation reminded me that English was not his native tongue—or did I imagine this because I *knew* it not to be so? It is amazing surely, probably unique, that one who is not English born or bred should be a master of English prose.

We did not talk much about books, as mere books; they have two interests for him I gathered, the depth of life in them and the artistry. With writers who say nothings in choice language, he will have no communion. With writers who have a tale to tell—fact or fiction—but know not how to tell it rightly he has no patience. And has not he himself set a goodly example of "how it should be done"? He is an epicure in style.

So we smoked and chatted; agreed and disagreed: I found that he was tolerant of opposing opinions, as is usually the way with really big men and seldom so with those who consider themselves important.

Then to luncheon, in another white room, where again there was the sense of quiet, complete and unostentatious comfort. Kind, genial, good-humored Mrs. Joseph Conrad, is as adept as her husband at making the stranger within the gates feel as though he was the oldest and best of friends.

There was much laughter and jolly talk during the meal; among other gifts that the gods have bestowed on Conrad is that of a true, hearty laugh. So few men and women seem able nowadays to laugh heartily, or perhaps they are afraid to do so. Why?

I was surprised to hear that he had no real liking for either dogs or cats:

"I don't dislike them; but I don't care for them to be about. They're always getting in the way! Horses! Ah, that's altogether different! I don't think we can ever be grateful enough to horses when we think of all they do for us and their love and loyalty."

He told me of the exciting visit which Mrs. Conrad, he and their boys had paid to Germany in July, 1914. First staying in Berlin; then on to Poland; while there war was declared. They were permitted to go on to Vienna, where they received cordial and effective assistance from Mr. Penfield, the American ambassador, and were able to proceed to Italy; thence by a Dutch liner from Genoa to the Thames and London and home. They were living then in a part of Kent not far from the seacoast, close by Romney Marsh, and told me of the preparations that were made to meet invasion should it come; how the farmers had been instructed to open the sluice gates and let in the sea over their fields, as the Dutch had done of old when fighting with Spain; and how they and others had received directions as to what they should do and where go should the enemy come. They did not come! Those bad days seem to all of us now like an evil dream.

After luncheon we sat on the porch at the back of the house, looking out at the garden basking in the sun. Trim yew hedges, and holly, closely-clipped; beds blazing with tall, many-colored tulips rising from masses of forget-me-nots; a splendid copper beech which has kept watch and ward over the house for many years; through an archway of roses a peep of the fruit garden, with mellow red-brick walls and a glory of blossom red and white, resplendent with promise of much fruit; and a busy gardener! All gardeners are not always busy; it must be very tempting to rest awhile, if not to slumber, when the sun is hot and the air still.

I hinted that there surely must be fairies hereabouts, and was grieved to be told in reply to my question:

"No; I don't believe in fairies. Why should I? Isn't the real world wonderful enough?"

We got to talking of poets and poetry, and I learned that he had no great admiration for most of the big names of today and yesterday; those he liked best being Walter de la Mare and William H. Davies. He told me also that he was not only being translated into French, well done, but also being largely read in English by young French writers. Some of them send over their books to him; much of their work very good, strikingly so in the case of Louis Roché by whose little volume "Temps Perdu" he had been greatly struck.

Pleasant chat made the time too short. I had been sitting in the shadow of greatness, but had *not* been chilled.

Perversity

THE Livestock Sanitary Comission of a southwestern state promulgated a regulation which provided that all cattle within a certain defined district should be dipped, a severe penalty being promised all owners who failed to respect the order.

Citizens protested at mass meetings; stock was hidden in the brush; vats were dynamited; ownership of scrawny, tick-infested yearlings was denied; armed insurrection was openly threatened or covertly encouraged.

The community chortled and jeered and shook its mane in bellicose triumph when the alarmed authorities cravenly rescinded the order.

Within a month custodians had to be appointed to prevent the unauthorized use of the vats! Those same scrawny yearlings found apprehensive owners who slipped by the guards at night to dip their vermin-swarmed doggies and scabby ewes.

If a vat fell into disrepair or the stock of lye-sodium-arsenate solution became depleted, hot anger surged through the neighborhood like a tidal wave at Apia.

Perversity!

The spirit which caused the passage of the Volstead Act to be recognized as a signal for a grand scramble for brush hootch, wool-alcohol-based lethals, and innocently-intended hair tonics, all suddenly supremely attractive to persons who never had tasted anything more potent than circus lemonade with the coloring matter omitted.

The spirit which prompts Milwaukee to return Berger and Nebraska to stomach Norris.

Independence! Personal liberty! The right to do wrong because you deny the right of anyone to stop you! The spirit which jaywalks and spits on the sidewalk and kills quail out of season and allows weeds to grow on the back lot and dances without daylight between and exceeds the speed limit and keeps cows in town and allows its dog to howl and goes fishing on Sunday and, while verbally nursing and coddling the dove of peace, raises war-talk over an immigration law, just because some ill-advised bigbody has lamely worded a missive asking it not to.

New York City's Democratic Garden Party

Religion and Politics Mix in the Struggle for Choice of Leader

By DR. EDGAR DE WITT JONES

This article presents a picture of the Democratic Convention as seen through the eyes of a Christian minister. Dr. Edgar De Witt Jones, a Detroit clergyman, was a chaplain at the convention. His view differs to some extent from that which has appeared in the average newspaper or magazine. Nevertheless it is distinctly interesting and enlightening, and his writing is distinguished by a style which is as graphic as it is direct.

"IT'S the greatest show on earth. Look!"

The excited gentleman on my left accompanied this ejaculation with a sweeping gesture, meant to include the whole of Madison Square Garden. At that particular moment my attention was centered on Franklin D. Roosevelt, who, having just nominated Governor Al Smith, had crumpled, exhausted, into a chair—a gallant figure that Roosevelt, by the way. Nevertheless, at the bidding of the excited one I looked.

The modern circus maximus was scintillating with light and color. The famous arena, so often the scene of spectacular events, was a swift-moving picture of cheering, shouting, singing, marching men and women. And above this, rising tier on tier, the flag-draped galleries filled with frenzied partisans—an army with banners, and equipped with myriad devices for making strident, hideous noises. Upon the high platform, the seat of the mighty, the throne of the keynoters, were massed shrieking, gyrating throngs, and flanking this platform on either side, the press section, the only calm area in the Garden, resembling two peaceful islands in a stormy sea. In a flag-festooned box, upon which the dazzling lights played incessantly, lo, Mrs. Al Smith, the Governor's wife, smiling, bowing right and left, her face flushed, the cynosure of ten thousand eyes, and drifting in above the din, undefeated and defiant, came the blare of bands playing "The Sidewalks of New York," the musical motif of every Smith demonstration. Thus, for one hour and fifteen minutes by the watch, Bedlam vied with Pandemonium!

The Greatest Show on Earth

MY EXCITED neighbor spoke accurately. A National Political Convention in the good old U. S. A. is the greatest show on earth. Furthermore, the 1924 Democratic Convention in Madison Square Garden was a menagerie in which every species of animal known to the political world was represented. Vachel Lindsay should have been nominated as poet-laureate for the occasion. He is the only one of our poets who has a picturesque enough vocabulary to celebrate the meeting of the Democrats in New York. In one of his gay trombonings there is a passage which has more than a suggestion of the varied and diverse specimens represented in the big show at the Garden.

"Oh, the long horns from Texas,
The jay hawks from Kansas,
The plop-eyed bungaroo and giant giassicus,
The varmint, chipmunk, bugaboo,
The horned-toad, prairie-dog and ballyhoo,
From all the new-born states arow,
The fawn, prodactyl and thing-a-ma-jig,
The rakaboor, the hellangone,
The whangdoodle, batfowl and pig,
The coyote, wild-cat and grizzly in a glow,
In a miracle of health and speed, the whole breed abreast,
They leaped the Mississippi, blue border of the West,
From the Gulf to Canada, two thousand miles long:—
Against the town of Tubal Cain."

Yes, against "the town of Tubal Cain" and against also the Tammany Tiger, at first playful as a puppy, but soon snarling and showing his fangs, spitting viciously when backed into a corner or hard-pressed by the foe. It was the East versus the West, the wets versus the drys, the anti-Klans against the pro-Klans. And there were times in the scrimmage when these cleavages were not so easily discerned—times when the mob spirit obliterated lines, creedal and geographical.

The Democrats had not met in New York in National Convention since 1868, and the prediction seems warranted that another half-century will roll around before they go to Gotham again. Not that the Metropolis did not play the host to perfection. It did. It left nothing undone in the way of generous, lavish hospitality. From taxi driver to traffic officer, from bell hop to His Honor, the Mayor, courtesy prevailed. "Welcome" was everywhere. The one disturbing factor to the delegates from afar, and especially those from the South and West, was that Tammany Hall had carefully planned to stampede the Convention for its idol, Governor Alfred E. Smith. To this end Tammany summoned its cohorts by the thousands, trained them to the tiniest detail, then "crashed the gates," thronged the galleries and blocked the floors. In their ambition to name Smith for President at all hazards, his friends went too far, and by this token, some of the trouble of the most turbulent of conventions is accounted for.

I have been attending national political conventions since the Republicans met in Chicago in 1912, and religious conventions for a much longer period. I have been amazed at the politics which crop out in a church convention, and surprised at the spirit of religion as manifested at times in a political gathering. For instance, at New York, the only time that the convention was hushed and all talking ceased was when prayer was being offered. Whether the supplicant was priest, rabbi, or minister, the Garden was silent, and when the Lord's Prayer was recited, as was the case on a half-dozen occasions, thousands murmured in unison the familiar phrases.

The oratory of the Democrats at New York, with half a dozen exceptions, was dull, tedious and long-drawn-out. Of commonplace speeches, undistinguished in style and mediocre in thought, there were many.

Senator Pat Harrison's speech as temporary chairman made a hit with delegates and galleries. It was a good specimen of old-fashioned Southern oratory. The Senator coined some clever phrases, especially when he said that what the hour demanded was not a "Sphinx in the White House, but a Paul Revere, summoning the people to action." Yet there was a palpable crudeness in the intense partisanship of Harrison's address. He specialized too much in denunciations.

Senator Walsh, of Montana, is one of the ablest leaders in the country, and his conduct as presiding officer of the Convention was beyond praise. As permanent chairman, it might be said of Thomas J. Walsh what Adam Bede said of Moses, "He undertook a hard job and saw it through." The Senator is courageous. His mind works quickly and accurately, but he is not an orator. His speech, though abler in content than Senator Harrison's, lacked the brilliant delivery and popular appeal.

Franklin D. Roosevelt, in presenting the name of Alfred E. Smith, made a memorable speech. Mr. Roosevelt is a semi-invalid. He had to be assisted to the platform, and was obliged to use crutches. He was a gallant and appealing figure as he stood in the midst of that mighty throng, which was all set and primed for the most colorful and vociferous demonstration ever accorded a candidate. Roosevelt is tall and good-looking. His voice is pleasing; his accent cultured. He possesses charm of personality, and a Chesterfieldian grace. If Governor Smith had looked the country over (which he probably did) he could not have found a more magnetic orator to present his name to the Convention than Franklin D. Roosevelt.

On the whole, the women speakers excelled and outshone the men. Their speeches were brief for the most part, well prepared, and effectively delivered. The most eloquent was Mrs. Izetta Jewell Brown whose voice was clear and musical, and her speech, of some fifteen minutes in length, without a flaw. She seconded the nomination of John W. Davis, whom she described as "a man of the mountains." Some of her epigrams were particularly fine, as for instance when she said, "Mr. Davis is not so old as to be a man of yesterday; he is old enough to be a man of today, and he is young enough to be a man of tomorrow."

There were other orators. There was Bryan—but about him later.

Women's Display in Political Arena

WHAT about the women as politicians? Are political conventions bettered by the participation of the gentler sex? I think so. On the whole, the average woman delegate takes her duties more seriously than her husband, son, or brother. Not only so, but the women in the Democratic Convention out-averaged the men in intelligence, if appearances are a safe criterion. And as for loyalty, it is difficult to believe that the loyalty of the women supporters of William Gibbs McAdoo has been surpassed anywhere. They were indefatigable. Mrs. Antoinette Funk, fearing neither boss nor super-boss, marshalled the forces of her chieftain tirelessly until a hundred ballots had been taken. Mrs. Genevieve Clark Thompson, daughter of the late Champ Clark, piquant and possessed, was just as thoroughly anti-McAdoo, and also a fighter to the end. Yet, withal, there was something wholesome in the presence of the women delegates. And in those tense moments when passion ran at fever heat, I dare say it was the presence of the women that prevented many a physical encounter.

Through one hundred ballots, William G. McAdoo and Alfred E. Smith were the contending rivals—a new record, and one that will probably stand for a long time to come. If the former Secretary of the Treasury had kept clear of Mr. Doheny, his nomination would have been achieved on an early ballot. As it was, despite this handicap, he made a gallant fight against powerful opposition. As the balloting proceeded, McAdoo and Smith became something more than political rivals. They became symbols of two opposing groups, out of which emerged inevitably a religious issue. Had the convention been held elsewhere than in New York, it is improbable that this issue would have been so accentuated or intensified. Everybody knows that Governor Smith is a Catholic, and as far as that goes, even his opponents who have studied his political career would absolve him from favoritism on that score. Furthermore, the governor numbers among his warmest friends some outstanding Protestants, Franklin D. Roosevelt, for instance. On the other hand, Senator Phelan, who nominated McAdoo, is of the Catholic faith. And, in the interest of fairness, to go still further, one of the prominent Democrats who appeared before the Committee on Resolutions, asking that the Klan be not named, is also a Catholic. Yet, after these deductions and exceptions have been noted, the fact remains that the McAdoo-Smith conflict on the floor of the Convention, and especially in the galleries, was colored by the religious issue.

Throughout the Convention I tried to get the temper of the people first-hand, and mingled freely with delegates and spectators. I saw the McAdoo demonstration from a seat just back of the box in which Mrs. McAdoo and Miss Margaret Wilson were seated. I witnessed the Smith demonstration from a top seat in the top gallery, just about the best seat in the Garden for that purpose, too. I saw the great fight on religious liberty plank from the first floor where I was seated among the Alternates, and just across the aisle from the Georgia delegates. Inasmuch as the Georgians were under a constant raking fire from the anti-Klan faction, I studied them closely, and engaged three of them in conversation.

It was the general impression that the Georgia delegation was ninety-nine per cent pro-Klan, and I supposed that to be the case. The Georgians were the target for much good-natured chafing, and also for a good deal of bitter and occasionally vicious criticism. I know not how many times I heard these phrases hurled at that delegation, oftenest from the galleries and occasionally from the floor—"Where's your nightie, Georgia?" "Did you bring your pillow slips along?" "Where'd you hide your tar and feathers, Georgia?" The Georgians showed themselves to be good sports. They took the taunts good-naturedly. One of their number denounced the Klan from the platform and received a great ovation. His fellow delegates looked hurt and surprised, but they did not rebuke the deserter. They received him back into their midst without any demonstration whatsoever.

Mr. Bryan's Gleam of Oratory

I TALKED with one of the women in the Georgia delegation. She was a matronly looking soul, but there was a flash in her eye and a tightening of her lips in the more tense moments of the struggle. "Suppose," I inquired, "suppose the anti-Klan Resolution carried. What will happen to the Democratic party?" The Georgia woman lost no time in replying. "Kentucky will go Republican," she shot back at me, "Tennessee will go Republican. No longer will there be a solid South. We didn't raise this issue. New York raised it. It's a mistake, I tell you."

An ex-Congressman from a southern state whom I came to know fairly well, my seat-mate, by the way, through that long, eventful Saturday night and Sunday morning session, was even more pessimistic. Said he: "This looks like the end of the Democratic party. A fight on the religious issue will split us wide open. It will split us not only in the South but in other sections of the country." This ex-Congressman also informed me that there were between three and four hundred K. K. K.'s among the delegates. This gentleman, by the way, is not a novice in politics, and I am inclined to believe his estimate is approximately correct.

William Jennings Bryan was chosen to close the debate for the Majority's Report. The big crowd was not altogether favorable to his speaking, and order was restored with difficulty. Mr. Bryan looked old and worn and thin. But he put a marvelous amount of vigor into his twenty minutes' speech, and there were times when there was more than a flash of the irresistible Bryan of 1896. He pleaded for the acceptance of the Majority Report on the ground both of party and church unity; he held that the Catholic Church and the Jewish Faith needed no protection from the Democratic party. He affirmed earnestly that the Klan did not deserve the publicity it was receiving from the Convention, that the passage of the Minority Resolution would inject the religious issue into every Congressional election. Mr. Bryan was magnetic, eloquent and clever.

The vote was close, too close to be comfortable, or to satisfy either faction. The first figures given out gave the Majority Report the victory by one and one-half vote. Later this was increased to four, and finally to seven votes. The strong probability is that Mr. Bryan's speech saved the day for the Majority Report. If he did not make many votes for that side, he must have held scores of votes that would otherwise have gone to the Minority Resolution. Despite all that his enemies might say, Mr. Bryan was a power in the New York Convention.

A week of ballotings, and at last, on the one hundred and third ballot, John W. Davis, of West Virginia, wins the nomination. Quickly the choice is made for his running mate—Charles W. Bryan, of Nebraska, brother of the Commoner.

What of these candidates and the outlook for Democratic success?

John W. Davis is probably the most brilliant and distinguished of the younger leaders in his party. He is fifty-one years of age, highly educated, and at the forefront of the American bar. He is Wilsonian in appearance and qualities of mind—eloquent, scholarly, thoroughly likable. As member of Congress, solicitor general, and ambassador to Great Britain, he won distinction. He would grace the White House; he looks the part. The only fault found in him by his critics is that he is a Conservative, and identified with the banking house of J. P. Morgan. Immediately after learning of his nomination, Mr. Davis gave out a ringing statement in behalf of a liberal political program, and the

Government Agency Pays Its Own Way

U. S. Consular Service Proves That Efficiency Spells Success

By DIRK P. DE YOUNG

WILBUR J. CARR,
Director of the Consular Service, Department of State, Washington, D.C.

FOUR hundred and nine consular offices of the United States, located in widely scattered foreign regions, returned a net profit of $2,100,000 to the American people on their operations in the last fiscal year, 1922-23. It cost Uncle Sam only $4,700,000 to maintain its consular service in that year, whereas the fees collected, mostly from foreigners, at those offices abroad, totaled $6,800,000 for the period.

This is such a remarkable showing, in these days of high taxes, that a periodical which publishes the facts must make sure of its authority—to guard against libel and to protect itself from charges of sensational journalism. Consequently, the source of this extraordinary piece of news is no less a personage than the Director of the Consular Service himself, a very quiet and unassuming official, who has filled that position for fifteen years, at the same salary—$4,500 a year—one Wilbur J. Carr.

Mr. Carr has been employed by Uncle Sam in the State Department for more than three decades. He was employed as a clerk in the Harrison Administration, on probation, having served in that branch of the government work under eight Presidents, namely, Harrison, Cleveland, McKinley, Roosevelt, Taft, Wilson, Harding and Coolidge.

This official, who is the authority for the above profit and loss statement, being a diplomat, is not supposed to be quoted at all, and the quotation might even be denied later, but I shall then fall upon the mercy of the official stenographer who recorded Mr. Carr's statement—relating to the $2,100,000 profit in the consular service—at one of those rare meetings in Washington—a Congressional committee session.

How Candidates Are Chosen

A PROFIT, mind you, of over two million dollars—equal to fifty per cent annually—on the money outlay to support these four-hundred-odd consulates of Uncle Sam, overseas, employing a force of about three thousand workers in the wide, wide world from Aden on the Red Sea to Zurich in the Alps of Switzerland. A profit, not a loss, mind you again, from external revenues, gathered externally, in the process of which the average folk of America did not have to dig down into their jeans to produce it. Thus I quote Mr. Carr again, when I say that there is no other American Government service which can submit such a showing.

Along about 1906, the late Theodore Roosevelt, during his second term, somehow conceived the idea that consuls might be useful as well as ornamental. A great many foreign representatives of Uncle Sam in the nineteenth century, according to the late President Harrison, were sent abroad because they were not wanted at home.

Positions in our foreign service were not coveted much in those days. They were a sort of an afterthought—political jobs which deserving party workers would not take. Consequently, the flotsam and jetsam of an incoming administration, which could not crowd up to the pie-counter here at home, took the posts abroad, where they were out of the way at least for the time being. The consular personnel then changed with every change of administration. It was generally inexperienced and unfit. But Roosevelt, who was pretty handy with the "Big Stick," took a lively swat at that system, putting the consular service on the "merit system" basis, with Mr. Carr as the directing genius of the organization.

Quoting Mr. Carr again, as his remarks appeared in the extracts of the minutes of the aforesaid Congressional committee session, we get a slight glimpse of the revolution which has taken place in the methods of appointing consular officials now as compared to the days of the "spoils system." According to that gentleman, out of 100 candidates for appointment who took an examination recently only 12 qualified. It is about as hard to get into the consular service today as it was in Bible times for a "camel to pass through the eye of a needle."

The figures relating to examinations for entrance to the consular service, as just given, are quite illuminating, but there are others also which tell quite a tale. For instance, only 100 as already stated were designated (a Presidential selection of suitable candidates who may sit for the examinations) out of which only 12 were able to pass the test, physically, mentally, psychologically, or otherwise.

Many of the 100 who sought to qualify were perhaps smart enough in book knowledge, but a bad tooth, a bad eye, dull ears, lack of experience or breadth of vision, unbalanced judgment, or other disabilities caused them to fail. In addition to the 88 out of that 100 who failed, there were perhaps half a million hopefuls who for various reasons were not permitted to take the examination at all, even though they had applied in every language of the world, political as well as in the mother tongue. Indeed, I have seen a whole roomful of files, up and down the tall walls of the State Department, filled with thousands upon thousands of applications, from the halt, the lame, the blind, and the whole of the land, who have at some time or other offered their valuable services to Uncle Sam. But from that great mass of potential material, carefully culled out under the "merit system" of selection, the slender residue of 100 is chosen to take the entrance examination to the consular service.

Verily, under Mr. Carr's direction, during the past eighteen years, we have developed a consular personnel of supermen, almost, who pay for their own keep and besides produce an income of more than $2,000,000 a year—rubles, francs, Chinese taels, Indian rupees, florins, and pounds sterling, which those thrifty officials hoard up in their socks and send home to their Uncle Samuel.

There is a force of 2,773 under Mr. Carr's command. Of that number only 533 are officers of career, the others being vice-consuls not of career, consular agents, clerks, messengers, and others, with quite a number of women now entering the field abroad. In the London Consulate-General, which writes upward of 50,000 letters a year to Americans here at home, on every known subject, there is a staff of sixty workers; in Shanghai, Paris and Warsaw there are offices employing fifty each. Of all these people Mr. Carr keeps an efficiency record, noting their virtues or vices (it is claimed that they have now none of the latter) of each, which record he consults religiously before recommending promotions in the service. Even the wives of our consular officers, looked upon as diplomatic helpmates, have their strong or weak points recorded in the "personality morgue" of the American State Department. Indeed, a good wife is one-half of the equipment for the foreign representative of today.

The consular activities of the State Department carried on by mail, by cable, by radio, and by personal messengers, are extraordinarily numerous, although the American public knows little or hears little about them.

Mr. Carr is also on diplomatic etiquette, frequently being delegated by the President or the Secretary of State to represent the country on formal occasions. He knows precisely how many bows to make when he greets the Prince of Monaco or the President of a South American republic.

He also knows in what order to seat the guests, from the king down to the baronet, at a diplomatic dinner. Moreover, he can tell you what sort of regalia an American consul should appear in for special occasions in the South Sea Islands or in the palaces of the monarchs, if there are any left, in Europe. He has probably unwound more spools of diplomatic red tape in the last thirty-two years than any other American, with the possible exception of Adee, that veteran Assistant Secretary of State who has served Uncle Sam a few years longer.

Not long ago when Mr. Carr appeared before the Foreign Affairs Committee of the House, in behalf of his personnel, one of the Congressmen bluntly asked him what his salary was. Mr. Carr did not ask for a raise for himself, but he made a very eloquent and convincing plea for his staff which he pointed out was greatly underpaid, in spite of the fact that it was the only dividend-earning branch of the government.

The official in Washington who can show a statement not in the red today, with all this economy talk in the air, has got a decided advantage when he seeks a few extra dollars for his department. "Contented cows give good milk," Mr. Carr told the Congressmen, in so many words, not exactly quoted. "We want adequate pay for the men who comprise our field force. The consular service is now on a paying basis; the workers are entitled to their rewards," and he referred to the two odd million gold dollars sent each year by his thrifty crew.

President Coolidge, a man of few words, but a shrewd Yankee who can be fully trusted to get behind the government official who is providing the ways and means from foreign sources, summed up his support of Mr. Carr's program in the following sentence: "The Foreign Service of the United States needs to be reorganized and improved."

Personnel of Organization

THE consular field force of 533 career officers is classified as follows: Consuls-general 58; consuls-general-at-large 6; consuls 317; vice-consuls of career 135; consular assistants 11; interpreters and student interpreters 16. The salaries at present range from $1,500 to $12,000 per annum, with the majority averaging $2,500 yearly. Only 17 of the 533 get more than $6,000, while only two, the consuls-general at London and Paris, receive $12,000. The consular offices of the United States abroad comprise 48 consulates-general; 253 consulates; 18 vice-consulates; 88 consular agencies, and 2 combined diplomatic and consular stations.

A bill to reorganize the foreign service of the United States, providing for a higher salary scale and retirement on a pension, passed the lower house of Congress April 30, last. An identical bill is pending in the Senate, where favorable action is expected. It will require $250,000 more annually to operate the consular service if this bill becomes law—about 10 per cent of the net earnings of that branch of the government.

As the consular service is constituted today, the rewards are limited—salaries are barely sufficient to provide for decent living conditions abroad. Consuls are not allowed to engage in business or to practice a profession. Some of them are obliged to send their children back to the United States to be educated.

The new bill merges all diplomatic officers below the grade of minister and all consular officers of class 9 and upward into what will be termed Foreign Service Officers, with salaries ranging from a minimum of $3,000 to a maximum of $9,000, and an unclassified staff with incomes down to $1,500 as a minimum, providing almost exclusively for the Americanization of the service.

For administrative purposes, within the service itself, the term "consul, vice-consul, consul-general, or secretary of the embassy or legation" will be abolished. Such officers will instead be designated as Foreign Service Officers of class 1 or class 9, or to whatever of the various classes they belong. But abroad they will still be required to function as consuls or as secretaries to comply with international law. The advantage of this arrangement is the flexibility of the plan under which one of the highest paid officers, if necessary, can be detailed to one of the humblest consulates of the government, under stress of circumstances, without loss of grade or pay

This new bill creates a special fund to be known as "the Foreign Service retirement fund," five per cent of the basic salary of all Foreign Service officers eligible to retirement to be contributed to this fund. It provides for retirement of such officers at sixty-five, or sooner if disabled, but at least fifteen years of service must first have been rendered to the government. The annuities are to be paid to retired officers based on length of service and the annual average basic salary for the ten years next preceding the date of retirement.

A Wide Field of Usefulness

THE proposed measure also provides for a trip back to the United States, with the Foreign Service officer's whole family at government expense, once every three years. About thirty consular officers would be eligible immediately to retire under this rule, making it necessary to appropriate about half a million dollars for that purpose the first year. After that, it is calculated the "special retirement fund" would take care of annuities until about 1950, when, from then on, it would again be necessary for the taxpayers to contribute a small amount each year, 28 cents of each dollar paid out in annuities. However, on the present basis of earnings, these increased salaries plus any necessary outlay for old age pensions, are only a small part of the net profits of the present consular operations of the government.

The director of the Consular Service has shown his ability to select good men for his field force, from which he has also got exceptional results—witness the $2,100,000 net earnings last year—but he is not so sure that he can hold them, resignations recently of some of his best men—young men who were afraid to face old age without better prospects—being looked upon as a sign of discontent with the pay and the prospects of a foreign service career.

The work of consular officials is of a wide scope. They visa passports, certify invoices, perform notarial services, look after the estates of deceased American citizens who die abroad, issue bills of health to vessels departing for the United States, and promote American trade. The latter function is perhaps the most important one today, although the revenues arise from the former duties. The Department of Commerce has only a handful of men in the foreign field compared to the consular force.

Mr. Carr states that he transmits 20,000 trade reports monthly, received from consuls, to the Department of Commerce at Washington. In addition to that, hundreds of thousands of letters on commercial subjects pass through the State Department from consular channels to business men throughout the United States. Many of the first connections of American concerns in foreign lands are opened up through the good offices of an American consul, an official who is at the command of 110,000,000 Americans for any service within his consular district at any time. But few people here at home have a clear conception of the scope of a consul's reach and ramifications.

In view of the widely scattered personnel of the consular service, it is remarkable that it is conducted on such an efficient business basis—paying dividends, as it does at the rate of fifty cents on each dollar of capital outlay, yearly. It is also remarkable that a man can be found anywhere in the United States capable of organizing and directing such a large government enterprise on a business basis at a salary of $4.500 per annum, bringing the American consular service up from the worst in the world, operated at a loss, to the most efficient among the nations.

Potato Growers Beat Sapiro at His Own Game

$2,000,000 Crop Regained After Organization by "Cooperatives"

By ROBERT MORGAN

ERSKINE R. MYER.
Who saved situation for farmers.

OUT in Colorado, 2,000 farmers grow some 2,700,0000 bushels of potatoes, worth in the field somewhat more than $2,000,000. Aaron Sapiro, the firm of Weyl & Zuckerman, and T. W. Chamberlain, an attorney of New York, obtained, in 1922, control of this potato crop. In 1923, they lost this control and were compelled to make settlement with the farmers to the full value of the crop. Sapiro and Weyl & Zuckerman were ousted from all participation in the marketing of the Colorado potato crop; while the potato growers' association now has $60,000 to its credit in the bank, has arranged for financing its own crop this year, and control of the organization is entirely in the hands of the members.

This result—probably the greatest recorded by any state co-operative marketing association ever under Jewish control in this country—was accomplished by four men. These men were Erskine R. Myer, a young but prominent attorney of Denver; M. I. Chenoweth, W. D. Moore and J. P. McKelvey, directors of the Colorado Potato Growers' Exchange. Two other members of the board of five directors, C. A. Finch and T. W. Lytle, supported Sapiro and his plan.

The history of the Sapiro misrule in Colorado starts in May, 1922, when the 2,000 potato growers of the state were organized into 21 local co-operative marketing associations, and soon welded into one state association, called the Colorado Potato Growers' Exchange. Mr. Sapiro previously had obtained the passage of the Senate bill authorizing the organization of such associations, and both bill and plan were similar to the bills and plans presented by Sapiro in other states and previously described in these articles.

Each farmer paid $5 enrollment fee into the association. This enrollment money, through the watchfulness of some of the members of the associations, apparently went into the general funds. In other states the fee has been $10 and all of it went to the enrolling agents, W. S. Hill, of Greeley, Colorado, organized the local associations, but the merging of them into the state exchange was left for the master mind of Aaron Sapiro, and his New York attorney, Chamberlain.

Sapiro, who was then in New York, retained Mr. Myer, by wire, to act as local attorney for the state organization. As in all the other state associations, Sapiro employed himself as "supervising legal counsellor" at a salary supposed to be fixed by the directors, but which has resulted in the gentleman from San Francisco bringing a suit for about six thousand dollars against the potato growers, as fee for his services. Of this suit and the fee Sapiro has fixed for himself, more later.

Soon after the completion of the state exchange, the directors of that organization found themselves in an argument with Weyl & Zuckerman, independent potato buyers and distributors. This firm are the sales agents for Sapiro in whatever associations he can compel to employ them. The directors learned that the contract which the state exchange had with Weyl & Zuckerman was drawn to protect only the distributor, not the producer of the potatoes. These distributors had approximately two million dollars worth of potatoes spread all over the country; the producers were in complete ignorance as to the whereabouts of their potatoes, and were *receiving no money* in return for the delivery of their crop to Weyl & Zuckerman.

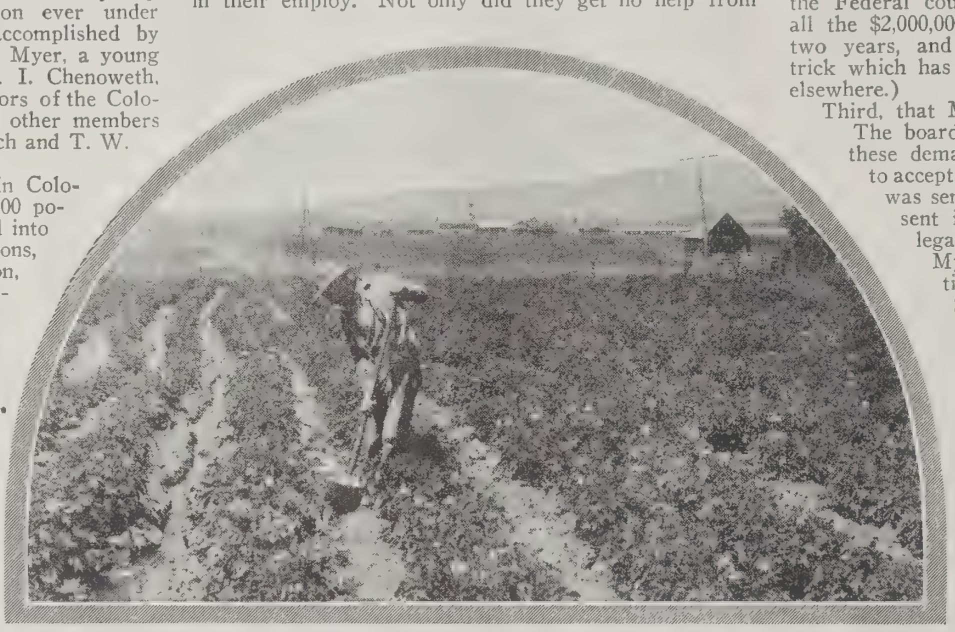
It is interesting to note at this juncture, that the Sapiro co-operative association had agreed to pay Weyl & Zuckerman a flat commission of $21.50 a car for selling these potatoes. Now, Weyl & Zuckerman also were handling potatoes from independent growers, for which they had paid cash. Which potatoes would Weyl & Zuckerman sell first, those in which they had their own money tied up, or those in which the time, money and labor of the farmers were involved? Beyond this, the actual profit to Weyl & Zuckerman on a carload of their own potatoes was approximately fifty dollars.

Weyl & Zuckerman had agreed, in their contract with the potato growers, to advance a total of $450,000 on the farmers' notes, with the farmers' farms pledged as security, at eight per cent interest. Eight per cent on $450.000 is $36,000.

But, when Weyl & Zuckerman had advanced about $75,000 to the potato growers, and after this firm had in its hands *all the bills of lading* for this $2,000,000 crop, they refused to advance any more money, or to pay the farmers for the potatoes now completely under control of the firm. Then Aaron Sapiro appeared again on the scene, leading by the hand Morrison Shaffroth, son of a former governor and former United States Senator, and, more important than all the rest, attorney for Weyl & Zuckerman. Sapiro tried to force Shaffroth into the position of attorney for the Colorado Potato Growers' Exchange, the state organization, but the three sturdy directors already mentioned refused to accept Mr. Shaffroth, and he dropped back into his doubtless lucrative position as attorney for Weyl & Zuckerman.

It was then Erskine Myer's turn at bat and he went for Weyl & Zuckerman with the threat of a suit based on the possession of the bills of lading for the $2,000,000 potato crop, and the contract by which they had agreed to advance $450,000 to the potato growers. As soon as this young American made it clear that he meant business, Weyl & Zuckerman beat the usual Jewish retreat, sold off the potatoes, paid themselves for the job, and turned the balance over to the members of the association.

Meanwhile, the potato growers through their board of directors had telegraphed repeatedly to Aaron Sapiro, asking for his advice and assistance, since they were paying him for his services, and supposed that he was in their employ. Not only did they get no help from their "supervising legal counsellor," but they could not even get replies to their telegrams. This is the same condition in which virtually all the Sapiro-organized co-operative associations have found themselves, once they have contracted with the gentleman from San Francisco for his legal abilities and time. The association directors afterward learned, however, that every time they telegraphed to Sapiro, Weyl & Zuckerman also communicated with him, telling him a different story. Astounding as it may seem to the uninitiated, it appears that Jewish influence is stronger with Mr. Sapiro than are the claims of the clients who are paying him for his services.



Irrigating part of Colorado's annual potato crop of approximately 2,700,000 bushels of potatoes. This scene is on the Great Divide Community Colony at Hayden, Colorado.

Ten thousand dollars worth of potatoes on a farm near Greeley, Colorado.

In November, 1923, Mr. Sapiro appeared suddenly in Denver, accompanied by T. W. Chamberlain, an attorney of New York. In the Colorado city, Sapiro met with the executive committee, the directors, of the Colorado Potato Growers' Exchange. Mr. Erskine R. Myer, who had been retained by Sapiro as the attorney for the exchange, under the impression that Mr. Myer was a Jew, was absent from the first session of this meeting. Sapiro appeared before the directors with a copy of the supplementary contract which had been drawn up when Mr. Myer forced a settlement from Weyl & Zuckerman, and tried to tear this contract to pieces, meanwhile attacking Mr. Myer.

In the afternoon, Mr. Myer appeared, and in his presence Sapiro calmed down, said nothing against the attorney, and was badly worsted in an argument with Mr. Myer on the merits of the supplementary contract. When the first opportunity offered, Chamberlain called Mr. Myer aside and said:

"It appears that you cannot get along with the 'Chief,' and it will be necessary for you to resign."

Mr. Myer replied:

"Very well, I will resign, if the board will accept my resignation, but I will not resign at the request of you or Sapiro, nor will I resign until both of you have left town."

With this, Mr. Myer returned to the room in which the board of directors was meeting, and notified that board that he would resign. Thereafter, he went before the board and laid down charges of fraud against Sapiro. The board thought so much of these charges that they refused to accept Mr. Myer's resignation. Sapiro, then, in a further effort to complete his control of the situation, which was threatened and eventually overthrown by the doughty Myer, demanded three things:

First, that M. I. Chenoweth, secretary, be appointed "nominal" secretary, and that an active secretary and financial manager be appointed.

Second, that the exchange sever all connection with Weyl & Zuckerman, and start suit against this firm in the Federal court. (This action would have tied up all the $2,000,000 due the potato growers for at least two years, and was a typical Jewish "co-operative" trick which has been worked before, in California and elsewhere.)

Third, that Mr. Myer be discharged immediately.

The board not only refused to accede to any of these demands, but adopted a resolution refusing to accept Mr. Myer's resignation, a copy of which was sent to Sapiro. Three weeks later, Sapiro sent in his own resignation as "supervising legal counsellor." To clear the slate, Mr. Myer resigned again, and both resignations were presented to the board. The Sapiro resignation was accepted immediately and the Myer resignation unconditionally rejected. But that was by no means all.

When this battle was over, the Colorado potato growers emerged—due to the tireless work of Myer, Chenoweth, Moore and McKelvey—with all the crop paid for, the advance from Weyl & Zuckerman included; with $60,000 in cash in the bank, and with the financing for this year arranged for. More important than this, they were rid of both Sapiro and his famous sales agency, Weyl & Zuckerman. The growers themselves will distribute and sell this year's crop, paying themselves the $21.50 a car which they paid to Weyl & Zuckerman at Sapiro's suggestion. That is to say, the $2,000,000 crop of 2.000 potato growers of Colorado is out of the hands of the Jewish ring, and the manner in which it was taken from their control is worthy of study and emulation by the members of the other Sapiro-Plan co-operative marketing associations of this country, for it can be applied to every other commodity produced by the Americans who are being exploited by this Jewish organization, from asparagus to wheat.

But Aaron Sapiro is still in the fight in Colorado. When he was in the first effort of organization of the potato growers, after the bill had been put through which enabled him to throw and hogtie the farmers, Sapiro said to the board of directors:

"I am doing all of this work for the benefit of the farmers of America in general and the farmers of Colorado in particular. Whatever your board fixes as my fee for this service will be satisfactory to me."

No sooner had the money for the potato crop been wrung from Weyl & Zuckerman, however, than bills from the Sapiro end of the affair began to come in. Chamberlain was on the ground floor with bills for "expenses." So long as these bills remained within reason, they were paid, but when one for $400 was presented, Mr. Myer objected, and asked for an itemized statement. The reply was that $5,000 and expenses had been agreed on as the fee. This was the first news that the directors or the potato growers had had that any fee at all had been agreed on, and the three directors who had helped Myer save the situation said so in no uncertain terms. Soon came a letter from Aaron himself, in which he said:

"I have heard that the board of directors has been informed that my fee for services to the Colorado Potato Growers' Exchange is ten thousand dollars; this is unauthorized, as my fee is five thousand dollars."

Thus did Aaron Sapiro, after doing nothing for the Colorado Potato Growers' Exchange except "sell" them the Sapiro Plan, and after ignoring their repeated demands for the legal services for which they were paying him, fix and collect his own fee of $5,000 for the services he had not rendered. More than this, he, through his henchman, Chamberlain, had collected, and was seeking to collect, additional expense moneys, bringing the total to be paid these two up to $6,000 or somewhat more. Truly, as the writer has said in previous articles, it costs money to know Aaron Sapiro.

The demand for an itemized bill which the potato

(*Concluded on page 14*)

Mr. Ford's Page

WHAT many have foreseen has occurred: the business mind has taken hold upon the political imagination of the country. In each major party the practical type of mind has been recognized; not merely the type that promises to be practical but the type that actually has had business practice. Time was when a man who had accumulated a few hundreds of dollars was under suspicion of having had something to do with the "interests." The so-called "interests" of the time was almost anyone who had a little working capital and was employing it usefully instead of throwing it broadcast in an empty and short-lived gesture of humane kindness.

It was perhaps inevitable in the years following the Civil War, when a new expansion of the American Idea was under way, that those who secured for themselves the first material rewards and used them selfishly, should be labeled as characteristic of a class. To possess anything at all was to be ranked with those who were somehow lacking in social-mindedness. From that idea grew most of the thunder which served politicians for fifty years.

THE affairs of the United States are big affairs. Bigness trains big men. Contests in this nation are no longer between men of little affairs and men of big affairs. The contest now is between men of big affairs, one type desiring to use big enterprises selfishly or for the interest of a few, the other type to use big business and big finance and everything else for the interest of the many. The division line may be roughly drawn in the words Finance and Industry. Both fields breed big men. Industrialists have rather outstripped the others because in industry the only idea which can win out is the constructive and serviceable idea. These are principles to keep in mind in the present political contest.

Only one good discovery was made during that period—only one, and that was discarded because the men who stumbled upon it were politicians instead of statesmen. Men can be traced all down the record who clearly saw that the money system of the United States, admirable as it was in its flexibility, sufficient as it was in the liberal use made of it, nonetheless lent itself to the manipulation of specially trained men who were not of the constructive type but the trading type of mind. After one has read the story of our political thought and has weeded out mere soap-box type of mind who railed against money simply because it was money, and against monied men for no other reason than that they knew how to obtain, control and use money, one still bears clearly in mind that there have been men who saw as statesmen the meaning of the money system to the nation.

And some of them saw so clearly that this question was not the way to political preferment, that they quickly dropped it! There is Mr. Bryan for example. He came before the public, won his first introduction to the world on the money question. Not only has he not followed it up, but from all indications he has even ceased to be interested in the subject. This is not a personal criticism of Mr. Bryan. He may have found himself beyond his mental depth. He may have felt he could not afford to sacrifice for an unpopular cause, or one whose triumph would come beyond his days. Whatever the reason, it was doubtless sufficient to himself. But the fact remains that he was the last great popular candidate to make the money question national in the philosophic sense. And now even he is silent on it.

But, the ways of the development of life are strange, and though no candidate dare bring up the money question any more, no campaign has been waged on anything else. Heretofore it has been assumed that the Republican candidate for the Presidency was the servant of the "interests" (whatever they were) and the Democratic candidate was the servant of the men who carried their dinners to work in a tin pail.

It was all a sort of survival of the old idea that life in this land is to be fought out between those whom we call the "poor" and those whom we call the "rich." Emerson had said that "man was born to be rich." And his saying came true in America for millions of common people. There was a time in this country when a man who had accumulated a little money liked to advertise it by ostentatious social display. Then the time came when the men who were doing the real tasks of the country had to secure money in sufficient amounts to finance the massive works which the needs of the country require—money ceased to be an ornament and became a commodity.

Just at that point, money which had been merely money before, became the symbol of two diverse forces in life. The first was money as Money. The second was money as Medium. The slogan of one was "Money is everything." The slogan of the other was "Money is a means."

To put it more bluntly: there arose the *financier* and the *industrialist*.

For many years in the United States the financier had the upper hand of the industrialist.

The manufacturer, maker of things, was counted as a grade or two lower than the financier, who gambled in the signs of things.

Laboring men formerly called their employers "capitalists" because they did not know that their employers had to climb up a step before they could get "capital" from the "capitalist."

How long the employers, the managers, the manufacturers of America bore the stigma of being "capitalist"! Until the time came when to have a hundred dollars or to be competent to manage a business almost threw you out of one political party into another.

That time is past. Emerson's saying has sunk down into the American mind. All of our people were born to prosperity, and now even the Democratic party can nominate a man who is not unacquainted with money in excess of two dollar bills and who has been connected with the management of business larger than a campaign picnic.

What does it mean? Well, first, it means that some people are going to ask, "What's the use of voting? The money crowd has got both candidates!"

Aside from the possibility that the money crowd did not like Mr. Coolidge at all, and may be very glad to have Mr. Davis as an acceptable alternative, there is this to consider: We are past the time when a man of affairs represents Money. Remember that Industry and Finance are two things. Twenty years ago the popular complaint was directed against "Big Business." We had no very big business then. What we meant was the financial group that lent money and kept their hands on business. We simply must distinguish between finance and business to understand the situation today. We must draw a line between speculative banking and industry; between money brokering and making commodities for the people's use.

If a man represents "Big Business" today, he represents jobs and wages and steady service.

But if he represents finance, that is quite another thing.

It may be that this is the campaign in which these distinctions are to be made plain.

There will be difficulties. People have been so accustomed to slogans that mean little or nothing, that they are impatient of looking into the elements of a situation. In one way, two men like Coolidge and Davis can be lumped off in one lot; both of them have been sober straight business men; neither has ever whooped on the soap box or promised to bring the millennium to Ward Eleven if he was elected alderman. And their nomination, proving as it does the recognition by both parties that we have become a nation of large affairs, may be just what is needed to enable the nation to draw the finer distinction, namely, that which exists between the servant of Big Business and the servant of Big Finance. One means the shop and the job, the other means the speculator and profiteer.

A second meaning of this nomination is that as a people we are about to learn that a man's being in this stream of tendency or that stream of tendency does not reflect on him as a man. Our national progress is determined by the stronger current as modified by the lesser current. The streams of tendency which they represent are made by the people themselves and will modify one another until the right direction is found.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Polluting the Stream

NO MORE effective method for the undermining of religion and morals can be found than through the medium of the motion picture. Bad books are, and always have been, a great evil, but the motion picture film, if its mission is perverted, is an infinitely more powerful factor, for while in the book the reader has to form his own mental picture of the scenes in the story he reads, in the film there is nothing left to the imagination.

Put to a proper use, the motion picture would be a great power for good, but its prostitution is perhaps the greatest evil that could befall any country, for its influence is infinitely greater than the printed page, the platform or the pulpit; it exercises an attraction which none of these possesses, and, more's the pity, for every person that will attend a church or seek the cultivation of his intelligence at the lecture platform, there will be found a score who will flock to the "movies."

Healthful, wholesome pleasure is all to the good when kept within due bounds and enjoyed at the proper time, but the perversion of mind and heart, the insidious wearing away of moral stamina and will power that so frequently pass under this designation, is the poison that kills, the sinister influence that turns the fairest fruits into Dead Sea apples.

In a book recently prepared by Canon William Sheafe, D.D., of Brooklyn, there is presented a powerful indictment of the demoralizing effects of bad picture films. True, there is a state censorship of picture films, but this so far has proved neither adequate nor effective. Its principal weakness lies in the fact that the objectionable features are cut out of the films after they are made. What is wanted is that when the pictures are being filmed they shall be in conformity with the recognized standards of morality; those standards which are essential to the well-being of every Christian nation.

When exception is taken to an evil picture, at least two years must elapse before the picture can be suppressed in any state by ordinary legal process. As a matter of fact, court proceedings only aggravate the mischief that is being done, on account of the extra publicity given to the objectionable film, and people flock to see it in still greater crowds, many of them drawn by mere curiosity. Thus there is an aggravation instead of a mitigation of the evil; and so the matter goes on.

That there is need for new state and Federal laws to regulate the movies, there can be no manner of doubt. Urgent measures are required to put an end to a national menace, and the sooner such measures are drafted the better.

It appears that five or six producers, who are not actuated by the highest American ideals and principles, control the motion picture industry in this country. While we do not accuse these men of a wilful endeavor to pervert the moral standards of the nation, their culpability in exhibiting for profit scenes and phases of life transgressing the moral law cannot be questioned. The hectic character of some of these productions is most unwholesome, their effect is pestiferous, and youthful minds in particular are susceptible to their influences. More harm can be done by one evil film than by millions of bad books, because the effects are more vivid and much more lasting.

Why should not such an instrument, so potent in its effects, be turned to its legitimate uses by stripping it of its filthy trappings and clothing it in something that is clean and wholesome? "But," say the producers, "the public wants this sort of thing; if we did not cater to its tastes in this direction we might as well close all our picture houses." Then close them. Better to do this than that this hideous thing should continue. But there is no need for this if sane methods are pursued.

The people have the "movie" habit, and one does not hesitate to say that if the right kind of films are substituted for the garbage that so frequently passes muster, there would be no falling off in their patronage. Historical films, when properly studied and adequately staged, are always attractive, and picture stories from good books never fail to draw.

As already pointed out, this matter ought to be attended to at its source, for only in this way can the contamination of the stream be prevented.

The President's Son

THERE has been laid to rest beneath the green turf in the little cemetery at Plymouth, Vermont, the youngest son of the President of the United States.

Young Calvin Coolidge fought a brave fight against an insidious foe, which often baffles the best efforts of medical science, but was cut off at the bright dawn of his career.

Words are inadequate to express the sympathy which the whole nation feels for the bereaved parents, or to extol the manliness of the boy, but the President and Mrs. Coolidge must have felt the genuineness of the nation's mournful interest.

The President, with that sanity of spirit which he has inherited from his New England ancestors, wisely discouraged any ostentatious display of grief, an act of good taste generally appreciated.

What Is a Gentleman?

"MANNERS Make the Man" is an old and a true saying. There is a certain school building, it does not matter where, along the front of which is inscribed in letters of gold the words: "Religion and Good Manners." A very good motto, some people will say, and they let it go at that. But others may remark: "Are not religion and good manners one and the same thing; does not one embrace the other?" This latter thought is a very natural one, but the two do not always go together; for example, outwardly a man may have manners which according to worldly standards are above reproach, but inwardly he may be anything but religious.

On the other hand, a man may be religious in the very best sense of the term and yet have manners that would shock a South Sea Islander. Was it Dr. Samuel Johnson who was asked: "What is a gentleman?" "Why, sir," replied the great lexicographer, "a gentleman is a man who is gentle."

There is a power of meaning in this simple reply. To be gentle is to have consideration for others, to have consideration for others is to be unselfish, to be unselfish is to possess the spirit of self-sacrifice, to possess the spirit of self-sacrifice is to possess one of the noblest attributes of which mankind is capable.

Courtesy, it is often said, costs nothing; but this is not always true. Courtesy sometimes costs much; it sometimes requires the exercise of a large measure of self-control, and this self-control is not always forthcoming. The man who can exercise self-control under adverse circumstances is a hero; he is more, he is a gentleman.

One sometimes wonders whether a course in courtesy would not be a good thing for some of our public officials; whether the inculcation of the precept, *"Suaviter in modo, fortiter in re"* (gently in manner, strongly in deed), would not be good policy. Even politicians and their followers might benefit by such a course. Consider, for example, what an immense influence it would exercise on political and all other conventions. There is no doubt that the greater the shouting the less the sense.

It is only when the stream is untroubled that the waters flow clearly, and in like manner it is only when self-control is exercised in the things of everyday life, that good sense and good fellowship are preserved.

It Is the Day of Men of Affairs

THE Democratic Convention did a stroke of business at the end, which only the inside managers could have foreseen. In a measure it redeemed itself from the immeasurably bad impression which certain prolonged exhibitions of bigotry had made upon the country. It may be that the whole convention will justify itself in futurity's view as having been the forum in which bigotry was fairly met and whipped. For certainly it was whipped. And as if to rub it in, a Bryan was added to the ticket.

The decency of the ticket finally nominated gave the first intimation that the coming election is to be more of a real contest than was expected. The ticket of Davis and Bryan is not to be despised. It is not the choice of the Democratic party as that party was represented at the Convention, but it does approximate the choice of that newer democracy which refuses any longer to regard the party as representative of economic failure. To have more than a dollar and a half once disqualified a man from being a good Democrat. Now they have nominated a man whose brain moves easily in big affairs of practical business importance. Mr. Bryan, they say, has accumulated a competence; but he has not done so in the realm of affairs; he is a good man, but he hasn't created any jobs for people, and he hasn't been actively connected with enterprises which are responsible for creating and protecting jobs. He has profited by his personal talent, personally exercised.

It is easy to understand how a man like Mr. Bryan, good as he is should fling the taunt of "Wall Street Servant" at Mr. Davis, good as he is. One represents the old democracy of a dollar and a half limit, the other the newer democracy of millions. The Democratic party can live only by showing that it contains as many managerial brains as the Republican party, and it can win only by showing that its managerial brains line up with Industry rather than Finance.

The wisdom of the Democratic Convention in its last hours rests in this: that instead of pitting a politician and a rhetorician against Coolidge and Dawes, it chose men who are somewhat trained and experienced in big affairs. The old taunt against Democracy is to that extent removed.

Walsh would have been a good man on the ticket. Unanimous in nothing else, the whole convention—Klan and Clan-na-gael—agreed that Walsh was a great chairman, and never greater than when he heard the still small voice of the minority and mistook it for the majority. The party owes Mr. Walsh more than it will ever understand (unless it reads the stenographic reports) for his ability to rise above the prejudice which at first confidently looked upon him as its ally.

So, the campaign is on. It is not going to be much of a campaign, by all accounts. But it will be more of one, because of Davis and Bryan, than it would otherwise have been. There will be more money spent, for one thing. The candidacy of La Follette is too young to be appraised. He of all the candidates represents politics—pure and simple politics. He is not a man of affairs. A useful man, without question. A man of valuable service to the nation in maintaining a degree of reality in senatorial affairs. But in the end, an expert in the realm of politics. It will be interesting to observe whether his political appeal will cause even so much as a flutter in the face of the other tickets' practical appeal. It seems to be the day of men of affairs.

Impotence of "Vox Populi"

CALIFORNIA, the state of more varieties of climate and favorite sons and other things than sister states can boast, assumes a negative importance in her limitations of the franchise. It is claimed the La Follette ticket cannot have a printed column on the official ballot, but that members of his party must write in the names of his electors in a blank column on the ticket.

No matter what Senator La Follette's position in the Presidential race may be, there is no sane reason for legal restrictions which prevent his supporters from indicating their choice with the same facility that other voters do.

Cumbersome laws for the preservation of the purity of the ballot go much further than necessary, and frequently infringe on the right of the voter to find his ticket ready for him when he visits the polls; but such a law as that reported from California might easily decide an election in favor of a man the people would repudiate.

Is Federal Control of Schools Desirable?

The Danger of Lobbying by Bureaucrats and Cliques

By AARON HARDY ULM

> Whether an American child attends good schools depends largely on the accident of birth—that is, on whether it lives in a community wealthy enough and enterprising enough to support good schools.
>
> There are many communities which lack the enterprise; some lack the means.
>
> While some states are poorer than others, not one, say persons who have studied the subject, is too poor to see that all of its children have opportunity to attend good schools.
>
> Unscientific state aid involves complications and dangers which would be much augmented by Federal aid. As a rule, the best schools are in those states which provide out of their treasuries the smallest proportions of money spent on schools.
>
> There is much that the states can do in equalizing educational opportunity, and in fact much progress in that direction is being made by them.
>
> This and other phases of the subject are discussed in this article dealing with facts bearing on the proposition that the Federal Government launch a program of national education.

THE two Smith brothers own farms and are rearing their children in adjoining communities in the same county of a certain state. One community is known as Overton and the other as Marshall district.

The little Smiths who live in Overton district attend good schools, taught by well-trained and well-paid teachers, conducted for long terms in excellent buildings.

Their cousins in Marshall district attend schools conducted in shanties, and are taught by poorly paid, untrained youths for only short terms.

Why should the children in Marshall district be denied good schools when those in Overton district have them?

This condition is confined to no section, not even to any state, though it is more prevalent in some than others.

There is considerable difference in the average of schools in different states. In 1920, for instance, Arizona spent an average of $136.56 for each pupil, while South Carolina spent only $19.99.

In New Jersey, the average length of the school term was 189 days; in Mississippi it was only 122 days—a difference of three school months a year. These variations between the schools in different states extend to all the particulars of education.

Yet there isn't a state without first-class schools, nor one without poor schools.

Variations in school facilities *within* the same state will sometimes run to greater extremes than between the averages of the different states.

In one county of Arkansas it was found that the school term averaged 168 days; in another, only 77 days.

In a single township in Pennsylvania seven one-teacher schools were conducted for only seven months in the year by teachers receiving only $45 a month each.

States Able to Provide Good Schools

IN NEW YORK State there are nearly 9,000 one-teacher schools.

These variations are due to many causes, the chief one being the highly localized character of the common schools. Some communities are more progressive than others, some financially abler.

Insofar as financial support goes, the fault is not with the state governments.

As a rule, though not uniformly, the best average schools are found where states give least financial aid to the schools. In Iowa, whose illiteracy rate is the lowest for the country, the state government in 1920 supplied only two-tenths of one per cent of all funds going to common schools. In Montana, whose schools by Ayers' rating rank highest for the country, the state government furnished only three-tenths of one per per cent of the funds. In most of those states whose schools rank the highest, the degree of local community support also is the highest.

Greatest progress has been made by all the schools since 1890. The percentage of school revenue derived from local taxation increased, for the country as a whole, from 68 to 83 between that year and 1920. This does not include county taxation.

In most of those states whose schools rank lowest the proportion of state support is highest. But in the South, where state support has been predominant, the percentage of local support has increased as the schools have improved.

No student of the subject, however, contends that the maintenance of schools or any other phase of education should be wholly a local community affair. While local initiative and enterprise account for most of the progress that has been made, excessive localization has produced many inequalities and caused much stagnation, such as typified by the average one-teacher school.

The district system enables a community to cut itself off and conduct its schools independently of and often partly at the expense of other communities.

Through Overton district, mentioned above, a railroad runs. Hence its school taxes are paid in great part by the corporation which owns the railroad. Marshall district, cut off from this special aid, has poor schools. The arrangement is patently unfair to Marshall district.

City schools generally are better than rural ones but city wealth is drawn from rural districts.

In one Colorado school district there is taxable wealth amounting to $26,445 a child; in another, the taxable wealth amounts to only $617 a child. In every state in the Union like differences between abilities of communities to support schools exist.

They also prevail as between the states. The taxable wealth behind each school child in New York State is several times that behind each one in Mississippi.

But, while certain *communities* are unable to support first-class schools, there is not a single state that is unable. Every state is able to see that every community presents an equal public school opportunity to every child. It is primarily a matter for the community, then for the state. It should not need to get so far as the nation.

In scarcely a case has state aid been provided scientifically or equitably. Usually state school taxes are distributed according to school population, with the result that communities that do not need it are helped as much and sometimes more than are those communities which do need help.

Connecticut was the first to provide state aid for the schools. In 1795 that state established a permanent school fund from which "to pay in full the wages of common school teachers and so relieve the towns and school societies almost entirely from local taxes."

"The school fund of Connecticut became a notorious example of a magnificent endowment creating educational disaster," says Professor Fletcher Harper Swift in a bulletin recently prepared for the U. S. Bureau of Education.

The communities which, as elsewhere in the country, had provided wholly for their schools, ceased to give local support, looked to the state for all funds which they freely wasted, and the schools deteriorated. Connecticut now provides out of its treasury only a small portion of the funds spent on schools in that state.

In some of the southern states the development of schools no doubt has been retarded by too much or misplaced state aid. In several of those states numerous communities still look to the state governments for all of their school funds. Thus local initiative is deadened, funds so easily procured are not always expended with care, and true progress is impeded.

For all the states still leave all important matters of school management to the counties or local communities.

A commission which recently inquired into the rural school problem in New York State said in its report:

"The state school department is too remote from local communities to supervise their activities."

Yet today some of these activities, notably those having to do with Federal-aid vocational education, are supervised in great part from as great a distance as Washington.

Regarding this form of present Federal aid to the schools, Lorraine Elizabeth Wooster in a report, as superintendent of the schools of Kansas, said:

"After Kansas contributes her funds to the Federal Government Kansas is then told what she must do, how she must do it, and when she must do it, to get any of this money back. She must agree to use this money within a certain time for certain purposes and under certain conditions, and must do certain things before any money is turned back to the state. For fear that Kansas does not comply in all Federal requirements, a number of inspectors and supervisors are sent to see if Kansas is meeting the requirements in every way. The Federal supervision and inspection furnishes positions for a number of men and is quite expensive. Kansas pays the bills."

Incomes and Expenditures

THE New York commission inveighed against the school district system now prevalent in that state and recommended the adoption of a more comprehensive administration and supervision. Yet the commission said:

> "It must be recognized that a county in most cases is too large for the administration and supervision of so intimate an institution as the school."

A state and most counties too large for handling the problem safely and yet many people demand supervision from Washington!

Yet there is much that the states can do, and no state is too poor to do it.

Expenditures for schools in all the United States averaged $2.76 a year in 1918 for each $1,000 of taxable property. A great many states exceeded this average. All but two of the "poor" states of the South spent less than the average on this basis. Kentucky and Tennessee alone of the southern states exceeded it.

But before you condemn the southern states remember this: Between 1890 and 1918 increase in school expenditures per pupil increased 195 per cent for the country as a whole; increases in all but three of the southern states exceeded this average for all. And greater increases have been made lately in those states than probably in any others, though many thoughtful Southerners doubt sincerely if education of the merely bookish kind is helpful to a great proportion of their large Negro populations.

One has but to note comparisons to see that there is little necessary relation between the distribution of national wealth and educational opportunity.

North Dakota, which in 1920 ranked *twelfth* in wealth and *thirty-fifth* in income, *ranked fifth in school expenditures* per child.

Utah, which ranked *twenty-first* in wealth and *thirty-fourth* in income, *ranked seventh in school expenditures* per child.

On the other hand, Delaware, which ranked *fifth* in per capita income, ranked *thirty-fifth* in expenditures per school child.

Numerous and even more extreme illustrations like the following might be given: In Grant County, Oklahoma, per capita wealth amounted to $9,022 and expenditures per school child to $71.79 a year. In Carter County, Oklahoma, wealth amounted to $3,284 a person yet $71.59 was being spent on schools when these statistics were formulated.

"The entire history of the subject shows that you cannot impose education on either individuals or communities," says a Bureau of Education specialist who has studied the problem for many years and made direct investigations in most of the states. "Either a person or a community must first want it and seek it before you can give it to them. Of course you can stimulate the want and the will to get it but you cannot do this—in fact, you may do the contrary—by forcing schools upon them or by showering them with money."

Maryland now provides special school aid for several of its "poor" counties. But this extra aid is not given until those counties do what they can for themselves. The state of Maine sets aside a special fund for equalizing educational opportunity. North Carolina is doing something of similar kind.

Those who advocate Federal aid claim that the end they have in view is the equalization of educational opportunity throughout the country.

Yet the Federal funds provided under their plan would be distributed substantially as funds are now distributed by those states which apply no equalizing plan to the process.

The $100,000,000 initial appropriation to the states would be divided in parts for different specific purposes; some for the eradication of illiteracy, some for "Americanization" of immigrants, some for the training of teachers, some for physical education, and some—one-half of all—for teachers' salaries and education in general.

In the end the states would share the total fund without regard to financial ability to provide themselves for their schools. New York State, for example, would receive nearly ten per cent of the entire fund; the aggregate of its allotments would be $9,021,282. Mississippi, with its greater need, would receive only $2,141,570. In the absence of Federal supervision, which the bill pretends to but does not disavow, the states would be free to distribute their allotments as they wish. Schools in rich cities might share them equally with poor rural communities.

Better Salaries Movement

ALTHOUGH one hundred million dollars is a large sum of money *it amounts to only about 7½ per cent of what is now being spent on the schools of the country* aside from the cost of carrying debts incurred on account of them.

> An educational expert connected with Harvard University figures it out that the Federal money which finally would reach the schools would amount to less than one dollar a child and less than forty dollars a teacher.

In return for this "help" the states would have to make positive engagements which amount to conceding to the Federal Government certain of their exclusive control of the schools. They would have to agree to maintain school terms of certain minimum length, to see that English is the basic language taught, to apply compulsory attendance laws; and also make annual reports to the Department of Education on how these funds, as well as equal sums put up by the states themselves, are expended.

In addition to the Department of Education there would be a National Council of Education made up of state school superintendents, twenty-five other educators and twenty-five miscellaneous persons appointed by the Secretary of Education. Thus the state's representatives in this council would comprise less than a majority; there would be plenty of room among the others for politicians, doctrinaires and exponents of cults.

This council very probably would soon become a propaganda organization for more Federal funds and more Federal authority over the schools.

Is this the best, or even a safe way, out of the nation's educational difficulties?

The bulk of the best educational opinion, such as that which comes from the universities and schools of education, is that it is not.

The prime supporter of the movement is the National Education Association, made up in most part of active teachers in the public schools. While it is the most representative of American educational organizations, only a comparatively small percentage of the teachers belong to it.

Many of them believe that Federal aid would bring them better pay, which in a majority of cases is highly deserved.

In fact, the present movement began as one for better salaries. It was started during the war by that branch of the teachers who affiliate with the American Federation of Labor.

The first demand by a political party for a Federal Department of Education was when the Socialists put in their platform in 1908.

"Let this bill pass," says Representative Finis J. Garrett, of Tennessee, "and in twenty years the style of your schoolhouses will be dictated from Washington."

With several states laying down laws as to what kind of "science" shall be taught in schools receiving state aid, one easily can imagine how far the Federal Government, remote from the people and controlled in large part by bureaucrats and cliques able to maintain perpetual lobbies in Washington, would go in the end if given pretext for exercising any control over the teaching of the more than 30,000,000 minds in the making that are and henceforth always will be in the country.

Where Civil Service Reform Was Conceived and Drafted

By HARRY PENCE

The Pendleton house, Cincinnati, in a room of which the original Civil Service Reform Bill was drafted.

THE oldest and once the most exclusive residential suburb of Cincinnati was Mount Auburn. It is now included in the city and its social vogue has long since departed. On the brow of this mount, overlooking the congested business and factory districts, with a view of the Kentucky hills in the distance, stands the substantial, square-built Pendleton home. The view is about all that remains of its former magnificence.

This stately old brick house was the home of George H. Pendleton, who was born in 1825 in Cincinnati to which city his father, Nathaniel Greene Pendleton, had removed from Georgia a few years previously after service in the War of 1812.

The grandfather, Nathaniel Pendleton, was a Virginian who served throughout the Revolutionary War on the staff of General Nathaniel Greene, in whose honor he named his son, and was suggested for a post in the Cabinet of President Washington. It is said that Alexander Hamilton objected to his appointment but the two subsequently became such friends that Pendleton was Hamilton's second in the fatal duel with Aaron Burr in 1804.

He was also a member of the convention that framed the Constitution of the United States.

Nathaniel Greene Pendleton, like his father, was a lawyer and in the year of his son's birth was elected to the Ohio state senate. He also served a term in the lower house of Congress. He was prominent in politics, an ardent Whig and it is related was delegated by the national chieftains of that party to be the companion and political guardian of William Henry Harrison during the campaign of 1840.

General Harrison, the hero of Tippecanoe, was nominated in December, 1839, nearly a year before the election. He lived at North Bend, Ohio, on the river fifteen miles below Cincinnati, and was known to be outspoken and given to voluminous letter-writing. For fear that he might compromise party hopes by some indiscreet utterances, "Nat" Pendleton was imposed upon him as a friendly censor.

After a classical education which embraced some years of foreign travel and a course at Heidelberg, Germany, George H. Pendleton also studied law and took to politics, but as a Democrat instead of a Whig.

His father had been thirty-two years of age when he entered the state senate; the son was twenty-nine. Each served only one term. Four years elapsed before the father was elected to Congress; the son was nominated before his term in the legislature expired.

George H. Pendleton remained in the House of Representatives for eight years, through the Civil War, and although he was fearless in opposing some of the extreme measures of the Lincoln Administration, he was never suspected of disloyalty.

He was prominently mentioned for the Democratic nomination for the Presidency in 1860 and was the nominee for the Vice-Presidency on the ticket with McClellan in 1864.

The reaction of the Civil War carried Pendleton into political eclipse from which he never entirely recovered, although his most distinguished service was rendered many years later. He was retired from Congress and in 1869 was defeated for governor of Ohio by Rutherford B. Hayes, afterward President of the United States.

When he was twenty-one years of age, George H. Pendleton married Alice, the daughter of Francis Scott Key, of Baltimore, author of "The Star Spangled Banner," and a niece of Roger B. Taney, Chief Justice of the United States Supreme Court.

For many years the Pendleton family lived in Mount Auburn in the big brick house at the east end of Liberty street. It was called Liberty street because it was the original north corporation line beyond which city ordinances were without effect, city officials without authority and city taxes a matter of no concern.

The Pendleton house, however, is on the south side of the street, occupying ground that was a part of the earliest incorporated village.

A half a mile or so northwestward, but a comparatively close neighbor in those early days, is the house which was the residence of Judge Alphonso Taft and the birthplace of William Howard Taft, former President of the United States and present Chief Justice of the United States Supreme Court. Other imposing residences dotted the hill, some of them more magnificent than the Pendleton home, but none of them favored with the same spacious outlook.

In 1879 George H. Pendleton was chosen United States Senator from Ohio, and although a member of the minority he took an active and influential part in national legislation. His chief success, one he had long hoped to achieve, was the final enactment of the Pendleton Civil Service Reform Act of 1883, by the provisions of which a merit system, based upon examinations, eliminated some of the grosser malpractices of the old spoils system.

It is said that Senator Pendleton worked out the details, made the earlier tentative draft and frequently discussed with friends and political associates the provisions of this law while living in this old house on the brow of Mount Auburn.

Forty years have passed and in that time there have been six changes in the national administration and six wholesale and general shake-ups in the civil service of the country, all more or less contrary to the spirit and many flagrantly contrary to the letter of the civil service law as it has subsequently been amended by Congress and modified by executive orders.

The Civil Service Reform Bill has not been an unqualified success, nor has it been a failure. Despite evasions by both parties it has been progressively, if not very appreciably, stiffened. Without it conditions would be much worse and the focalization of a healthy public interest upon the issue would result in greater betterments.

But for the labors of Senator George Hunt Pendleton, against obstacles which, till the very last of the long fight, seemed insurmountable, even such progress as has been made would have been impossible, for political observers are agreed that party rancor and party greed have increased with the decline of major differences between parties on issues of outstanding importance.

It is only natural that with the passing of differentiating characteristics or principles parties should concentrate the more keenly upon the struggle for place and preferment and that barriers to traffic in office should be resented by the "practical" stalwarts and wheel-horses of all parties.

When, however, the pendulum swings back—as eventually it must—the foundations laid will be found ready for a more formidable superstructure and belated honor be paid to the "father of civil service reform."

But this was not the only constructive work of Senator Pendleton. Always a student of government, he realized that although the framers of the Constitution, of whom his grandfather was one, had provided an elaborate system of checks and balances, designed principally against possible misuse of Federal power, they had not provided for a sufficient degree of co-operation between the executive departments and Congress.

In most parliamentary governments the executives of the government are also members of the legislative department or enjoy the privilege of appearing before the popular chamber of parliament to outline governmental policies and advocate or oppose legislation. In some countries only government initiated measures have, ordinarily, any chance of consideration and the ministry stands or falls upon their passage.

In this country there is a separation between the executive and legislative branches that has grown wider with the years. The President's messages, regular and special, are resented by the more partisan of the opposition if they can be construed as seeking to be coercive or threatening.

On the other hand, when Congress desires enlightenment on matters, full information about which is possessed by one of the departments, request or demand for the information is sometimes resented as imposing extra work on the department, as encroachment upon the prerogatives of the executive, as "matter which it would be contrary to public policy to make public" and sometimes friction and irritation is manifested on one side or both.

Then, when grievances accumulate to a certain, or rather an uncertain, point, one house or the other orders an investigation based on the presumption, implied or expressed, that there is something wrong.

The investigated resent the proceedings and usually seek to obstruct them. The investigators often attach exaggerated significance to comparatively unimportant revelations and discovery of the real truth is practically impossible when political partisanship animates either or both sides.

For the purposes of enlightened legislation Congress needs just such information as many of the departments and bureaus of departments have or can procure. A willing co-operation between them would result in much positive good and the elimination of much positive evil.

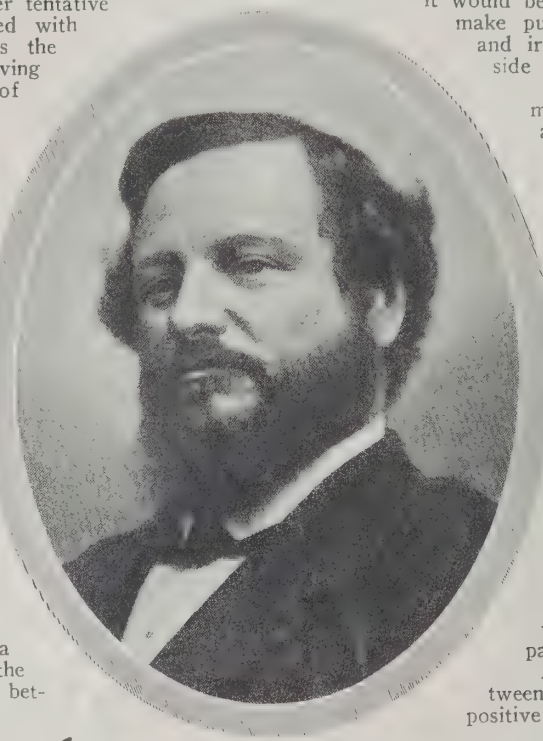
Just such co-operation George H. Pendleton sought to bring about when he was a Senator, as he had also endeavored to do when a member of the House fifteen years before. He introduced and made earnest arguments for a bill to provide for the regular and frequent appearance before both houses of the heads of the executive departments to give information and answer questions.

This bill was favorably reported in both houses, favorably discussed by the statesmen of the day, aroused little, if any, opposition and was simply not acted upon.

Its advocates maintained that under such a system gross departmental or bureaucratic abuses could not long continue and eventually justify more formidable investigations with sinister and revolting revelations. Disputed matters would be brought to issue quickly and settled. There would be fewer secret deals and less zeal for special favors.

Since Senator Pendleton's time others have tried to bring about the same or similar results. Some have even urged that Cabinet members be accorded seats and

(Concluded on page 14)



Geo. H. Pendleton

Where the Civil Service Reform Bill was formulated. This is a view from the house in which George H. Pendleton lived when he was formulating the Civil Service Reform Bill. From this point may be seen Eden Park, the Art Museum, Art Academy, Mount Adams, Passionist Fathers' Monastery, Rockwood Pottery, a section of the business district of Cincinnati, with a glimpse of the Kentucky hills in the distance.

British Communists Disappointed in MacDonald

Refusal of Loan to Soviet Russia Evokes Scorn and Fury:

Socialist Friends of Premier Apply Acid Test to Reds

By THOMAS C. TAYLOR

"The Accusation"

"You (the Communists) have had in your hands for seven years, in name of the 'proletariat,' a great country, self-sustaining in its resources, a great people utterly sick of bloodshed and on that account susceptible to the operations of any system which promised hope and peace, and the wealth of a great Empire. *What have you made of it all?* What have you done for the proletariat?

"Under the old regime, there were hundreds of thousands of peasant landholders in Russia. You took over the land. How many of the peasants now *own* land on which they expend their toil?

"Your records show that in the year 1922-1923 *you exported 8,000,000 bushels of grain.* How many millions of your starving proletariat *died for lack of grain that year?* Is it not the case, also, that in that year America by direct succor rescued from death nearly 11,000,000 of your people? And when these things were happening, were you not spending largely of the remaining resources of your land to carry your propaganda into foreign countries?

"Why have you failed to present to the world the greatest and most forceful argument in favor of Communism by showing the world the successful application of it in your own country? Many statements but no information come out of Russia. *Why have you killed freedom of thought?* Why do you find it necessary practically to intern and muzzle all foreign correspondents of independent mold?

"Your record shows *propaganda first* and your *proletariat last.* Has your work lowered or raised the life of your proletariat? Have you succeeded in your industrial theories, have you built or developed any means of transport or set up any facilities for the betterment of the condition of your people, out of the immense resources which were at your disposal when you took over, or out of the huge resources contained in Russia?

"Thus far you have proved only that you can seize and squander, that you can throttle liberty of thought and spirit. You allowed your land to lie in ruin and your people to die for lack of organization, but your propaganda organization remained always at full strength. Your *people* or your *propaganda*—which gave you the greater concern?

"In view of your record, why do you call yourselves Communists and expect the sympathy and help of a Socialist party?"

WHEN the Labor government of Great Britain, in its urgent search for means of reviving trade and relieving unemployment there, accorded recognition to the Russian Socialist Federal Soviet Republic, occasion was taken in THE DEARBORN INDEPENDENT to emphasize the points that such recognition, extravagantly welcomed as it was in Russia, implied no more than a willingness on the part of Britain's Laborists to talk matters over with Russia's rulers, and that not one of the questions outstanding between the respective nations was settled thereby.

It was suggested, also, that the Communists would be gravely disappointed with Ramsay MacDonald, the Socialist they had lauded in the days of his theoretic expansiveness and dialectic freedom, when they came to deal with him as Premier of Great Britain and custodian of the fortunes of the Labor party in that country.

Events have amply confirmed that view. A delegation of Soviet representatives has come out of the East in this Seventh Year of Utopia—Russia has had seven years of Communism now—and has encountered not MacDonald the Socialist but MacDonald the Premier, fashioned of the granite of the North. The clash has been interesting and instructive; not least to the delegation.

The indignation of the delegates, when they realized the position, was communicated in volume to Soviet headquarters, and appears to have raised quite a storm of wrath for Soviet Russia expected that recognition by a Laborist administration in Britain meant much more than a courteous welcome and the presentation of a troublesome list of outstanding questions While the delegation made it crudely clear, before they had been in Britain very long, that their hands were outstretched for money rather than in brotherhood, the suave greeting and the official handclasp have avowedly hurt them, as the flat refusal of a British loan has disappointed and enraged them.

A War of Interests

AS SOME indication of the fury and scorn which that refusal evoked in Russia, Britain has noted with interest, evidently, the publication by a Soviet paper of a cartoon in which appear three top-hatted roisterers arm-in-arm, the names under the respective figures being "The King of England," "MacDonald," "Jesus Christ."

Important points of the matters brought under discussion between the delegation and the British representatives have been made available, these affecting all the countries interested in the varied investments, amounting to more than 2,000,000,000 gold rubles, "expropriated" under Soviet rule. The British appear to have been seeking for some sign of willingness if not readiness on the part of the controllers of Russia to admit claims for the past and offer guaranties for the future. Such results as their search has yielded, it would seem have not been hailed with any enthusiasm by responsible British Laborists, who would not have been slow in sympathetic recognition of any change of the Soviet heart in that connection.

There was exceptionally plain speaking on the vital question of propaganda, the British regarding this phase of what they declare to be Soviet activity as ranking first in their relations with Russia. We are told that there was a formidable array of evidence against the rulers of Soviet Russia of persistent and relentless and costly efforts, continuing at the time of the delegation's visit, to force the Communist idea upon lands impinging upon Russian territory—a territory which touches more lands and more stages of social development than any other upon the earth. It is stated that the delegation was not slow to recognize the utter futility of denial in face of *the frank statement by Premier MacDonald that, in view of his personal knowledge of those activities—knowledge acquired, it may be accepted, in the days of his lesser responsibility, when the Soviet loved him—it was not only impossible to deny those activities but idle to expect him, of all people, to accept misleading "differentiations" between the Soviet government and the Third Internationale.* Guaranties were demanded that there be an immediate end of Soviet war in territories outside Russia upon existing systems of which the Soviet remains the declared enemy. Futile as they were, the denials are said to have been maintained even in the face of evidence revealing what the British believe to be Soviet propaganda directed against themselves in China, Afghanistan, India and South Africa and even extending to little Liberia.

MacDonald's Flat Refusal

THE most illuminating phase of the discussions emerged in the Soviet request for a loan. The reply was direct and unequivocal: a flat refusal. The request was persisted in. The delegation then learned that Britain blamed the Soviet, by confiscation and "expropriation"—if there be any difference—for destroying, as something inimical to their Communist ideal, an intricate and most valuable piece of international machinery, when they wiped out foreign investments in Russia; and in the British view had been convicted of using the parts of the smashed structure in lavish and costly efforts to wipe out all similar machinery in other countries. Had they changed their view sufficiently to safeguard now anything they might obtain from the system they hated? Had they anything to offer in the way of regrets and replacement in the matter of the structure destroyed? There was no satisfactory answer.

Premier MacDonald's friends are eloquent as to what they declare followed the failure of the delegation's fishing for a loan. The Scottish leader of the Labor party has sound defenses against such attacks as are stated to have been launched against him by the Soviet representatives in their disappointment. If Russia's delegates did not at once seek to undermine the Premier's position in his own "house," did not try to coerce him into acquiescence by attempts to influence members of his administration, did not seek the help of every Laborist of any note whom they regarded as extremist with a view to forcing the hand of the British Premier or "breaking" him, then their visit and their actions have indeed been fruitful of wrong impressions, and they have many misunderstandings to clear up with Mr. MacDonald's friends.

Their efforts in that connection evoked not only British Laborist wrath and condemnation of their "unscrupulous insolence," but also much satirical reference to the concurrent efforts of the great Soviet propaganda organization. "They have tried it all on us. Once again another gold field has been promptly discovered in Russia; once again dark hints of oil negotiations with foreign powers were in currency; once again they let loose rumors of war in Bessarabia. We have had it all before. The baits are stale. The rumors pass. If the Soviet desires to come out of its own accord as declaring that nothing shall stand in the way of its ends, *we* think they can neither break MacDonald nor carry on their propaganda under his nose and in the midst of his own party."

Russia's Valuable Resources

IT IS a natural development that a small but resentful group of Ramsay MacDonald's Socialist friends should seize upon the seven-year record of events in the world's center of applied "Communism," and, believing their leader to have been the object of an attack by the Soviet representatives, test the Communists by things done and left undone. The British Labor Party has had quite a lot of Soviet abuse, of late, and if some of the Britishers are inclined to hit back, they could hardly have adopted a more arresting method than by *testing Russia's Communists by the standards of Communism, as has been done.*

(See questions and accusations elsewhere on this page.)

British Labor's view apparently is that if the world is to be brought round to Communism, it will be by conversion wrought by the successful example of Communism in operation, and to that there is appended the opinion of some of Britain's Socialist party, that if Russia's wreckers and new rulers were ever real Communists they have certainly made an inglorious mess of a glorious opportunity. On both sides, instruction proceeds apace. If the quarrel develops, one may imagine a British Socialist expedition exploring Russia for evidences of official Communism.

An interested observer in touch with the delegation holds out greatest hopes of the Black Sea provinces of Russia, and records notable German success in getting at suitably situated natural resources of Soviet territory. The view is stated that in the southern provinces referred to, where experience of dealings with foreign peoples was so long and so widely established, and where the resources of Russia are so valuable and diverse, there would be immediate and very rapid trade development but for one fact—the people are afraid, not of the foreigner, but of a reaction from Moscow which would again deluge the land in blood, and which would have for its victims those who might respond best and most successfully to the influence of outside commercial relationships.

Meantime it is evident that the sheer force of facts is steadily shaping the future of a land destined to develop into one of the world's greatest markets, and one of the most important of those facts has just been made clear to the Soviet government by its experiences at the hands of Britain's Labor government.

Stirling Storied Castle at Gateway of Highlands

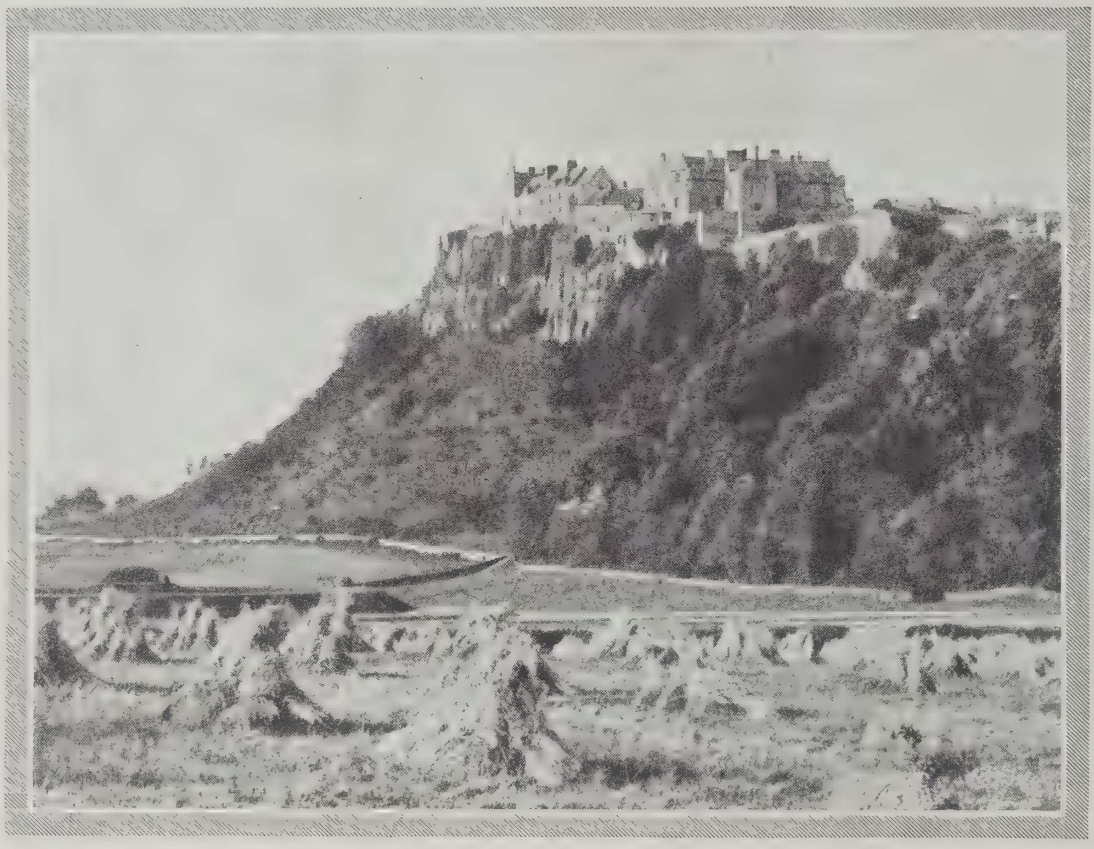
Grim Fortress Around Which Much Stirring History Is Written

By PAUL TYNER

This grim fortress surmounts a rocky height and commands enchanting prospects of Scotland's most picturesque scenery on all sides. Its history, filled with human thrills on every page, runs back a thousand years. Tardy recognition awarded in England to William Wallace, the national hero of Scotia, awakens vivid memories of his might and daring and as a valiant fighter for freedom. There is world-wide significance in Bannockburn to lovers of liberty, and the splendid struggle of Robert the Bruce with Edward the First of England through a whole generation of warfare.

SELDOM has the world witnessed a more dramatic reconciliation of history than that of the recent commemoration of Sir William Wallace, at Westminster Hall in London, where, six hundred years ago, he was condemned to death—a martyr to the cause of Scotland's freedom and independence. For parallels we have to go back to the erection of a statue of the Maid of Orleans on the very spot where she was burned nearly half a millennium earlier, and to the dedication in Rome of a statue of Giordano Bruno in the very square where he was doomed to the flames as a heretic.

Wallace's life and death is a story of long ago; but this late commemoration of his renown revives heroic memories, in its long-delayed English recognition of the grandest figure in the history of the sister Kingdom. On the floor where Wallace stood undaunted before the ancient judgment seat of the Kings of England, in the presence of judges who had been appointed not to try but to condemn him, a skilfully wrought and embellished brass tablet is now set to record his greatness.



Stirling Castle—West front viewed from the river. Comparison with the sheaves of oats in the foreground gives an idea of the height of the fortress.

King Edward I had spared no effort to capture Wallace, and the large rewards paid to his betrayers and captors are still a matter of official record. While he was being carried to London, special arrangements were made to rush his mock trial, and it appears that preparations for his execution were made simultaneously with those for his arraignment. He was crowned in mockery with a chaplet of laurel leaves. "It was unfair," said his judges, "that a man who had been outlawed should be permitted to defend himself!"

His plea that he had been born outside Edward's allegiance and had never entered it, was waived contemptuously aside. After being beheaded, portions of his mangled body were exposed to ignominy at various places—his head in London and the quarters in Newcastle, Berwick, Stirling and Perth. He was denied even a decent grave, the revenge of a ruthless monarch pursuing him even beyond death; but the whole soil of the nation he served and saved became his sepulcher and, at last, even the judgment of Edward has been reversed.

It seems strange that Wallace should have awaited English recognition of his true greatness so much longer than Joan of Arc or George Washington had to wait. Perhaps the explanation may be found in the sacrosanct character given to Edward by most English historians, and to the bias of blind worship of the canonized King in dealing with his Scottish enemy. The late Professor Goldwin Smith, in his "History of the United Kingdom," offered an estimate of Wallace which might have been that of a contemporary English chronicler. He speaks of Wallace as "an outcast from pity, a robber and a murderer; a man more cruel than the cruelty of Herod and more insane than the fury of Nero!"

But one great English historian, John Richard Green, although himself an admirer of Edward, has atoned for the words of his predecessors. "The instinct of the Scottish people," he wrote, "has guided them aright in choosing Wallace for the national hero. He was the first to assert freedom as a national birthright and, amidst the despair of nobles and priests, to call the people to arms."

Green was unquestionably right in calling Wallace the national hero of Scotland. He is its greatest and purest patriot. No nobler name can be associated with the historic hall in which he was doomed to death, the victim of a monarch whose military ambitions he had gallantly withstood. He represented the ideals which now have long united his own people and those who were then his people's enemies, in common service for mankind.

The indictment read on that fateful August 23, 1305, was indeed largely a *true* bill. When Edward I had conquered Scotland, Wallace had raised an army, had retaken Scottish castles and strongholds, had defeated an English force in the open field, had leagued with France and had ravaged the northern counties of England. On his ultimate defeat by Edward, commanding vastly superior forces, Wallace had refused the English king's terms of peace, continuing to uphold the banner of Scottish Independence. For these very things he is loved and honored by the people of Scotland. For these things, strangely enough, he was condemned six hundred years ago to die with the universal approval of a nation whose proud boast today is that it has done more than any other perhaps for that same cause of liberty.

In a large sense, Wallace made Bruce and Bannockburn possible. It was the spirit of Wallace that kindled the patriotism of Robert the Bruce into flaming action. His address to the troops on the eve of going into battle was an invocation of that spirit, and the Scots rose to the occasion and won the day by their splendid response to it.

As I walked across the Battlefield of Bannockburn today, I could not help feeling that this particular "decisive battle of history" has an importance for Americans, not less than for the Scots—an importance for lovers of liberty everywhere. It was no petty dynastic or territorial issue between neighboring kingdoms that was fought out under the shadow of Stirling Castle on that great day. In a sense, the whole future of the Anglo-Celtic peoples hung on the issue of the contest. It dramatized not merely a passing conflict between Saxon and Celt, but the universal human struggle which began with the dawn of history and has continued down to our own day with ever-increasing ardor, and which is likely to continue until liberty covers the earth as the waters cover the sea—a struggle for the freedom of the peoples against tyranny in any and every form.

Wallace, in truth, is own brother not only to the Bruce, of whom he was the immediate precursor in his own time and land, and who led his troops at Bannockburn, stirred and inspired by the magic of Wallace's name, but also to Cromwell, Hampden, Washington, Kosciusko, Garibaldi and Lincoln. Of Wallace it might be said that he embodied the spirit of freedom and of the irresistible power of right as against mere might.

I have seen many monuments in many lands, but no other impressed me so strongly as did that of Wallace when I first beheld it while motoring north from Glasgow to Aberdeen one brilliant day. Commandingly situated on a spur of the Gowan Hills, its towering height suggests something of the character of Wallace himself—a giant physically, mentally and morally. Rugged as his own Scottish hills, dauntlessly facing the day, this great granite tower fitly symbolizes the man.

From the northern road the Wallace Monument and Stirling Castle, crowning neighboring hills, mark the gateway to the Highlands. Stirling Castle, the frowning ramparts of which look down on the field of Bannockburn to the east and across to the Wallace Monument on the west, centers both historical and picturesque interest in an extraordinary way.

It is approached by an easy climb from the High Street of the ancient town of Stirling, along which I noted the contrast which the place presents between the old and the new. Side by side with motor busses, electric lights and modern public buildings, one finds structures that go back to the sixteenth century and even earlier periods. The farther one walks up this rocky slope toward the castle, the farther back one gets into the centuries. The church, even in its newer portions, is nearly 400 years old, while the western and older part has lasted half a thousand years.

The castle which crowns the rock is still older, in its history, at least. As to its actual fabric, although the original castle was a favorite royal residence from the time of King Alexander the First to the union of the crowns, it is by no means certain that any portion of Alexander's Castle now remains; for it has been more than once destroyed and rebuilt during the Wars of Independence. But there are walls still standing which go back to the time of Robert the High Steward of Scotland, grandson of the Bruce and crowned Robert II, the first of the "Stewart" line. The oldest parts of the building, within the outer walls, dates from the time of James II, who erected the Parliament House, while the palace was built in the reign of the third James and additions made to it by the fourth and fifth kings of the name, the palace having been finished in 1539.

At the head of the Castle Wynd a flight of steps leads up to the Castle Esplanade, a broad and nearly level terrace which affords ample space for a drill ground. At the most northern point, one comes upon a noble statue of King Robert the Bruce. The figure is about eleven feet in height and, standing on a pedestal still higher, represents the heroic Scot in the full armor of the period and in the act of sheathing his sword as he looks toward the field of his greatest victory.

The view from the Esplanade is one of the

Stirling Castle—Wing of the Parliament House. The Douglas Room where James V stabbed the Earl of Douglas is seen in the abutment on the right.

Stirling Town—Old Stirling Bridge, built on the scene of one of Wallace's great victories.

scenic glories of Scotland. The prospect, spreading away eastward and to the north, holds the many windings of the river as it twists its way through the lands of the Carse, forming those "Crooks of Forth," each of which, the old rhyme says, is "worth an earldom in the north." The eye is led past Alloa till it rests upon the broad waters of the Firth, and on a clear day catches a glimpse of Edinburgh.

The entire picture of water and woods and cultivated fields interspersed with towns and villages, mansion houses and farms, ruined abbeys and grim castles, is set between two ranges of hills. The range to the south of the river and the Firth of Forth looms shadowy against the horizon. But closer on the north are the beautiful Ochils, presenting their boldest rampart at the near western extremity in Dunmyat, but presenting a softer line all along their steep southern front. On the summit, inside this charming hill range, there is a perpetual play of light and shade as the winds drive the light clouds between it and the sun.

The outer gateway of the castle is guarded by a fosse about twenty feet deep and crossed by a drawbridge. Thence a passage through the archway gives admittance to the outer works of the castle. A second fosse and arched gateway once barred access to the inner works. This gateway is called "Queen Anne's Gateway," and shows her initials surmounted by a crown on the keystone of the arch. It is a reminder that a considerable addition to the outer defenses of the castle was made during the reign of Queen Anne. Walking along Queen Anne's Battery to its extremity, one gets a magnificent view to the southward. It is a view that has held travelers from far and near spellbound. At the right-hand side of the Gateway is the spur called the "French Battery," which was erected by the French engineers in the service of Mary of Lorraine during her regency. This battery commands the Gowan Hills and was effective in demolishing the fortifications erected there during the Rebellion of 1745.

Above—The Wallace Monument—One of the most imposing of the world's monuments. Erected to the popular hero of Scotland and champion of his country's freedom and independence, who has just been honored by a commemorative tablet in Westminster Hall, London, where six hundred years ago he was sentenced to be beheaded and quartered. Below—Stirling Town and Neighborhood—The Twin Churches in which several Scottish sovereigns are buried.

The palace must originally have been a building of great magnificence. It is one of the earliest examples of the Renaissance style in Scotland. In the center there is a small court called "The Lions' Den," a name which refers to the fact that lions and other wild animals were once kept here for the amusement of the sovereign. This "lions' den" is reached by a vaulted corridor which leads to the castle wall at a place called "The Ladies' Lookout," an old name carrying the mind back to the fair ladies of the Stewart courts who may have sunned themselves on this perch as they gazed over the far-stretching landscape.

The view from this point is indeed a superb one, embracing in its sweep the Gillies Hill and the Field of Bannockburn, with much else of historical and romantic interest.

Adjoining the palace is the Parliament Hall, a noble structure even at this day. Its interior is a spacious apartment 126 feet in length with a gallery all around it under a fine oaken ceiling. Many brilliant ceremonies were held here in the days of long ago, among them the Parliaments of 1545, 1571, 1578, 1645 and 1650. The best remembered of these assemblages is the Lennox Parliament of 1571, because it was illumined by a portentous remark of the "Infant Solomon," James VI.

The story goes that the boy king, then five years of age, was taken by his governor, the Earl of Mar, to the meeting and duly recited the speech which had been prepared for him. Then as he sat looking about him he espied a hole in the roof and inquired of his attendant what house they were in. On being told that it was the House of Parliament, he gravely said: "There's a hole in this Parliament!" And it was noted by those who had regard to the wisdom of babes that the deliberations of this Parliament came to naught, as the Regent Lennox was slain immediately thereafter.

The hall has long been occupied as a barracks. At the time of my visit it was garrisoned by the Princess Louise's regiment of the Argyll and Sutherland Highlanders.

Facing the Parliament House, the Chapel Royal, in which the infant Queen Mary was crowned and in which her son Prince James was baptized, is still standing; but its glory has departed, the chapel being now used as an arsenal, a refreshment room for visitors with souvenir counter, and a storeroom. The buildings on the left side of the square are now used as officers' quarters and military offices.

The center of interest in this block is the Douglas Closet, where King James II, in 1452, murdered the Earl of Douglas by stabbing him in the throat, because of his refusal to disband a conspiracy of nobles. In commemoration of her visit to the castle in 1842, Queen Victoria ordered a stained glass window with the Douglas arms and the motto, *"Look siccar"* in the very window of the King's closet out of which, tradition affirms, the body of the murdered earl was thrown, being buried where it fell. It will be recalled, by the by, that Queen Victoria's daughter, the Princess Louise, soon afterward married the Marquis of Lorne (the late Duke of Argyll), a lineal descendant of the victim of the royal murderer.

Descending a flight of stone steps and passing through the Douglas Garden, one reaches the surrounding rampart with a walk on the inner side. Here scenic interest combines with historical in rare degree. There are two special points of view from the rampart. The nearer is called "Queen Victoria's Lookout" and her name, with that of Albert, Prince Consort, and the date of her visit, are carved on the top of the wall. A little farther on we come to "Queen Mary's Lookout," the point whence the martyred Scots Queen looked out on the grandest prospect in her demesne and was thrilled by scenes that marked momentous happenings in her romantic life. In a walk around the rampart, one gets magnificent views to the eastward, where stretch the Carse of the Forth and the long Ochils melting into cloud-like forms in the distance. Nearer still stands the historic Old Bridge of Stirling.

All to the west lies the fair and fertile Vale of Monteith, the waters of Forth and Teith uniting nearby. Many stately and historic mansions—Blair Drummond, Cardross, Buchanan, Sauchie, to name a few—adorn this beautiful valley.

Definite history associated with Stirling begins with the reign of Alexander I, who occupied the Scottish throne from 1107 until 1124, and who frequently resided at the castle.

The strong position of Stirling Castle near the head of the country's most important estuary, guarding the fords of the River Forth and keeping watch over the passes leading to the Highlands, made this castle the focus of military operations. Seven times in a half century, the ancient stronghold changed hands.

It is a great story, beginning with Edward's becoming arbiter of the claims of various contestants for the Scottish throne and his simultaneous demand that all the competitors should bind themselves to acknowledge his claim to be Lord Paramount of Scotland. In accordance with this compact, a "Southron," Norman Darcy, was

(Concluded on page 14)

Stirling Storied Castle at Gateway of Highlands

Concluded from page 13

placed in command of Stirling Castle. Judgment was given in November, 1292, in favor of the feeble John Balliol, who was crowned at Scone, after swearing fealty to the English monarch. The oppressive restrictions of his overlord, however, proved too much even for the new king, and he soon renounced his allegiance and opened negotiations with France, thus forming a friendship that developed into a close alliance to last until the reign of Queen Mary, and which is evident to this day in a strong cordiality of feeling between the Scottish and the French, in contrast to the cooler emotions with which the English and French regard one another.

Edward invaded Scotland with a powerful army "to punish his perfidious vassal."

It was at this juncture that William Wallace, the fighter with the six-foot sword, came to the fore. His rise inspired the Scots with new courage. They required a man of might to lead them in the place of a "Toom Tabard," or "empty jacket," as they called their English-made King. The moment came on an autumn day when Wallace posted a fearless band of patriots on the Abbey-Craig ready to swoop down on the troops of Warren and Cressingham. The English commander made a mistake in attempting to cross the Forth by Stirling Bridge, thus playing into the hands of Wallace, whose spearmen rushed down the steep hillside and caught the foe in a trap. After this defeat, Sir Marmaduke de Tuenge endeavored to hold Stirling Castle, but receiving no succor from the south was obliged to retire, leaving it to Wallace and his Scots.

Falkirk, the following year, avenged the Battle of the Bridge and Edward recaptured the castle and regarrisoned it with English troops.

All the Scottish fortresses were now in Edward's hands. His arch enemy, Wallace, had been put to death in London. But Scotland, though crushed, was by no means conquered. Just at this crisis Robert the Bruce rose to kindle the dying spark of patriotism into an unquenchable flame. After winning back all the other Scottish strongholds, except Berwick and Bothwell, from Edward's grasp, Stirling came into the Bruce's hands with the victory of Bannockburn, on June 24, 1314. This great battle, which established the freedom of Scotland, was fought under the shadow of Stirling Rock.

In 1449, the year of King James the Second's marriage, William, Earl Douglas, brother of one of the Burgundian knights whose feats of arms brought honor to the chivalry of Scotland, was believed to have plotted against the throne in conjunction with Ross and "Tiger Earl" of Crawford. Hoping to persuade his powerful subject to break up this conspiracy, the king invited him to come under a letter of safe conduct to the castle for a conference. On the second day of the visit, while they were seated alone at a table in the King's closet, the King, angered by the Earl's refusal to abandon the "band," stabbed him in the throat, exclaiming: "Then I will break it. Take that, false Earl!" As already narrated, courtiers rushed into the room, finished the Douglas with their swords and cast his corpse out of the window.

This crime was the beginning of three years' civil war. Stirling's aid exhibited the letter of safe conduct in public by dragging it at a horse's tail, through the principal streets. Then they plundered and burnt the town.

It was at Stirling Castle that James III entertained his favorite musicians, astrologers, architects and poets. From the towers he studied the stars, anxious to know what the future had in store. In the Battle of Sauchieburn, near Bannockburn, fought on June 11, 1488, the royal forces were routed by the rebels and King James, during the flight, was overtaken and slain. He was succeeded by his son, the rebel Duke of Rothesay, who mounted the throne as King James IV.

The reign of James IV was probably the gayest period in Stirling Castle's history. The king's genial nature often broke through the gloom of remorse for his disloyalty to his father and gave mirth and joy to a brilliant court.

A few days before the death of James V, his daughter Mary was born on December 15, 1542, at Linlithgow, her mother being the French Princess, Mary of Guise. So she was born a queen.

Mary's son had been crowned James VI of Scotland in Stirling July 29, 1567, when only thirteen months old—and a few days after his mother, then a helpless captive, had been forced to sign a deed of abdication. In this ceremony, the baby was anointed king by the Protestant Bishop of Orkney, the Protestant Earl of Athol holding the crown over the infant's head, Morton Home taking the oath for the King that he would maintain the Protestant religion—and *John Knox preaching the sermon!*

Sir Walter Scott saw in this ancient Castle reminder of deeds of daring and self-sacrifice and of the joyous days of chivalry. The scene of the sixth canto of "The Lady of the Lake" is laid in Stirling Castle. Well he knew the history as well as the romance of this "Gray bulwark of the North."

New York City's Democratic Garden Party

Concluded from page 4

next thing he did was to resign from the law firm of which he was a member. The likelihood is that before the campaign is over, the charges of conservatism against Mr. Davis will be dropped.

Governor Bryan, of Nebraska, is a plain man, plainer than his distinguished brother, and not nearly so strong a personality. Yet he has executive ability and is a friend of the farmers. His nomination was meant to be a concession to the agrarian West. Probably no two more unlike men were ever on a Presidential ticket than Davis and Bryan. Yet it may turn out that the selection of a Bryan on the Democratic ticket this year is good politics. W. J. B. was against Davis because of his Wall Street associations. He will support the ticket and brother Charlie, and he is already on record to that effect.

In the past the Democrats have fought in National Convention assembled, and afterward enjoyed a peace and unity which was altogether surprising. Witness Baltimore in 1912, and the campaign that followed. The question now is, can they repeat the unity and victory of that campaign. It seems doubtful at this present moment. Champ Clark and his disappointed followers presented not so great a problem as some of the defeated and disappointed candidates who fought long and courageously in the Garden. Now the religious issue has been raised, and it will be slow to down. Not until early autumn will it be possible to forecast with any degree of accuracy the fortunes of the Democrats at the poles. Just now victory seems remote, but hope springs eternal in the politician's breast, and since the candidates have been named, many a faint heart has taken fresh courage.

The religious issue was here before the Democrats convened in Madison Square Garden, but what happened there has intensified the issue. The fathers of our country were well aware of the perils of religious tyranny. They tried to prevent that issue in the new republic. Thomas Jefferson drew up his famous bill for religious freedom in 1779, and it became the law of Virginia in 1786. That bill, which in essence is embodied in the first Amendment to the Constitution of the United States, is a truly epochal document. It includes, among other affirmations, this eloquent clause—*"We, the General Assembly of Virginia, do enact that no man shall be compelled to frequent or support any religious worship, place, or ministry whatsoever, nor shall be enforced, restrained, molested, or burthened in his body or goods, or shall otherwise suffer on account of his religious opinions or belief; but that all men shall be free to profess and by argument to maintain their opinions in matters of religion, and that the same shall in no wise diminish, enlarge, or affect their civil capacities."*

These are eloquent words, words that deserve to be printed in capital letters, framed, and hung up in office, shop, store and schoolroom. These words deserve to be read and pondered by Jew and Gentile, Catholic and Protestant. The ideals of Washington, of Jefferson and of Lincoln are on trial. They are being tested anew; they are being tried as by fire. Nor is it quite true to say that only part of the people are on trial. Every last mother's son and daughter of us needs a new birth of freedom and a baptism in the spirit of our fathers.

It would be erroneous, however, to regard the Democratic Convention at New York as only bitter loss or barren gain. It was magnificently alive physically—and that is something. Watching the play of passion and partisan zeal; observing that human vortex of loyalty to the various leaders; speculating on the staying powers of the delegates and convention guests, and marveling the while, a certain epigram of Wendell Phillips flashed into my mind. Said the agitator, "If the Alps piled in cold and silence be the symbol of despotism, we take the ocean as the symbol of a republic, pure only because it is in ceaseless motion."

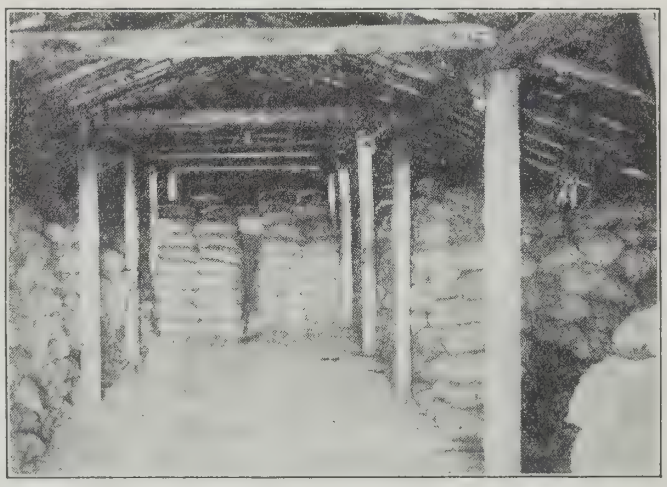
Potato Growers Beat Sapiro at His Own Game

Concluded from page 6

growers sent to Chamberlain was ignored for sixty days, when it was received at Denver. Thus matters rolled along until March 8, 1924, when suddenly there appeared a "statement" of account, not from Chamberlain or Sapiro, but from Sapiro, Hatfield, Levy & Hayes, the Sapiro firm which has its headquarters in San Francisco. This firm has been described previously in these columns. The potato growers had had no previous dealings with this company of lawyers, and supposed they had been negotiating at all times with Sapiro. They were informed, however, that they owed this money, some six thousand dollars, less whatever expense moneys had been paid, to Sapiro, Hatfield, Levy & Hayes—and to no one else.

Ten days later, on March 18, without further negotiation or correspondence, this firm filed suit in the California courts, seeking to take from the potato growers moneys which the potato growers had never agreed at any time to pay. The Sapiro firm immediately attached funds belonging to the potato growers, and supposed to be in the possession of Weyl & Zuckerman, in California. This attachment, however, brought out the fact that these moneys had been turned over to the potato growers. In some manner, the fine "co-operative" arrangement which exists between Aaron Sapiro and Weyl & Zuckerman, in the matter of taking money away from the farmer, failed to function this time, and the imposing legal firm of Sapiro, Hatfield, Levy & Hayes was for once left "holding the sack." Colorado potato growers say that Sapiro is afraid to bring the suit in the Colorado courts, for fear of the exposures which will follow, but eventually, since two states are involved, it probably will get into the Federal courts.

Meanwhile, the gentlemen who failed in their attempts to exploit the Colorado potato growers are working to regain what they have lost, but so long as Myer, Chenoweth, Moore and McKelvey are on the job, there is little hope for their success.



Eight thousand sacks of potatoes stored in one Colorado farmer's potato cellar. They were sold for $6,000, virtually all of which went to the farmer's bank account.

The Scene of Gray's Elegy

IT IS said that two things are threatening the church and churchyard of Stoke Poges, the scene which inspired what has been called "the finest poem in the English language," and which is the burial place of the poet himself. One of these is that the decay of generations, accentuated by the postponement of repairs, has caused the serious disintegration of the building, and the other is that the tentacles of Greater London are reaching out to grasp the historic structure.

It is recorded that when General Wolfe was moving up the St. Lawrence to capture Quebec he recited the lines of Gray's Elegy, and remarked that he would rather be the author of that poem than the capturer of the French stronghold. To him the line: "The path of glory leads but to the grave," proved indeed prophetic.

The quaint spire which surmounts the "ivy-mantled tower" has already been ordered removed, and the tower itself is considered so unsafe that measures have had to be taken to strengthen and protect it.

Stoke Poges, although it may soon be grasped in the greedy arms of London, is still a small country parish, and the immediate scene of Gray's immortal lines remains for the present a typical "country churchyard"; but the time seems not far off when all this will be changed.

Efforts have been made to preserve for all time the rural setting of the church, and an appeal has been made for assistance to carry out this project. "Much has been done," says the London *Times*, to secure for the church and churchyard in perpetuity a country framing. The chief danger-spot is the meadow of about thirteen acres outside the churchyard on the northeast, adorned with meadow elms of Thames Valley stature and dignity; and with the monument to Gray in the taste of his own century. A strip of three acres, including the monument, has been presented by two local residents and four acres beyond it have been bought, leaving about four acres more to be acquired.

It is also proposed to renew the fine old oak spire, and to repair the whole fabric of the church. The ashes of Gray rest with those of his mother in an oblong brick tomb of simple design—far removed from "the storied urn"—on the southeast side of the church. He often visited her at West End Farm, a mile away, which is now enlarged and modernized.

Stoke Poges is likewise connected with the family of William Penn. The founder of Pennsylvania died at Ruscombe, close to modern Twyford, and is buried at Gordans—neither of them far away—and the manor of Stoke was bought by his son, Thomas, in 1760.

Where Civil Service Reform Was Drafted

Concluded from page 10

right of debate in both houses, others have only desired willing, personal, direct and immediate information as requested. All have based their bills and resolutions upon those originally introduced by Senator Pendleton and when, in response to the realization of the need for this or similar means of bringing about the same result, some final legislation is enacted and put into effect, the benefits accruing from it will be due in a great measure to the almost forgotten Senator from Ohio.

Senator Pendleton's term ended in 1885 and that year President Cleveland appointed him minister to Germany. The Pendletons had been in Berlin but a short time when Mrs. Pendleton returned to visit their son in New York City. While driving in a park with the son's wife, the horses attached to their carriage became frightened and ran away. Both were thrown out and badly hurt, the elder Mrs. Pendleton dying almost immediately.

The bereavement was so great a shock to her husband that he fell ill, sought leave of absence from his post and, on November 24, 1889, died at Brussels, Belgium, on his way homeward.

Ty Cobb Has Highest Lifetime Batting Average

Has Overtaken Record After Record in the World of Baseball

By PAUL MACDONALD

TYRUS RAYMOND COBB is this year passing out of the major league picture. He is ending what the records will prove to have been the most useful career in the history of the game.

Cobb entered the major leagues in 1905 and since that time he has revolutionized the style of infield and outfield play, the style of batting and base-running. He has made of baseball a different game, and the changes that he compelled have made the sport more attractive for the spectator.

In baseball the outstanding records are held by Adrian C. Anson, Napoleon Lajoie, John P. Wagner and Tyrus Raymond Cobb. Of these the greatest is the record of Cobb.

This is the last year of regular play for him. He will get into the lineup occasionally in the next year or two and so it will still be several seasons before his record is complete.

There is nothing more for Cobb to conquer. When he completed the season of 1923 he had passed all existing records as far as lifetime averages are concerned and all that remains for him now is to better his own marks.

When Cobb's record is completed it will be found that he holds: The highest lifetime batting average of all time; largest number of hits; largest number of bases on hits; largest number of extra bases on hits; largest number of singles; largest number of three-baggers; largest number of runs; largest number of stolen bases.

Tris Speaker, manager of the Cleveland team, will hold the baseball record for two-baggers and George Herman Ruth will be the leader in home runs, but neither of these players will approach Cobb's lifetime record in total of hits, total of bases on hits, stolen bases, or his lifetime average.

Among Cobb's other accomplishments are: playing more games than any man the league has produced; leading the major leagues in batting for 12 seasons and leading the majors during nine consecutive seasons of these twelve; making the highest batting average recorded in a single season; batting above .300 for 18 consecutive seasons; holds at least three records jointly.

In three of his seasons he batted better than .400. Jesse Burkett did the same thing.

He batted above .400 in two consecutive seasons and Jesse Burkett did that.

He made 200 or more hits during eight different seasons. Willie Keeler did the same thing.

Cobb has overtaken record after record. Today he is supreme. And, on the baseball horizon, there appears no one who will probably challenge that record in the years to come. Anyway, it is certain not to be overhauled in the next fifteen years.

* * *

International polo has brought that game to the general attention of the public again this year. Few sports have as much money invested as polo and few sports are as little known to the average American as polo. And still it is one of the most picturesque, colorful and exciting games played in the United States.

Practice for the international matches were held at Aiken, South Carolina, this spring, and when this season was at its height there were stabled in the little town of Aiken, seated high in the pine-studded hills of South Carolina, more than one thousand polo ponies, representing a value of more than one million dollars.

Polo has spread rapidly and the game is now being played in every section of the country. It has recently been made a college sport and several of the leading colleges and universities in the East and on the West Coast are now represented by varsity polo fours.

Several of the polo clubs, particularly those in the Middle West, are trying to popularize the game. Some of the leading poloists believe that if the sport can be brought to the attention of the public it will soon secure a popular hold. That is possible, for the sport has the very qualities that the public demands in its sporting spectacles. The game will be watched by the general public but never played by the general public for, as we have suggested, it requires fortunes to play polo and more fortunes to keep up a polo establishment.

This year saw a strange shift in college rowing. Ed. Stephens, who coached the Portland, Oregon, Boat Club oarsmen, is coaching the Harvard crew, assisted by Sam Shaw who captained the Washington crew, 1923 winners of the Poughkeepsie regatta. And Ed. Leader, former coach of the Washington crew, coached Yale, with George Murphy, stroke of the 1922 Washington eight, as his assistant. The East was supposed to lead the country in rowing and now the East turns to the Pacific Coast to secure men to teach her oarsmen how to win.

It is an old theory in football that the captain of the team should play in the line and that a captain's leadership will be valuable only if he is one of the forward wall, for the line gives him the desired position from which to direct the attack and defense. But in recent years most of the captains have been members of the backfield, for the backfields produce the majority of stars and it is usually the star who is honored with the captaincy of his team.

This year will see a return to the line. Of 53 teams that picked captains for 1924 there were 14 that selected tackles, 7 that picked centers, 4 that elected guards and 8 that chose ends, while 6 named quarterbacks, and 14 decided on halfbacks or fullbacks, so the line wins, 33 to 20, in this list of schools which includes the most important football teams in the country.

The United States Lawn Tennis Association ruled last winter that amateur tennis players cannot write for the newspapers or magazines, nor can they write books.

This ruling was apparently a slap at William T. Tilden, the best player the game in America ever produced, and perhaps the best of all time in any country. Tilden and the governing body had an argument and it became broadly hinted that the association adopted the ruling to even matters to some extent with the player who had been syndicating tennis articles. Tilden replied that he was a newspaper writer before he gained a reputation as a tennis player and that he was a newspaperman first and a tennis player second. He was entitled to write.

We wonder what the United States Lawn Tennis Association would do about Bernard Darwin. He is one of the best golf writers today, an Englishman who discusses golf with a brilliant understanding of the game, an authority noted on both sides of the Atlantic. Darwin is also one of the best amateur golfers in England, and last winter he scored an impressive victory in the Oxford-Cambridge Golfing Society tournament, defeating the famous Cyril Tolley. No one on the other side has ever intimated that Darwin is not an amateur golfer. We wonder how the Lawn Tennis Association would interpret his case.

The rule should be applicable to certain cases but it is difficult to make a rule not applicable to all concerned. There are plenty of men in all sports, college football, professional baseball, boxing, amateur tennis, college basketball and track, whose names appear over articles not written by them. They simply sell the reputation they have established in the sport they follow. Some do write their own articles but they are desirable only for the name, not because of any cleverness in presenting their subject or any valuable information they can offer, for invariably the most efficient athletic performers are the dullest persons in the country when they set out to write down their knowledge, opinion or observations.

* * *

In recent years the cry has been raised that the trouble with modern pitching, or one of the troubles, is that the pitchers no longer can control the ball. There has been in the last few seasons an unusual amount of wild throwing by pitchers. Considering these facts, the record established by Grover Cleveland Alexander, the veteran pitching star of the Chicago Nationals, last year, is worthy of passing attention since it has been generally overlooked. Alexander, at this late stage of his career, issued but 30 passes in 305 innings or the equivalent of 34 games. He, therefore, averaged less than one pass a game.

The best record for control is held by Christopher Mathewson, probably the greatest pitcher that ever stepped on a mound. The peerless Matty in 1913 issued but 21 bases on balls in 306 innings, or an average of .061 per game. Mathewson made this record, the best ever established in baseball, late in his career.

Next to Mathewson comes "Babe" Adams of the Pittsburgh Nationals. He issued 18 bases on balls in 263 innings, or 29 full games. This gave him an average of .062 a game. There are a few marks pitchers can shoot at.

College letters came in for much discussion when Dr. John Wilce, director of athletics of Ohio State University, awarded the college letter to girl swimmers. This move of awarding the letter to girls brought serious objections, the contention being that it should go only to male athletes. The subject became one for general discussion in colleges and universities throughout the country.

The college letter is a comparatively recent institution. It had its start in the cap of the athlete's athletic uniform. Football captains used to exchange their caps after a game. Later on, the members of the varsity teams wore their caps on the campus as a mark of athletic achievement.

From cap to lettered sweater was a small step and speedily taken. Men that played in the big games of a varsity sport were allotted the lettered sweaters and they wore them proudly. Then colleges and universities adopted various minor sports and awarded letters nearly as large as those given to participants of major sports. This resulted in the first big row over letters, and the winners of letters in major sports refused longer to wear them because they had been cheapened by the award of letters in the minor sports. So the huge letter passed from view.

The result of the row was a rule, adopted by nearly all colleges and universities, forbidding the wearing of minor insignia. The law was enforced but they never restored the letter to its previous prominence.

Now that Ohio State University has awarded the letter to girl swimmers, the coed athletes in other institutions will undoubtedly be demanding similar recognition, which means that a new war in college athletics is dawning.

Ten Eyck, of Syracuse, is one of the country's leading rowing coaches. He knows a great deal about condition. He did much rowing himself and he knows what amount of strain the pulling of an oar puts upon the body and the nerves. In speaking of the four-mile intercollegiate race Ten Eyck said: "The four-mile race is not necessary but if a man can row one and one-half miles he can just as easily row four miles. If the man is in condition he will not notice the difference in distance."

There has been argument for years over the distance of this race. Many contended that it was at least one mile too long and that the effects of engaging in a rowing contest over that distance is damaging and lasting. Some years ago the distance was changed to three miles but it was returned to four.

Those who are beginners in any sport would do well to select some expert in the chosen field —one of the recognized leaders. Study this man carefully and note his style. Try to copy it. Get his form. Then you have a basis upon which you can build. After you have set this foundation you can develop your own characteristics of play. The thing is to get started correctly. A wrong beginning means that you have much to undo before you can become proficient. One of the leading racket coaches of the country once said: "It is far easier for a coach to take a person that has never tried to play than to take one that started wrong and has played a long time. The one without experience of any kind will become the much better player because the start will be correct. There will be no wrong training to undo."

* * *

Under the Olympic rules, Mrs. Molla Bjurstedt, born in Norway, cannot compete under American colors although she has lived in the United States for years. She must compete for her native land. This applies to several Finnish athletes who spent the last few years in the United States and who were to have competed under American colors at Paris.

If the Olympic committee rules were given strict interpretation and universally adopted then the national tennis championship of the United States would have been held for seven consecutive years by a Norwegian, and Jock Hutchinson's victory in the British open-golf tournament a few years back would be credited as a British instead of an American triumph. In fact, several championships claimed by the United States would be credited to foreign countries, for these titles were held by adopted performers and not home-breds.

* * *

Georges Carpentier, criticizing boxers and boxing, says there is too much tendency on the part of a large number of boxers to overwork. They believe the more work they do the better they will be in the ring. The same fault can also be charged against many tennis players, golfers and track athletes. In fact, men that believe the more work they do the more proficient they will become are numerous in every sport. To those we recommend the observations of Beals C. Wright, one of the most successful of tennis players. He said:

"The player should get a sufficient amount of competition, carefully mixed with relaxation. Relaxation is particularly important, for without much rest the player will find himself with nerves on edge and his condition stale when the test arrives."

A friend who had not seen Ty Cobb for six years met him at a ball game one day last season. "You have not changed a bit in six years," he commented. "How do you manage to keep up that terrible pace without growing a day older?"

And Cobb replied:

"I manage to get twelve hours rest every day. That is sufficient relaxation. I see that I build up all the tissues I tear down and get the nervous system back to normal."

No less than 4,000 varieties of rice are produced in Japan.

A Boston woman with a broad social experience for some years has been inducing girls in a finishing school to observe these five rules in judging a man: See him in work—notice his attitude toward his associates. See him when things go wrong. See how he acts in a trying situation. Determine his attitude toward his mother. And remember—society manners are merely superficial.

Police headquarters in New York is cramped for suitable wall space to place the bronze tablets on which are engraved the names of policemen killed in performance of duty. A single panel served to record all such deaths in the history of the city up to 1912. Since then an additional panel has been filled and another one begun.

Uruguay can now successfully grow all vegetables and fruits of Europe.

Once annually a committee of Treasury officials solemnly carry bundles of bogus bills to the great macerators and incinerators of the Treasury. This is all counterfeit money. On this day all counterfeit moneys, plates, dies, paraphernalia and materials, seized in the last twelve months by the United States Secret Service and not retained for evidence in court cases, are destroyed.

In Northern Idaho and Montana the Forest Service has established a special forecast of lightning storms for the benefit of the fire fighters. These forecasts are proving eighty-five per cent accurate.

Greenland is the second largest island in the world, Australia being the largest. Greenland is nearly seven times larger than the British Isles.

Ninety-six out of every thousand babies born in the United States die during their first year, according to an authority. He states that by attainable methods this could be cut down to thirty-eight a thousand, a total annual saving of more than ninety-nine thousand American-born babies.

A magnificent gold buckle, about three inches in diameter, was turned up in the soil on the Nedrobo farm, on East Bukn Island near Stavanger, Norway. The buckle is in three sections; the upper surface is of gold, richly ornamented with a design in filigree of Norwegian workmanship; the example of goldsmith work of the Viking age which Norway possesses.

The average annual damage to livestock and game is estimated to be $50 for each coyote and bobcat and $1,000 for each wolf and mountain lion.

There is readily available some five million horse power of water power in Spain. One project proposes to harness immediately some 300,000 horse power by exploiting the sources of the Segura and Jucar rivers by means of dams and tanks.

Vaults, supposed to be of Egyptian origin, have been found near the site of Fez in Morocco, and are supposed to be vestiges of a town destroyed about the year 1000 B.C.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

There are 2,700,000 employes on the pay rolls of the Federal and local governments in the United States, and 700,000 former employes drawing pensions. Every group of twelve citizens having jobs is supporting one citizen in government capacity.

Australia is constructing irrigation works in the Murray River Valley that is expected to render two million acres available for irrigation and close settlement. Dried and canned fruits, oranges, long-staple cotton, and wine are at present the principal products.

Drs. Eddy, Kerr and Williams, of Columbia University, have succeeded in isolating a sufficient quantity of one of the vitamines, known as "Bios," or Vitamine D, to ascertain its chemical analysis, crystalline structure, and general physical properties.

The Department of Agriculture of Yenching University, China, has been making steady progress since its organization in 1921. Arrangements have been made for procuring livestock from some of America's finest breeding establishments, as well as farm machinery of the latest type.

A torpedo-shaped piece of cast steel, weighing 150 pounds, with two handles welded to its sides, is used by the Los Angeles police department to break into lottery dens and gambling clubs.

Since the war Germany has become a large exporter of felt hats instead of an importer.

A clause in the will of Alderman Abraham Davis, of West Hampstead, London, who left a gross estate of $259,720, says: "Should any of my children marry any person who is not born of parents of the Jewish faith then he or she is to forfeit any share in the will."

A peculiar fish has been caught off the coast of Iceland. It is three feet long, jet black, and has a peculiar rod-like process protruding from the center of the back. The skin is covered with very sharp conical spines.

The postal authorities at Moscow announce that the official name of what was formerly called Russia is now "Union of Socialistic Soviet Republics," which is abbreviated "Ussr." They also say that they will not deliver any letters addressed to "Petrograd" as the new name of the former capital is now "Leningrad."

Although the Filipino builder of today usually erects his house firmly on the ground, many of the natives still persist in making their homes high in trees.

The popping of a grain of popcorn is an explosion due to the expansion under pressure of moisture contained in the starch grains. The explosion ruptures the outer coat, turns the grain inside out and exposes the white part of the grain.

Siberian natives, thinking to cheat the purchasing agent of an ivory importing company, substituted the tusks of a prehistoric mastodon for the walrus ivory. However, the mastodon ivory was well preserved and was of more value than that of the walrus.

An inscription on a monument in Alabama reads, "In profound appreciation of the boll weevil and what it has done as the herald of prosperity this monument is erected by the citizens of Enterprise, Coffee County, Alabama." The weevil proved a blessing in that it taught the farmers the prosperity that follows crop rotation.

A community organization of Davella, Martin County, Kentucky, has raised $27.50 of a necessary sum of $250 for the purchase of a radio receiving set, that the three hundred people living within a radius of three miles of Davella, which is without church services, may hear sermons delivered by ministers in other parts of the country.

Experiments carried on with artificial and colored lights have completely confirmed the theory that the seasonal blossoming and fruiting of plants is not due to temperature but to the length of day.

The production of gold in the Transvaal in May was the largest in any month in twelve years. Its value was about $16,713,000.

Sir Arthur Keith, the eminent anthropologist, after studying human skulls of the pre-Roman and other periods, declares that the British face is getting decidedly longer.

Blackfoot Indians in Canada are to have the first Bible written in their language.

Former Mayor William Hale Thompson, of Chicago, is on his way to the South Seas with the object of taking photographs of tree-climbing fish.

The crown jewels and precious objects in the old Seraglio Palace, Constantinople, are to come under the auctioneer's hammer instead of being preserved in a museum.

Hens need more fresh air in proportion to their weight than any other animal.

Brick-making, the most ancient of all the industries, is today one of the basic industries of the nation, and bricks are composed of exactly the same material and manufactured according to the same principles as the ancient product.

Shih Hwang-ti, Chinese "First Heavenly Emperor," was a modernist in his day, 259-210 B.C. In repudiation of antiquity, he ordered the classics to be burned. The scholars who rebelled, he put to death or condemned to labor on the fifteen-hundred-mile Great Wall.

CHRONICLER OF THE NEGLECTED TRUTH

Welding Together of the World's Peoples

America's Character-Forming Influence Is an Important Factor

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.

Copyright, 1924

THERE are tendencies today which point to a grave danger that the wave of the brotherhood-of-man ideal may sweep even thinking people into the ranks of unthinking sentimentalists. Probably most educated persons will agree that genuine, enduring brotherhood is the world goal; that in things of the spirit peoples must inevitably become more and more similar. The fruits of the spirit among men during all historic ages are the same, and between the great souls of the past and those of today brotherhood exists as a natural phenomenon. I believe that the trend of cosmic evolution will continue, and that the day of International Brotherhood will ultimately succeed. But cosmic evolution is orderly. We shall not jump from the child to the full-grown man.

Nationalism is a natural stage in the inevitable group struggle for existence, if the group persists under conditions favorable. Normal adult individuals in any group of people who have long interbred, long lived in the same environment and speak the same language, are in the grip of like memories, common daily experiences, and similar hopes. Such a people in time becomes the product of its hereditary, environmental, historical, and idealistic factors. During the early life of the group, certain reactions tend to become customary conduct. This conduct may be called the habitual or instinctive "trend" of the members of the group. If this conduct results in the decided well-being of the group, other of its primitive instinctive reactions will increasingly tend to be suppressed or directed toward the more beneficial conduct. This strengthens further the characteristic "trend" or "bent," until very definite customary reactions characterize the individuals of the group. Thus, in the long run, each distinctive group of people develops certain definite characteristics or a distinctive character.

In the development of mankind the more advanced groups of peoples become increasingly self-conscious of their own distinguishing emotions, thoughts, actions, and aspirations. As Fouilee, the Frenchman, says: "In the discussions of the race problem there is one factor of supreme importance which has been so far disregarded, to wit, the opinion or idea which a race has of itself and the influence excited by this idea. . . . Hence we have a certain self-consciousness in a race, imparting to each of its members a kind of racial personality; a tendency to affirm this personality more and more strongly."

This character of a people with the developing self-consciousness of their character constitutes the nationalisms of a people. Nationalisms are at base psychic. They are deep-rooted in the emotions of peoples. Those emotions which are crystallized out of the group experiences of the past are the most enduring among the less advanced peoples. Among each developing people there arise in time clearer and clearer hopes and aspirations which have the lure of great desires or the driving force of prophecies. These also become a part of the real character of each people.

At last, nationalisms are seen to constitute distinctive psychic group personalities expressing themselves first as emotions founded on memories of past experiences; then, developing very slowly, expressing themselves increasingly as intellectual hopes. Among the most enlightened peoples this community of hopes seems destined to become more dominant than their earlier community of memories.

Here is the hope of the future—not that we shall do away with the national spirit, but that nationalistic groups shall become increasingly intellectual, idealistic and directive of progress. The great hope of the future brotherhood of man will be possible of inception and survival only as the composing nationalistic groups are more and more intelligent, self-respecting, fair-minded and idealistic. The more developed along these lines each nation is as a unit, the greater will be the strength she can contribute toward hastening the arrival of the day of international federalism, and toward its success when once begun.

The Gospel of Service

THE doctrine of nationalism is thus advocated as a means, not as an end. The development of nationalisms as an end is the chief cause of the destructive imperialism of which history is so full. That end has shown the undesirable aspects of nationalism as "shadows fiercely underlined." But the doctrine of nationalism should mean the gospel ("good news," as the Greek uttered it) of service. If the doctrine of nationalism is founded solely on our rights, we are building for imperialism. If it is founded primarily on our duties, we are laying solid foundations for an international federalism of some future day—not for tomorrow, but for some farther, though certain, future.

We may say, then, that the function of the nationalistic group is to originate, develop, and perpetuate its unique personality and its nationalistic expressions as cultural contributions to the development of mankind. Mazzini said, "Every people has its special mission which will co-operate toward the fulfillment of the general mission of humanity. That mission constitutes its nationality."

The goal of universal likeness among peoples or nationalistic groups is a false goal. A people or a nationalistic group, in the same way as an individual, does best when most natural, when most itself.

Dr. Felix Adler, professor of Social Ethics, Columbia University, does not hesitate to say that varieties of types of civilization are not only desirable but that such is the "ethical aim toward which the efforts of the genuine lovers of progress should be bent." Again he says: "If humanity is ever to become a *corpus organicum spirituale*—and that is its aim—then a conception based on reciprocity of cultural influences, favorable to the greatest possible variety of types, and assuring to the different groups of mankind their integrity as distinct members, that they may make manifest the distinctive gifts with which Nature has endowed them, seems unavoidable."

Even the general secretary of the Interparliamentary Union, in outlining "the international parliament of the future, which is no doubt coming," said: "I do not see any ideal in international uniformity. On the contrary, national and racial diversity is in my opinion a condition of progress and life."

It is scarcely wise for a leader today to think of his nation as "a pet of the gods," yet what can better assist a group toward "the thrilling summons" of accomplishment than the conscious knowledge that it has a mission because it has developed a worthy distinctive genius?

Nations, like men, become weaklings when all struggle for self-expression ceases. As the most valuable man in his community is the *strong* man, the man who "stands for something," whose very goings and comings may be predicted by his community; so the most valuable nation in the era of new internationalism will be the strong nation whose characteristics are known, and whose attitude toward clear-cut international questions may be safely predicted.

There is always danger of being misunderstood when a nation or an individual emphasizes nationalisms. A people's nationalisms should be so conceived of by oneself, and be so presented to other persons, that they could not reasonably lead to the primitive conception that known existing nationalistic differences mean the inferiority of one group to another. Neither should emphasis of nationalisms lead to hurtful or even sentimental prejudices by one group against another. Instead, the emphasis of nationalisms should be constructively beneficial.

One of the most valuable results ought to be that of developing and maintaining an intelligent and deep appreciation of the strengths and weaknesses of one's own group, and so thereby assist toward its improvement. Those nationalisms which are strengths, and which are worthy, should be retained; unworthy or weak ones should be discarded at whatever cost. Such a course ought naturally to tend to prevent nationalisms from becoming dogmas or fetishes.

Lack of Political Self-Control

THERE is another important thought which should be added here. The genius of all peoples does not appear to be political. Some have failed utterly even to acquire the technique of political self-control and self-government as developing peoples. Some apparently lack proper capacity. Some lack proper opportunity. Some lack proper location or other material conditions. To illustrate: Scores of distinctive groups of peoples survive today whose political control is still on the lowly plane of "savagery." Others have developed into that higher plane called "barbarism." Still others are on the higher plane of so-called "civilization" whose individual members are subjects of surviving hereditary power. While above them all is that elevated plane of political self-control called "enlightenment" where the government is solely in the hands of its individual citizens.

Without a temporary breakdown of the world's morale, the technique of political control will not revert suddenly from this present highest plane of the citizen to that of the subject; nor from that of the subject to that of the barbarian; nor from that of the barbarian to that of the savage. Instead, the onrushing stream of development in political control is a mighty complex of forces carrying the cultural peoples faster than ever toward freer and fairer self-government "of, by, and for" themselves.

In this connection it should be recalled also that the greatest contributions which have been made to world civilization by various nationalistic groups have seldom been political. The Chinese contributed a great code of morals; the Roman, law; the German, master music; the Scandinavian, coast-free oceanic navigation; the Russian, a realistic and compassionate interpretation of life; the English, constitutional government; the American, the ideal of the widest realization of democracy—beginning in the ideal of government and developing to include all aspects of individual interrelations. Political genius which develops states is not necessarily the highest type of nationalistic genius. It is unwise for a nationalistic group to lose its unique cultural soul trying against unconquerable odds to develop impossible political genius.

As we have seen, nationalism is an historical product of a complex of conditions. A well-defined or isolated geographic area, or nest, maintaining a long-lived group, consisting of a homogeneous people, speaking a common language and having a common religion, offers the historical conditions most favorable to fullest development and expression of the nationalisms of the past. Today there must be added the conception of a controlling consciousness as to aspirations for future development.

The Jewish nationality is the world's classic and only example of a strong nationalistic personality persisting long without a home-nest. Three chief factors have had to do with this survival of Jewish nationalisms in scattered geographic areas. One is the innate belief of the Jewish people that they are a very distinctive and selected group—"God's chosen people"—thus favoring Jewish segregation even in the midst of a populous area controlled by another nation. Another is persecution, which compelled isolation quite equal to that secured in a separate political and geographic state. Another is the tremendous virility of Jewish religious beliefs which are as much nationalistic as religious, and so foster Jewish nationalisms. A recent study, published October, 1923, goes far to convince that even the Jews are no exception to the rule that a well-defined geographic nest is necessary. Says Nahum Slousch, "From the basin of the Don to the basin of the Dniester—traversing the Dnieper and spreading south to the littoral of the Black Sea and west to the Carpathians and the Danube—extends a homogeneous Jewish mass, united by traditions, analogous customs, and a common vernacular. *This compact nationality,* for it *behaves like an authentic nation* and not at all like unrelated colonies or communities, numbers about ten million individuals."

American Nationalisms

CHINA is our best illustration of a long-lived nation. Dr. Reinsch has said of China that of all nations she is most capable of living without any government whatever because "the Chinese do not think very much of the formal act of the government. They know that nothing can be accomplished permanently unless the people are convinced of its justice." They rely upon the strong feeling of equity which dwells among them out of their long memories of the past.

As to a homogeneous people, probably Norwegians constitute as pure an ethnic group as any in Europe today. While their nationalisms are purely Teutonic, they will not be mistaken for those of other Teutons, such as the Germans or even the Swedes. The English offer a splendid illustration of the amalgamated group having developed a strong nationalistic personality. One thousand years ago the Englishman had not yet come into existence. He is the amalgamated product in England of the early prehistoric peoples, the Iberian or Mediterranean men, the Celtic or Alpine men, and the Teutonic men, with the last arrivals in the year 1066, the Norman-French. The Englishman is the result. He is not an Iberian, a Celt, a Teuton, or a Norman-Frenchman. He is spoken of as the "Anglo-Saxon"—more correctly, the term "Teutono-Celt" should be used; or, better still, because he is more than that and is already "made," he is and should be called simply an "Englishman." Probably no group of people today possesses stronger and more distinctive nationalistic characteristics than does this Englishman.

There is scarcely a single strong nationalistic group that does not possess a natural universal means of intercommunication. That most strenuous new aspirant for nationalistic entity, Turkey, is now casting out "all traces of alien speech largely [Arabic and Persian] and is replacing them with old Turkish words to such an extent that the inhabitants of Constantinople are frequently unable to read government notices," writes Marcosson.

The potency of a nationalistic religion to batter down even the older instincts and ties of so-called race is well seen in the nine nationalistic branches of the Greek Orthodox church, most of which are among the extensive Slavic people.

While on the subject of nationalistic religion we may note that of all emotions which have stirred a man to give up his life in a great cause, two, religious zeal and love of country, are the most powerful. Often the two have been inseparable. The martyrs who have died for religious faith are not more numerous than the zealous martyrs who have died for love of country; probably, also, neither are they fewer. Moreover, as religion has furnished the inspiration for the expression of art, so love of country has been the inspiration for literary expression.

Coming now to the last point, that today the most elevated developing nationalisms feed on future aspirations, America is the classic illustration of a land possessing distinctive nationalisms which are based extensively on her hopes for the future.

By way of summary, the Japanese nation is undoubtedly the best all-round example among modern peoples of a nationalistic group living under all of the favorable conditions mentioned. They developed in a very separate geographic nest; they have long life with a corroborated history of 1,500 years and a traditional history of 10,000 years; they are a well-amalgamated people, having great powers of cultural assimilation; they possess a common indigenous language; have a strong nationalistic religion; and they have an intelligent, progressive long look ahead.

A word may be added as to American nationalisms.

During the decades from Washington to Coolidge, our nation, largely in undisturbed geographic isolation, has experienced a unique character-making life. Never before has a people so quickly developed such an extensive area of contiguous lands; never elsewhere has a population so quickly reached a hundred million souls; never before has a nation become so rich; never before have the citizens of a land so quickly attained so high a level of general material and cultured elevation; and never elsewhere have the ideals and opportunities of a nation drawn such multitudes of men from all the diverse peoples of the earth.

Such unique conditions necessarily mean that there has developed, in Washington's words, "an American character." It expresses itself in distinctive characteristics, or in American nationalism. Today there are certain difficulties in the way of maturing these nationalisms.

Long life, which is so essential if nationalisms are to

(*Concluded on page 15*)

He Is an Expert in Volcanoes and Earthquakes

Remarkable Work of an American Scientist in Hawaii

By JOHN ANSON FORD

OUT in the mid-Pacific is a strangely interesting man who, with his devoted wife, has been living on the top of a live volcano for the past twelve years. Kilauea, on the Island of Hawaii, is the unique site for this man's home—the volcano which in recent weeks "staged" an eruption more violent and spectacular than any that has taken place since 1790, when history tells us a large part of the Hawaiian army, which happened to be passing that way, was killed by flowing lava and flying red-hot boulders.

This man is Professor T. A. Jaggar, and the fact that he lives in a place which would cause most mortals to shudder with terror finds explanation in his firm belief that if men of science will persistently and constantly study the earth and its changes, there will be revealed facts about volcanoes and earthquakes which will be of incalculable value to mankind. Just as recent years have seen meteorology developed to the point where weather forecasting is a fairly accurate science, so the day will come, in Professor Jaggar's opinion, when man will know how to predict volcanic eruptions and earthquakes.

The great spectacle which has just taken place in our island possessions in the mid-Pacific only serves to call attention more forcefully to the pioneer work of this man and its value to all mankind. Unfortunately Professor Jaggar was not present during the whole of the eruption of Kilauea, being on a visit to the mainland of the United States; but he hastened home by the fastest steamer and completed his return by flying from Honolulu to Kilauea by airplane, a trip that ordinarily takes eighteen hours.

As yet Professor Jaggar is not prepared to give out his final conclusions regarding the significance of this eruption—which surely would have driven him from his crater-side home for a few hours at least, had he been home—but it is worthy of note that this scientist has repeatedly placed himself on record in recent years as believing that another explosive period might be expected at Kilauea. Thus, the recent spectacle is striking proof of sound reasoning and deduction, based not on superficial observation (there has been no such terrible violence for 134 years) but upon painstakingly gathered scientific data.

Professor Jaggar does not attempt to say how soon the forecasting of earthquakes and volcanic eruptions will become an accurate science but he has very definitely pointed out the way that such advance can be made.

In numerous scientific papers he has earnestly advocated establishing thoroughly equipped observatories in all parts of the world to observe and measure the changes in the earth which take place from day to day, year by year, and decade by decade. If men of medical science will spend years striving to isolate a disease germ, is it not reasonable to spend time and effort in analyzing the habits of Mother Earth? Mountains are gradually rising and falling, our great rivers are steadily altering their courses, the bed of the ocean is forever being transformed by unseen forces —and yet mankind has no comprehensive, continuously operating system for measuring these changes. Likewise, the observatories on Kilauea where Professor Jaggar is stationed and Vesuvius, are studied year in and year out by scientists.

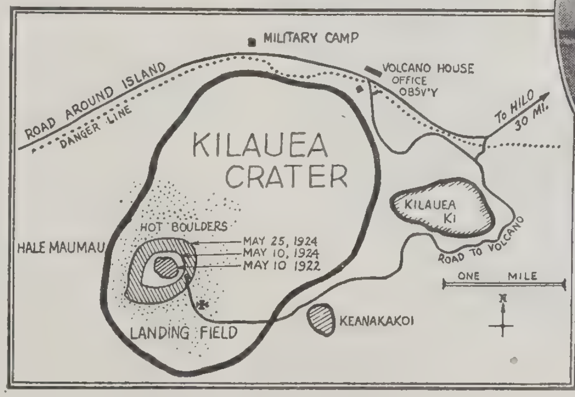
And yet what is taking place in and about the volcanoes of the earth, in the mountain ranges and on the ocean's bed, would be a very definite index, says Professor Jaggar, to future moods of nature. Things do not "just happen" in the realm of natural phenomena any more than in any other realm. Causes are constantly at work which eventually produce such catastrophies as that which has overtaken Japan. Man's problem, therefore, is to learn the changing aspects of Mother Earth so intimately that he will be able to predict, in some instances at least, the great upheavals which now prostrate cities and empires without warning.

I found this man who has made friends with volcanoes on the top of Kilauea, the ever-active crater which Hawaiians proudly claim is the world's most wonderful spectacle. His powerful frame was clad appropriately for the rough field work which occupies so much of his time. He wore puttees and a visored cap was pulled well down over his piercing eyes and iron-gray hair. His face was smooth shaven and tanned with much work in the out-of-doors.

At the moment he was supervising a drilling operation, which is a part of an investigation of temperatures in the top of Kilauea—a work which shows the practical side of the professor's mind. He believes that a way can be found to utilize the vast amount of heat which exists beneath the surface of this volcano. Once means have been found for generating steam with this heat, and harnessing it, enough electric power could be created to operate all of the machinery on the Island of Hawaii. This sort of thing is being done in certain parts of Italy, and while conditions are somewhat different in Hawaii, the professor believes that ways can be found to effect similar development. As a first step it is hoped to develop enough current to take care of a hotel not far away, as well as the Hawaii Volcano Observatory, of which Professor Jaggar is director, which is maintained by the United States Weather Bureau and a scientific association, jointly.

But this man's chief interest is in learning the moods and secrets of volcanoes and in studying earthquakes. At the earliest possible moment after the disaster in Japan Professor Jaggar hastened to that stricken land and made a most exhaustive study of conditions there. While the work of no observer or group of observers for a few weeks or months can be complete or conclusive, there is no question but that Dr. Jaggar compiled data concerning this upheaval which will prove invaluable to science.

This will give some idea of the volume of smoke that follows an explosion.



This map shows where rocks and ashes have been falling from the eruptions of Kilauea volcano. The danger line established by Boles is indicated by dots beginning just below the road around the island. Rings show the extensions of the firepit on May 10 and 25, and its comparative size since 1922. Cross marks spot where Truman Taylor of Pahala was killed by flying rocks.

The eight-ton boulder was thrown 3,000 feet from the bottom of the pit 1,200 feet, May 28, 1924. Kilauea Flying Field, Hawaii National Park.

It is particularly appropriate that at this time the world should learn something of the work and daily life of a man who is striving so earnestly to lay the foundations of a science which, if not new, is still possessed of a meager fund of knowledge. Geophysics is the best technical term to cover the broad field to which "the sage of Kilauea" is devoting himself but despite his fine technical training I suspect he would prefer to call it merely "the science of our changing earth." Since no man can become expert in so vast a realm of research, Professor Jaggar is specialized in volcanology, and he has very definite ideas about the methods that science should pursue in this and related fields.

He believes, for example, that occasional expeditions —such as he himself recently took to Japan—are far less satisfactory than constant year-round study. Before coming to Hawaii a dozen years ago he shared in many expeditions to volcanic regions but he declares frankly that in the time that he has been living on top of Kilauea he has gathered far more knowledge than was furnished him by all his earlier expeditions or by a vast amount of research in books.

All of which explains why he and Mrs. Jaggar are content to live in a most picturesque rustic abode on the very rim of Kilauea's outer crater. The latter is a great black scar-like depression in the earth's surface, some three miles in diameter and several hundred feet deep. The floor of the crater is covered with lava, the accumulation of countless eruptions, some of which Professor Jaggar has observed at close range. In the middle distance of the strange panorama that stretches before the Jaggar veranda is Halemaumau, or "House of Everlasting Fire." This is the inner crater, a thousand feet or more across and at all times containing boiling, seething lava. The level of its molten contents is constantly changing, sometimes being the same as the floor of the outer crater in the midst of which it is located, and sometimes falling six and seven hundred feet lower.

Adding an awe-inspiring grandeur to the scene are clouds of smoke, and sulphurous steam which issue from a hundred vents in the crater floor and from Halemaumau in such volume that at times that inner crater itself is wholly concealed from view. At night the spectacle becomes almost overwhelming in its terrifying grandeur. Like a great fever spot in the low hanging clouds is the reflection of the boiling lava in the inner crater. This glow becomes very intense at times, shedding a faint weird reflection on the surrounding landscape and turning into sharply cut silhouettes all objects which come between the spectator and the "House of Everlasting Fire."

It is amid such surroundings that Professor Jaggar has worked, ably assisted by his wife, who has shared in many of his adventures. They have done something which has seldom if ever been done before. They have undertaken to establish a minute-to-minute, decade-to-decade observation of two volcanoes (Kilauea and its giant neighbor, Mauna Loa) with the aid of an adequately equipped observatory. The results have more than justified the scientist's hopes, for always the investigators are coming on new and unexpected conditions, whether they are surveying glowing lava pools and blowing cones or measuring the width and depth of lava flows and their hardening margins. At times they have seen nature move, as it were, by leaps and bounds. On more than one occasion they have seen the column of lava in the inner crater sink several hundred feet in a few hours, a change that was accompanied by a crashing of walls, over-toppling of crags, and a roar of escaping gases such as only Milton or Dante could adequately describe.

At another time, while surveying the tidal motion of certain lava lakes and making observations with a transit *every twenty minutes for a month* there suddenly burst up through the cracks, one night, a wonderful geyser of liquid lava, a few feet from where the party was located. It welled up like an artesian well or an oil gusher, bright orange and dome-shaped, burning hydrogen and carbon gas and sulphur and standing 20 feet high.

In March, 1921, when the inner crater was all but lifeless and covered with a dull crust 50 feet below the surrounding level, the whole mass began to lift suddenly during the night and by six o'clock the next morning was flooding the surrounding region, sending out lava rivers a mile in length. Then as the hours passed these scientists saw this overflow form into huge caldrons containing fiery fountains by the hundreds, jets of brownish fumes, numerous small tornadoes, and boiling pots that threw masses of hot lava hundreds of feet.

Mauna Loa is the snow-capped peak which travelers approaching the island in clear weather can see from long distances out at sea. It is the big sister of Kilauea, volcanically speaking, twenty miles away as the crow flies, and is in eruption at intervals of a few years. Recent observation seems to indicate that it "operates" on a nine-year cycle. This volcano rises to a height of almost 14 000 feet. To reach its summit involves a two-day journey by pack train. More than once Professor Jaggar and other members of the observatory staff have made hurried trips to the top of Mauna Loa to observe at close range disturbances which were taking place there. Sometimes it has been a faint wisp of smoke in the distance, sometimes the records of the seismograph which have told the scientists that the subterranean forces were rousing themselves. One such disturbance occurred in September, 1919. There was a sudden gush of flame and fiery spume away up on the great flat mountain. This was followed by two days of quiet during which the pack train at the observatory was put in readiness. At midnight on the third day the watchers at Kilauea saw a dull distant glow far below the first break in the mountain side.

For these intrepid searchers for truth that glow was a determining piece of evidence. Off they started *toward* the scene of upheaval. These men in the observatory are not given to self-pity or self-praise and from all I could gather they considered this expedition merely a part of "the day's work." But to me it is comparable to cleaning out a nest of German sharpshooters on the western front. Without heroic devotion to the cause it would be hard to start toward a volcano when it begins to discharge. But it will be recalled that that is precisely what Pliny did at Vesuvius and these men out there in Hawaii fared forth in the same spirit.

For two days they rode and hiked across fearful, trackless country, attaining higher elevation as they went. Much of the region was strewn with Hawaiian "aa," or clinkery lava—hard as glass and jagged as the clinkers that come from the household furnace. But the long hours of painful progress were finally rewarded when the party came to a great rift in the earth. Here there came into view fountains of indescribable mag-

To Save an Industry From Sapiro Hands

A $3,000,000 Crop Is Being Kept Out of the Hands of Exploiters

By ROBERT MORGAN

Nearly 40,000 persons make their living during the greater part of the year in the Oregon hop industry, earning from three to thirteen dollars a day. Here is a group of hop-pickers, with the standing vines in the background, the cut vines in front, and their baskets of hops at hand.

WHEN the American people read in many of the newspapers and other publications of this country the effusive contributions of the publicity directors and press agents of those who are seeking control and domination of the American farmer, they must notice that there are some crops over which these "benefactors" of the farmer have failed to gain mastery. Among these crops are some of the largest in production as well as greatest in profit to the farmer of this country. Virtually all of these have escaped from Jewish control only after they have been exploited to some extent, and only after the producers themselves have put up a fight, often hard and bitter, but a fight which has been won by these farmers, and can be won by others.

The potato growers of Colorado are now going through such a battle; so are some of the grain growers of different states; the prune and apricot producers of California, as has been told in previous articles in this series, are now in the midst of such a fight. These contests are never recorded by the hired writers of the organization; indeed, in most cases the crops involved and the result of the fight which the American farmer has made to keep that which belongs to him are never mentioned.

Reading the productions of these panegyrists, one would believe that the Jewish ring never has had a failure; that the American farmer always has submitted to being "developed" and "improved" by these non-farming, agricultural "leaders"; and that everything is as merry as the proverbial marriage bell.

Nothing could be further from the truth. Every American farmer, fruit-grower, cattle-raiser, dairyman, or other producer who is a member of one of the co-operative marketing associations devised, controlled and operated by the Sapiro Jewish co-operative ring, is losing or has lost money which rightfully belongs to him. Every such farmer can learn a profitable lesson from the experience of those agricultural groups which have fought themselves free of this octopus. And the members of every such co-operative association may learn, if they will, from the experiences of the few who have won, how the many may be protected and saved.

The first industry of the state of Oregon is the production of lumber; the first in agriculture there is the growing of hops.

There are many uses for the product of the hop vine besides the making of beer. It is the principal component of yeast; it is beginning to be widely used in medicine; it furnishes the basis for several soft drinks, and it is involved in a number of the industries as well as one or two of the arts.

In Oregon, there are 13,000 acres of hops, producing 60,000 bales, or about 12,000,000 pounds, worth thirty cents a pound, a year. Approximately 40,000 workers are dependent upon this industry for a livelihood, and they earn from three dollars to thirteen dollars a day in the hop yards and drying kilns.

The average annual value of the Oregon hop crop for the past five years has been ten million pounds, selling for $3.000,000; this year it will exceed 12.000,000 pounds, selling for $3,600,000, or better.

This production and value formed a juicy financial plum which the exploiting ring could not long overlook. Agents of the organization, spreading laudatory propaganda of the alleged successes of the *"California Marketing Plan,"* the name under which the *Sapiro Plan,* previously described in these columns, operates, advanced on the hop-growers of the Williamette Valley and other similar sections of Oregon. The smaller growers, seeing what the prune-growers, the potato-growers and others once thought they saw in the "California Plan," rushed to join the new co-operative marketing associations. Quietly, even secretly in some instances, the promoters of these associations worked among the hop-growers, until they had signed up nearly eighty per cent of the number of individual growers. The remaining twenty per cent of the growers, *among them the largest hop-producers in the New World,* acted more slowly. This twenty per cent of the growers produce nearly ninety per cent of the hops grown in Oregon; the eighty per cent of growers who joined the association produce the other ten per cent. The twenty per cent who hesitated about joining the new scheme own and operate some eighty per cent of the acreage planted to hops; the 80 per cent of growers who were misled into the "California Plan," own or rent and operate, only about twenty per cent of the acreage. This is important to remember.

The bouquet which the Jewish farm exploiters tried to pluck and failed. The hop of commerce is the blossom of a perennial vine, and the valuable part of that blossom is the pollen, called "lupulin."

The owner of the largest hop yard in the world, located at Independence, Oregon, lives in San Francisco. He obtained accurate, inside information of the real results achieved by the Jewish ring in the exploitation of the prune and apricot growers. He investigated the poultry-men's associations, now beginning to wabble about after a few years under the Sapiro Plan. He probably learned, as the writer has learned, that it is only a question of time until the tribute which every hen in California pays to the Sapiro farm-exploitation organization breaks the hen's back and empties her owner's purse.

Other owners of large and productive hop yards likewise investigated—and stayed out of the co-operative scheme. For a few months—until the crop was ready for the market—the hop associations seemed prosperous. Then, for some reason, altogether aside from the depression of the war-period—which the independent producers likewise had to endure—things began to happen to the hop-growers' associations. The members discovered that their product was not being distributed so well, was not selling so rapidly, and was not bringing so good returns, as the product of the independent growers. As in the case of the prune-growers, the strawberry-growers, and a number of others, the Sapiro system of overhead began to eat up the profits.

And yet, to this day, there are hop-growers in Oregon who do not know that they were led into these associations by representatives of the Jewish ring. Some of these agents of the "California Plan" were Jews, but most of them were "Gentile fronts," of the same sort as those who are now endeavoring to saddle the scheme on all the other agricultural industries of this country.

The Oregon hop-growers who went into these associations, however, were very well able to get out of them. Oregon is settled largely by early American, British, Irish, Scotch and German stock. Men whose fathers hewed with axes a productive state from the fir forests of Oregon are not of the blood which stands idle while an alien group feeds upon it. They observed; they asked questions; and by this sort of active intellectual "co-operation" between Americans, the truth about the *"California Plan"* came out. It was the old story of control for purposes of exploitation only, and the members of the new co-operative associations fell away from them more rapidly than they rose to the bait when it was offered two years previously by the agents of the Sapiro scheme.

Today, the Sapiro Plan (call it the "California Marketing Plan," if you like) is as dead in Oregon as it would be in the Santa Clara Valley of California, if the Californians could free themselves of its grip. The hop-growers, seeing the predicament of the Sapiro "co-operatives" went still further in the real American spirit and method of co-operation, and bought the crops of the Sapiro co-operatives, *at a better price than the managers of the co-operative associations were getting for their members' hops.*

If this were not pitiful, it would be laughable. Here were Americans producing millions of pounds of the leading farm crop of a great state, owning their own lands and homes, creating wealth by their own labor, yet paying tribute to a ring of professional aliens, and compelled by the operations of these exploiters, to dispose of their crops at less than the market price, so that other Americans, working independently, could distribute those crops for the men who were bound up in the co-operative associations!

In spite of these conditions, the Oregon co-operatives stayed with the Sapiro scheme for nearly three years. How much the exploiters of the hop-growers obtained, no one knows; probably the hop-growers do not themselves know, accurately, but the amount must have approximated the more than $2,000,000 which the prune-growers lost in a little more than two years, as previously described in these articles. In this catastrophe, some fifty hop-growers were put entirely out of business; the remainder, several hundred in number, survived, solely because real Americans stood by them when their "friends" at the head of the Sapiro co-operative associations proved themselves either incompetent or unwilling—in either case unable—to handle the business of the associations in a successful manner.

Here then, in the warm interior valleys of Oregon, was staged a fair test of the value of the co-operative plan in American agriculture. The independent growers were not hostile to co-operation;

(Concluded on page 15)

A hop-drying plant, with the wagon loads of sacks of hops coming in, each sack containing nine bushels of newly-picked blossoms.

On Sunday Observance

This report of M. Wayne Womer, Secretary of the Lord's Day Alliance, is not a Michigan item alone, but offers a picture that is common. Sunday is religion's gift to the worker. He will be first to suffer when it goes.

THE Sunday law in Michigan is not so bad if it were enforced. It has its shortcomings to be sure, but no law would be of value unless enforced. *Law is but the expression of a people's morals* and without a live public conscience the most perfect law would be a dead letter.

The Michigan Sunday law may be dead but not forgotten, from the fact that the Supreme Court of the state has handed down decisions this year sustaining the law as in the case of the appeal of one Karl Kramer, convicted bootlegger whose appeal was based on the fact that he was arrested on Sunday. The court, in rendering its decision, upheld the Sunday law claiming that it had not been violated and sustained Kramer's conviction. Yet *the only parts of the Sunday statute that are not violated* are those sections referring to prize fights and open barber shops.

There are two things that should be said about this law. *First,* there is what is known as the Home Rule Act whereby cities and towns of 3,000 or more population may define by ordinance what shall or shall not be done on Sunday.

Second, Special legislation; for instance, commercialized Sunday baseball is *legal in Detroit,* but *illegal anywhere else* in the state.

People everywhere are asking why conditions are as they are. The law as it is modified by the Home Rule Act, almost entirely unenforced and unenforceable, presents a condition that makes it impossible for better Sunday observance.

Courts Not in Sympathy

THE courts are not in sympathy with its enforcement and experience has proved all efforts futile. Police commissioners, mayors, prosecuting attorneys, have a state of mind that might be defined as quiescent. Our chief executive, the governor, when visited by a delegation of ministers protesting against the building of highways on Sunday, said, "I consider the building of the highways of Michigan on Sunday as necessary as the operation of a hospital."

Finally, to which should be added, the root of all the trouble, the dead conscience of the people which is illustrated by a recent telephone message. "No," said the pastor, "our officials believe it would be unwise to have a representative come at this time. The people of the community are building their homes on Sunday and something might be said that would give personal offense."

We have sought to ascertain conditions rather than to change them.

The State Fair. We protested to the governor the opening of the gates of the State Fair on Sunday upon the grounds that the fair was under the Department of Agriculture and supported from the State Treasury and in so doing the state thereby violated one of its own laws. The governor referred it to the manager and no action was taken.

However, we have been more successful with the County Fairs. After addressing the County Fair Association of the state, we were given assurance from both the chair and the floor that the County Fairs would remain closed on Sunday.

Street Carnivals. We protested against the Street Carnivals, seventy of which were upon the streets of Detroit last year, and without exception left a trail of vice and crime in their wake. Mayor Martin assured us of his entire sympathy in the matter and personally believes that they should not be permitted to open on Sunday and that he would so recommend to the council.

Helpful and Wholesome

BAN on Motion Pictures. The Alliance protested against the exhibiting of Mabel Normand pictures in the state. The pictures were advertised for Sunday and in the advertisement they sought to capitalize the unfortunate situation of this twice unfortunate motion picture star. Some people called us foolish and others denounced us but when the motion picture theater owners' association met to consider the protest they voted 100 per cent in favor of it. The ban was kept on for three months until after every state in the Union had lifted it and every censor board had removed it and even then the association refused to consider its removal until the Alliance had given its consent. The courts having failed to find Miss Normand guilty or implicate her in the guilt of the shooting, we gave our consent upon condition that if Miss Normand was found guilty or implicated in the guilt the ban was to be restored.

Out of this incident came a helpful and wholesome thing. The Motion Picture Association sent a letter to all the producers of the country that in the future a character clause would be required in the contract of all stars and when they sidestepped the bounds of decency and right-doing, their contracts would be automatically canceled.

In the light of all facts, it is plain that the district attorney and the judges at Detroit acted in harmony with the district attorney and judges of other states as our telegrams from the district attorney revealed. In the words of the old song, "They were all doing the same," that is, acting in accord with the ruling handed down from the Attorney-General at Washington. We are anxiously waiting to see what the ruling of the new Attorney-General will be upon this matter.

In conclusion: we have sought in every way to quicken the public conscience upon the matter of Sunday observance.

Manhattan's Sphinx—A Sketch

Murphy a Man of Deeds, Not Words

By PETER SCHUYLER

CHARLES FRANCIS MURPHY, fourth of the line of kings of Tammany Hall, was one of the real men of mystery of Manhattan, a veritable descendant of the Sphinx. A political harmonizer whose gifts amounted to genius, he was hated by his enemies and loved by his friends.

Of all the newspapers which for years had made their battle cry, "Murphy Must Go," there was not one which had the courage to say about him dead what it had printed about him alive.

On one occasion when Murphy was being badgered for a reply to a vitriolic onslaught made upon him, he spoke the whole philosophy of his public career. "No man has the right to be called a leader who is unwilling to take abuse," he said. Not a bad statement for a man who mounted from a crosstown horse car to the throne of "the largest Jewish city in the world." He never answered attacks. He did not even ignore them. For him they were automatically non-existent.

He did not laugh at his opponents when he had beaten them, as he generally did beat them. He did not crow—publicly at least—in victory. He took what came in the spirit which gave him his first nickname —"Sport." That may have been why the reformers hated him. He trounced them soundly and was on one or two occasions castigated by them just as severely. To the very end of his life he "out-gamed" his foes and took his medicine with far fewer grimaces than the politicians who continually yowled for his head.

If Murphy was the Riddle of Manhattan to the uplifters, who never guessed the reason of success, obvious as it was, he was just as insoluble a puzzle to his intimates. He never talked for publicity purposes, and he froze obnoxious and unfriendly questioners. But counselors, friends, petitioners, supporters, and "Plain People of No Account" always found that he heard clearly and acted promptly, especially the "Plain People of No Account"; for in listening to them and attending to their difficulties lay the real secret of Murphy's power.

Profiting by Experience

MURPHY came from the people and he never forgot it for long. There was a time when the council chamber of Tammany Hall was moved from Fourteenth street, hard by the old Bowery, to an upper room in Delmonico's restaurant at Fifth Avenue and Forty-fourth street. That is the period sneeringly referred to by the dead man's journalistic antagonists as the occasion when "Murphy hired a good tailor and mixed with the social game." Whatever idea caused the shift of Manhattan's throne room, whether it was the urge for a wider sartorial horizon or a craving for a larger acquaintance among Manhattan's best people, no one will ever know.

Murphy may have grown tired of pants that bagged at the knees and intimates who talked out of the side of their mouths, when he moved from the schooner of beer section to the iced champagne quarter of the city. Perhaps he wanted to find out what was the difference between the gang downtown and the gang uptown. Perhaps he was moved by a sense of cynical curiosity to find out whether the people on the Avenue who came down hat in hand for a favor to his bare business office near the old Bowery would be any different if he went where they could find him in surroundings more in keeping with their usual environment. At any rate, his stay on Fifth Avenue was brief, and he returned to the Wigwam where he stayed till he died. It is safe to say, however, that what he went after at Delmonico's he got, whether it was an enlarged social perspective, the address of a tailor, or just knowledge.

A few years ago a supreme court justice was up for re-election. Murphy refused to ratify his nomination, and the judge was put back onto the bench by a huge shove from the voters and Murphy's man was lost among the ballots. A short time afterward Alfred Talley, who had made a fine record as an assistant district attorney, was urged for a place on the judiciary ticket Murphy, at least it has been so stated, refused to endorse him. As soon as it became known that the Tammany boss had turned his thumb down on the Talley boom he was savagely attacked. Lawyers without regard to party affiliations swarmed to Talley whose integrity was such that it had won him unqualified respect. Murphy was wiser than he had been at the time of his refusal to endorse the supreme court judge. He had been taught a lesson and remembered it. Talley was placed on the ticket and elected with the full support of Murphy.

Never Lost Touch With People

MURPHY never lost intimate contact with the people from which he had sprung; for whom he had an open ear and a willing hand. He had served a hard and vigorous apprenticeship in an East River shipyard when a boy. Never quarrelsome, he could always take care of himself. He was an excellent ball player as a youth, and was the manager of a successful amateur club for which he was catcher. Under these circumstances he became well acquainted with the residents of the district in which he lived. He proved to them that he was "a good sport," and when he laid down the hammer of a shipyard worker to take up the reins of the crosstown horse car his circle of acquaintanceship broadened. He accumulated five hundred dollars during his three years of service as the pilot of the street car, a fact which was stressed in his newspaper biographies.

One of the outstanding features of Murphy's life is that no one "got anything on him." The attempt to do so was unremitting—and futile. During his long control of Tammany, Murphy had political intimates with whom he later disagreed, and who swore an undying vendetta against him. The breach in many cases was never closed. The enemies so made were men of influence and good haters. They never lost an opportunity to bury the knife in "The Chief," and their animosity was so intense that they would have stopped at nothing if they could have destroyed him.

If Murphy had been dishonest they would have known it. Solo crooks are impossible in the political world.

His foes were in the habit of saying: "Wait till he dies and see the millions he leaves." Murphy died, and his will disposed of wealth to the extent of less than half a million dollars. To most persons that is a great sum; but for a man accustomed to handing out patronage which in the long years of his political control of Manhattan amounted to billions, able without the exercise of any obliquity to use for his financial betterment knowledge which came to him in the course of his activities as one in close touch with city affairs, Murphy's fortune is puny. But it is the best answer to his critics.

What the Policeman Said

HE IS said to have been open-handed in his charities. Like every other phase of his life, that also is shrouded in silence. If he gave, he said nothing about it. But up the steps of the unpretentious brownstone house where he lived when in the city there poured after his death a throng of "people of no account," to pay their respects to the man who had never failed them. There were also women and men of social and political prestige, lawyers and judges and clergymen of all creeds; but they were outnumbered a hundred to one by those who were none of these things, the people whom Murphy had never forgotten and for whom he had done something.

They were in most instances what are described as "the poor." They went in genuine sorrow to look for the last time on a man of impenetrable mystery who had listened with inscrutable face but open ears for a lifetime to their tragedies, their troubles; the problems which swamped them and frightened and perplexed them. Murphy had stood between them and misery of some sort or other. While they came away from his office no wiser about what he intended to do for them than they were when they entered it, they found out later that the thing they wanted done had been done.

There is in Manhattan a policeman with whom Murphy in the almost forgotten time when he was nothing politically, used to walk on his beat. Long into the night the policeman and his dumb young companion used to ramble together, the policeman talking, the young man listening. Murphy went up the ladder of success rapidly. The policeman remained, just a policeman. He might have been made an inspector, but Murphy never made him anything. For twenty years they did not meet or speak to each other directly. But the policeman in the course of his duty ran across many people who were in distress. He did what he could to relieve them. But some of the difficulties even a Manhattan "cop" could not straighten out. They needed a more powerful hand. So the policeman would say to the troubled one: "Go down to Fourteenth street and see Murphy." "But I don't know him and they won't let me in to see him," would be the answer. "Tell them I sent you and they'll let you in. When you get in tell Murphy I sent you and tell him what you have told me."

What Murphy Accomplished

THE ORDER was obeyed and the policeman's name was the password. Frightened to death at the changeless face of the leader of Tammany Hall the story of distress would be stammered forth. Murphy would listen without a word. He might nod. He might not. Then the petitioner would withdraw, sweating from every pore and quite sure "the boss" was everything bad that had been said about him. But next day the trouble would be over, the want appeased, the appeal answered, and all because of an inarticulate friendship between Murphy and a youthful companion with whom he had not spoken a word in a score of years. It was that sort of thing which made Murphy's control on a gigantic political machine something which neither attack from without nor dissension from within could shake.

He had the faults of all professional politicians; but he had virtues which most of them lacked and of which political reformers as a class are singularly devoid. He took care of his people.

No one who knew the man and knows Tammany Hall would try to make a halo for Murphy's picture. Murphy would not have stood for it himself; but to say that he did nothing good in his political life is altogether false. He took Tammany Hall when it reeked with the thievery of Tweed, the viciousness of Kelly, and the brutal contempt for decency of Croker, and he made it as respectable as a political machine can be. When he ran a saloon no woman ever crossed its door. Little by little he cleaned up Manhattan of thieving, flagrant immorality and widespread gambling. He picked men of character and integrity for public office when he could get them. He left Tammany Hall far, far better than he found it. To do that is an achievement which only those who know its history can properly estimate. "The plain people of no importance" will miss him.

The Wonder Voyage From Marseilles to Malta

By HAL WALKER

Marseilles—Church of Notre Dame de la Garde.

SAILING to the oldest of known waters to see with one's own eyes the sea itself where sailors braved the storms in cockleshell boats long before the Christian Era, the lands adjoining, tales of which have come down to us in the writings of ancient Greeks, and even the Holy City itself, Bethlehem and the Mount of Olives, is apt to give a thrill even to the experienced traveler.

Half-forgotten school history and later reading crowd into the mind in fragments in sailing out of the harbor of Marseilles on one of the liners of the French *Messageries Maritimes* line, past the Chateau d'If, which brings remembrances of the Count of Monte Cristo. Piercing the sky line, the statue of Notre Dame de la Garde seems to be giving benediction and safe passage to those who go down to the sea in ships, even more strikingly than does the Statue of Liberty welcome immigrants to the promised land in New York Harbor.

There are several ways of going from Western Europe to the Levant: the journey can be made either by rail or water, but it is generally agreed that the most comfortable trip and the most interesting is that by water. Most persons are averse to getting out in the middle of the night when crossing frontiers by train to have a baggage examination, and this happens often on the rail trip from Paris to Constantinople, for instance. The water route is cleaner and does away with that sort of vexation.

Leaving Marseilles, which was founded by the Phoenicians, supplanted in 600 B.C. by a colony of Greeks from Asia Minor who gave the port the name of Massalia and a shipping impetus it still retains, the traveler visits Naples, Valetta (Malta), Piraeus (Athens), Smyrna, Constantinople, Rhodes, Cyprus and Beyrouth. Inland from the leading port of Syria, the wanderer sees Damascus of his dreams, Aleppo, important desert towns, Baalbek in ruins, and then by train to Jerusalem, Port Said and back to Marseilles by direct steamer in five days. Of course from Jerusalem a trip can easily be made direct to Cairo and the Nile. With all the calls made by the outward-bound steamer, Beyrouth is reached in less than two weeks, with the advantage of being in a different port and country every other day of the voyage.

Malta—Harbor of Valetta.

In discussing steamship lanes, it might be of interest to readers at home to explain the manner in which the French steamship companies divide the world. There is no competition among the principal lines; their whole competitive effort is directed against foreign companies which, perhaps, is the secret of their success.

The *Messageries Maritimes,* which is the oldest French company, works wholly eastward from Marseilles, to the Eastern Mediterranean, through the Orient, Australia and the east coast of Africa, including the islands of Madagascar and Reunion which are French possessions.

The *Compagnie General Transatlantique,* better known as the French Line in America, runs its de luxe service from Havre to New York, lesser lines to Mexico, Central America, Cuba and New Orleans, and operates to North Africa and the African west coast from Marseilles.

The Fabre Line from Marseilles has its main service to New York by way of Italy, North Africa, Portugal and the Azores, while a fourth takes the Argentine and Brazil from Bordeaux.

I had the good fortune on my first trip to the Near East to be attached to an official French mission of both business and professional men. In this way I had a greater opportunity of sight-seeing en route and, after arrival in Syria, also a better chance of studying industry, than would be possible for the usual tourist in a much longer time. The mission was bound for Syria to study commerce, production and industry and the progress made since France took the mandate from the League of Nations and placed General Gouraud as High Commissioner in Syria and Lebanon.

At every port agents of the steamship company supplied motor cars for the visit there, and the French consul aided in giving us the most possible information and sight-seeing in the shortest time. We did not have to bother with professional guides and so got along much faster and more efficiently.

Leaving Marseilles at four o'clock in the afternoon on the liner *Pierre Loti,* just as the city became a haze astern we ran into a fierce rain which lasted for an hour or more. This was the only rain we saw during six weeks in the East and until we were approaching Marseilles on our return, only a few hours from port. There was continued sunshine and never a blow at sea; in fact the sea for the greater part of the trip, both going and returning, did not have a ripple on its surface. For most of the daylight hours the following morning we were coasting along the island of Corsica, the ship being out of her course and well inshore so that members of the mission could get a good view of Bastia and other towns along the coast, as well as the cultivation of the hillsides.

Thirty-six hours from Marseilles and we approached Naples with Vesuvius smoking in the background. Everyone at home who goes to Europe, I suppose, goes to Naples; it is one of the places one doesn't miss, any more than London, Paris, Rome or Venice. On my first visit to Naples the youngsters in the streets were all beggars, and strangers were their victims, so when they failed to get pennies for the asking they inflicted punishment by a barrage of overripe fruit.

Naples on this second occasion behaved better, probably because we were all in motors and the beggars did not have a chance. We spent several hours touring, with visits to the principal churches and museums, and in the afternoon went to Pompeii which is ever interesting no matter how many times one returns. These homes, overwhelmed so many centuries ago, and bodies of the victims in perfect preservation as they were suffocated by the hot ashes, hands covering eyes and mouth, give a graphic picture of the forces of nature holding sway and serve to emphasize what a puny thing is man.

Just as the shadows of evening were falling we steamed out of Naples, one of the most beautiful of all world harbors, the rays of the setting sun bringing the stone houses and red roofs of the city into strong relief, while farther afield under the trees of the hillsides nestled other tiny houses, doll-like in size in the distance compared with the nearer ones of Naples itself. And over all was Vesuvius brooding and slowly smoking like a giant at rest.

Past Stromboli we steamed in the night and in the early morning were approaching the Straits of Messina, that little body of water between Italy and Sicily which, according to the Greeks of old, had the two monsters, Scylla and Charybdis. The former was on the Italian side and reached out with huge claws to drag sailors from the decks of their ships, while Charybdis sucked whole ships and their crews into her waters.

The Straits of Messina, with the city of that name on the Sicilian and Reggio on the Italian side, never have the same appearance twice. Either very early in the morning, as on this occasion, or late at night I find the passage the most beautiful. We arrived shortly after daylight before the sun had really touched the waters, although it was shining on the hills. The Straits were crowded with fishermen placing their nets, brown men and brown nets in light blue boats on a sea darker blue, and they were singing as they worked.

Passing the Straits after midnight, when the ferry has stopped running and the fishermen are at rest, there is nothing except dark blue water underfoot, a lighthouse or two, and on both sides, as the land rises, thousands upon thousands of electric lights in the streets of both cities covering the hillsides. Then about midday, when coming through from the north, the sun makes a sheet of gold on this narrow strip of water. While away off, the land on each side slopes down to meet this sheet of gold; beyond there is nothing, and the scene creates the impression that beyond the golden sheen there is only an abyss, a void into which the ship must plunge.

As the towns of the Straits fade astern, Mount Etna makes its presence known by lazy smoke pouring from her craters, more beautiful in the winter when mantled in white with clouds of steam rising from the melting snow near her summit. In summer Etna is bald and rugged, defects which the snow hides mercifully.

Skirting the coast of Sicily and passing in sight of the prosperous town of Syracuse, then out into wider waters, calm and peaceful, Malta loomed a speck on the horizon dead ahead late in the afternoon. Two hours before sunset the *Pierre Loti* came to anchor in the perfect harbor of Valetta on the northeast coast. Malta is the stepping-stone of British dominion of the seas between Gibraltar and Aden, as a fortified spot, and it is here that the British East Mediterranean fleet is based. The ancient fortifications were constructed by the Knights of St. John, but the British have done something themselves in the way of fortification which leaves the works of the Knights of Malta in the discard.

The harbor is deep and well protected from the storms, and vessels tie up with stern lines to the quay and an anchor in the stream. Boatmen abound and take travelers ashore to the customs landing for two pence. There is a British sergeant always on duty at the landing stage and seldom is an attempt made by the boatmen to overcharge. This is one of the things the British do very well in their far places; they publish a fair tariff for boatmen, porters, ricksha coolies, post notices of the prices and warn strangers not to pay more.

Valetta, except for her ancient walls, is as English as London itself. English is spoken everywhere; the shops are full of English goods and the bars of Scotch whisky and stout, while there are tennis courts, polo fields and a race track for amateur sports.

It is quite a climb from the waterfront to the park overlooking the harbor, and so a huge elevator has been installed for those who are pedestrians, the price of the ascent being two pence, which seems to be the regular charge for any small service.

More to make Valetta remembered rather than its elevator, on the quay-side are numberless goats which wander or are driven through its streets, thronged with traffic at the very hours when the goats are there. Goats supply the milk for the population and at nearly every door there is a miniature stanchion to which the milkman tethers his goat while he milks the amount demanded by the customer into a dish supplied by the latter.

This is the first of several articles describing this voyage. Further laps of the journey will appear in early issues.

Naples—The Bay and Vesuvius.

Social Credit as Defined by Major C. H. Douglas

English Publicist Says a False Psychology Threatens Civilization

By WILLIAM WILSON

SHORTLY after the cessation of the Great War, when everybody in England was optimistic and busy, Major C. H. Douglas wrote a book. It was not a popular work by any means. It was dry. It was technical. And it involved new and unpleasant ideas. It actually said, for instance, that industrial affairs would shortly show signs of breakdown, and that warfare had not been swept off the earth so surely as newspapers reported.

This book remained alive, not because it was popular, but because the things it foretold became facts as the months passed. At the present time the Douglas book has grown into a library, and the Douglas idea is discussed in every industrial country.

This article offers, in a very rough form, some of the lines of thought given in Major Douglas's newest book, "Social Credit."

There are two ways in which a question can be viewed: the moral way, that dealing with right and wrong; and the mechanical or scientific way, that dealing with cause and effect. Doubtless each of these methods of thought has its place in the nature of things, but should they by evil chance become mixed up in a single line of argument, then confusion will surely result.

The ideas behind present-day economic and financial problems are suffering from just this confusion, resulting from half-moral and half-scientific judgment. Moralists the world over are frantically preaching "a change of heart" to masses of innocent and despairing people who are being made the scapegoats for *faults that lie in the very machinery of economics*, and which can be remedied only by the people controlling that machinery.

To allege that a change of heart is the sole remedy for the evils threatening the world is not only a gross injustice to millions of individuals, but is also a wide stretch from points of fact. Indeed, were it possible to transform the peoples of all communities into saints overnight, there would yet remain faults in that abstract, cold, relentless machinery of distribution—money—that would have to be corrected before further industrial progress would be possible.

Let us, then, waive morals for a spell, and come down to hard facts.

It is a fact that, the world over, goods and services can be produced and delivered up to an amount far in excess of the world's desire to consume: *there is no real shortage of anything.*

It is a fact that, under favorable circumstances, 25 per cent of the world's population working seven hours a day could make and deliver everything that might be demanded, even including luxuries.

It is a fact that the introduction of a horsepower-hour of energy into the production process could, under circumstances ordinarily favorable, displace at least ten man-hours.

It is a fact that the amount of mechanical energy at present available is only a small fraction of what it could very rapidly be if effort were directed toward that object.

It is a fact that unemployment is a permanent, though a fluctuating, factor in every nation's economics. *And it is a fact that never during the past 50 years has any industrial country been in a position to be able to buy its output with the money its individual members have received in wages, salaries, profits, and dividends; every community, in short, has been forced constantly to find export markets for a "surplus."*

Strangely, these two sets of indisputable facts are as oil and water—they will not combine. If closely considered, the reason for this will be found to rest in certain moral considerations that have intruded into a purely scientific process.

The Machinery of Distribution

IF WE are to be led by "right-and-wrong" arguments, if we are to accept as final the psychology of "rewards and punishments" that permeates the whole fabric of life today, then employment must necessarily be our sole aim, since we are taught that idleness is sinful, and that if we do not work neither shall we eat.

And if work is to be our object, then our highly efficient productive processes must be considered to be essentially harmful, since they tend to create leisure. Conversely, wastefulness, "ca' canny" and war preparation might well be upheld insofar as they keep men busy.

If, on the contrary, we decide to take a scientific attitude, we must be prepared to disregard any moral conceptions inherent in employment, and to search for an efficient means, other than work, of distributing the stupendous quantity of goods that the most up-to-date processes can produce.

This leads us to a consideration of the machinery of distribution—money.

There is no wrong in money as money: it is as necessary to efficient distribution as are tickets to railway traveling. It is the policy underlying the issue and control of money that is at fault.

One obvious result of this policy is that of subordinating the individual to the group. This tendency can be recognized in every stratum of society and industry. And it is safe to say that as a rule the individual sacrifices more to his group than he receives in return.

"Pre-war Germany was always exhibited as being reactionary, feudal, and militaristic to an extent unequaled by any other great power. Post-war Russia is supposed, by large masses of discontented workers, to be the antithesis of all this. But the similarity of the two is daily becoming more apparent, and it is notorious that the leaders of pre-war Germany are flocking to post-war Russia in increasing numbers, in the lively hope of the fulfillment of the ideals which were frustrated by the Great War. The latest pronouncements on industrial affairs by Russian statesmen are indistinguishable from those of American, German, or British bankers (which statement is not intended as undiluted praise) . . . .

"No consideration of this subject would be complete without recognizing the bearing upon it of what is known as the Jewish Question; a question rendered doubly difficult by the conspiracy of silence which surrounds it. At the moment it can only be pointed out that the theory of rewards and punishments is Mosaic in origin; that finance and law derive their main inspiration from the same source, and that countries such as pre-war Germany and post-war Russia, which exhibit the logical consequences of unchecked collectivism, have done so under the direct influence of Jewish Leaders. . . . The Jews are the protagonists of collectivism in all its forms, whether it is camouflaged under the name of Socialism, Fabianism, or 'big business,' and the opponents of collectivism must look to the Jews for an answer to an indictment of the theory itself."

A notable fact in regard to this group-forming tendency is that responsibilities dear to the honor of individuals tend to lose their significance with a group. The actions of groups affect individuals precisely as do the actions of individuals. An obnoxious feature of the exaltation of the group above the individual is that it lends itself to subtle arguments around certain abstract and ill-defined words such as justice, freedom, equality, democracy, arguments that, while creating a mental excitement toward so-called "ideals," actually blind their adherents to the enslavement into which the group-idea is forcing them.

Prices and Increased Production

THE "right to strike" is a high-sounding group-phrase which, to the individual, means practically "the right to starve."

"Where one party to a controversy can only obtain the means of subsistence by 'working,' while the other party can continue, if not indefinitely, for a very long time, by drawing checks on institutions which, if necessary, can create their own deposits, the right to refrain from working merely amounts to a right to commit suicide."

Another feature inherent in the financial policy of the invisible government is that of giving a wrong conception to the word "value."

"In the nature of things, the value of an article should reside in its serviceability toward a given end. The value of a boat, for instance, should consist in its ability to support on water some person needing or desiring such support."

But the orthodox financial conception of the boat's value rests mainly on the ability of the person desiring to use the boat to pay money to the boat-owner. The more urgent the travelers' needs and the fewer the boats, the higher will the value of each boat become.

Thus it arises that scarcity creates value. And, as "business" deals in values, it is logical to find that it has a great interest in scarcities.

The impression of scarcity can be maintained in two ways: by holding back supply, or by stimulating demand. Each of these scarcity-producers is worked efficiently.

Supply is restricted in a hundred subtle ways. Machinery is run at short capacity; workmen shirk; strikes and lockouts are on the increase; waste of potentiality can be found everywhere, and culminates at intervals in the wholesale destruction of warfare.

Demand, on the other hand, is kept at a maximum by advertisement.

"There are few people who would claim that the money systems of the world are perfect, and the number of such persons is decreasing daily. But when asked to define the various defects in the money system, it is quite remarkable to notice with what monotonous regularity these ideas of 'justice' and 'value' are paraded.

"It is claimed that money is defective because it is not an accurate measure of value, or that it results in an unjust 'reward' for labor, but when such critics are asked to suggest a method by which the relative value of a sunset, and say, the Venus di Milo, might be assessed, on the one hand, or, on the other hand, what is the 'just' return for a given amount or variety of labor, their answers are not usually very helpful from a practical point of view."

"It must be recognized that the great elementary human emotions, desire and fear, are employed with great skill by the Invisible Government, in the guise of rewards and punishments. . . .

"A system of world organization which is based on the deception of the general public. . . (which might perhaps have been excusable in the past) has now become both undesirable and actively and practically vicious. . . . .

"We have reached a point at which we are within sight of a considerable release of human energy from the mechanical drudgery of existence by toil. . . . So far from the mere sustenance of life. . . . being the prime object of human endeavor, it should now be possible to relegate it to the position of a semi-automatic process."

Certain fanatics have suggested changes that would, if applied, certainly spell calamity to mankind. The few in power are taking advantage of these erroneous arguments to lead the masses to believe that any change whatever will prove disastrous.

This is serious, because, in the most practical sense, our economic machinery *must* be subjected to an improvement of some sort in the interest of civilization. The change will come whether we prepare for it or not.

The fact that a few people are very rich while a great many are extremely poor leads many writers to blame riches for the scourge of poverty. Here is a huge error. *The big point is not that the power to purchase is badly distributed—but that it is collectively insufficient.*

Another gross misconception rests in the belief that bank loans are granted from a fund of bank deposits. This is absolutely antagonistic to facts. On the contrary, deposits are created by the circulation of bank loans. Probably fifteen-sixteenths of the immediate available purchasing power in the world arises out of bank loans or their equivalent.

The only limit to the issuing of new money in the form of loans is that arising in shaken public confidence as a result of inflated prices. When this strain on confidence nears breaking point a halt is called. Loans are called in; purchasing power is destroyed; a slump ensues.

The public would have less cause for complaint were it assured that, at boom times at least, there would be enough money in circulation with which to absorb the goods available. But, since every penny of new issue ultimately gets hitched to the price figures, even this scant consolation is denied them. Hard experience has taught that *inflation means prices that are too high*, while *deflation means pay that is too low.* "Heads I win; tails you lose," says High Finance.

"It is fair to say that almost any explanation which is *not* a full and accurate explanation of the working of the financial system has the curious result of playing directly into the hands of the upholders of that system."

Thus, when the Labor-Socialist emphasizes the contrast between rich and poor, supporting increased taxation, death duties, levies on capital, and so forth, he is acting directly, albeit unwittingly, in support of the tenets of High Finance.

"There is probably not a 'leveling-down' movement of any description anywhere, which is unsupported from Lombard Street, Wall Street, and Frankfort."

The final factor in the urgency to improvement rests in the degree of the financial control of prices. It is clear (as with Germany and Russia) that banking institutions can, if they so desire, force prices up to any level by the issue of new money; and, *theoretically*, by the restriction of credits, they can reduce prices to any degree. Actually, however, the power to reduce prices is limited, because the willing seller disappears directly prices have dropped to the level of fixed charges.

It is apparent, then, that *High Finance is incapable of reducing prices below overhead cost*, and since overhead costs are steadily increasing in relation to labor cost, it follows that the minimum level of general prices must rise constantly.

That this is true may be recognized in the fact that although rapid progress has been made in efficiency processes since 1914, although the world's potentiality to produce and deliver goods has advanced, at a low estimate, 50% to 100%—*yet, except in the case of certain well-defined commodities, not a single country can boast of lower prices as a result.*

Now, when the minimum price-level passes a certain point, deadlock ensues merely because every party to the contract becomes a loser. The mining industry in England has arrived at its logical financial destination; so has housing, and transport is not far behind. The price of coal in England is prohibitive—thus *the consumer loses*; the wages of English miners are too low for decent living—thus *the workman loses;* the profits of English mine-owners are practically non-existent—thus *the capitalist loses.*

Money for Consumption

NATIONS are running rapidly to the same impasse. If all budgets are to "balance," and all trade balances are to be "favorable," it means (quite apart from the fact that the assumption is an impossibility) that nations, like individuals, are all playing a losing game.

"The consumer cannot possibly obtain the advantage of improved process in the form of correspondingly lower prices, nor can he expect stable prices under stationary processes of production, nor can he obtain any control over the program of production—unless he is provided with a supply of purchasing power which is not included in the price of goods produced. . . . . There is only *one source* from which it (such a supply of purchasing power) can be derived, and that is *the same source which enables a bank to lend more money than it originally received*—**the general credit (The Credit of the Community).**"

At present, financial institutions issue money for production only. And this money is only passed on to consumers through production—labor. But, since the prices of goods or services produced by the average man are far in advance of his wages figure, it is evident that there must always be an unconsumable surplus of goods in each community. True, this surplus can be bought with fresh bank loans; or it can be wasted in a score of ways: or it can be loaded on to unwilling neighboring states in the form of exports—or gas bombs.

The gap existing between productive efficiency and distributive ability is so wide that peaceful methods of alleviation are becoming more and more impracticable.

Organized destruction—war—is becoming *actually necessary* to the upkeep of the machine to which Finance would tie mankind.

To solve the problem it will be necessary to inaugurate a system controlling and distributing purchasing power at a rate sufficiently rapid to allow of the consumption of the maximum output of industry. This can only be effected by the issue of money *for consumption*—money that will not be added to prices, and the sole function of which will be the delivery of goods to individuals.

Why Bootlegging Flourishes

IF THERE were no buyers of liquor the bootleggers would soon be out of business, and those who encourage the illicit traffic by their patronage are as morally guilty of breaking the law as the bootleggers themselves.

It has long been an axiom that in the case of theft the receiver of the stolen goods is held to be equally guilty with the thief himself, and frequently his punishment is just as severe, in some cases even more so.

It is therefore a cause for national humiliation to find that those who are considered "respectable citizens" aid and abet this pernicious and unlawful traffic in bootlegging whisky, making regular purchases from underground sources.

How can these men free themselves from the charge of being instigators of crime? How can they square such conduct with the ethics of Christianity? Is it not high time that the citizen who violates the law of the land and outrages common decency in this fashion should examine his conscience; should ask himself if he is playing the game?

We are quite well aware that there are those who abide by the theory that if a law with which they do not agree is put on the statute book they are at liberty not only to ignore it but to break it to their heart's content. Just imagine, however, what it would mean to this country, or any other country, were any very large section of the population to adopt this code. Nothing could follow but administrative chaos and lawlessness, and to this twofold abyss those who in their folly wilfully set the liquor laws at naught are driving the nation.

It is essential to the proper government of any country that the laws should be obeyed. If the people think that they are not good laws, they have their remedy at the polls, but while these laws are allowed to remain and are considered necessary by the majority for good government, it is the duty of every citizen to obey them.

Bootlegging flourishes upon what it feeds; it is fostered and nourished by the people who accord it support, not from any altruistic or generous motive, but merely for their own self-gratification.

This is selfishness, and selfishness is one of the characteristics that men most despise, for it lies at the root of much of the misery in the world. Let a more generous spirit prevail, and let the good of the whole be considered—not the indulgence of the few.

Not Americans Alone

AMERICANS with their undeniably splendid record are so accustomed to regard themselves as foremost in every field of research that the recent medical discoveries of a Canadian and an Australian will serve to remind us that our cousins have the same spirit of scientific adventure.

The discovery of insulin as a treatment for diabetes has made young Dr. Banting, of Toronto, an international figure.

Now comes our own Dr. William J. Mayo, of Rochester, Minnesota, back from Australasia with what he terms the "astonishing" discoveries of Dr. John Hunter, the twenty-seven-year-old professor of anatomy in the University of Sydney, Australia. Dr. Mayo was in Auckland, New Zealand, attending a convention of the Australasian branch of the British Medical Association.

"Among the discoveries of Dr. Hunter is a treatment for spastic paraplegia, an affliction common among World War veterans, caused by injury to the brain," Dr. Mayo declared.

"Another is Little's disease, found in certain forms among children who cannot control their movements. A third is for certain Parkinsonian syndromes, allied to shaking palsy."

These diseases have hitherto been considered incurable.

While Sydney has been attracting much attention of late by beginning the construction of the largest arch bridge in the world across its world-famous harbor, Dr. Hunter has performed these notable services for mankind and given his institution worldwide prestige.

Incidentally, Dr. Mayo makes a much better special ambassador to Australasia than the average politician who goes abroad to wave the Stars and Stripes at conferences. Such unofficial missions as Dr. Mayo has just concluded are of the utmost value to all English-speaking countries.

Advertising

THERE is at present in session in London, England, the twentieth annual convention of the Associated Advertising Clubs of the World. A goodly proportion of those attending the convention are Americans, and American methods in publicity are engaging the attention and attracting the admiration of the advertising men on the other side of the ocean.

Not only are the business men keenly interested in all that is going forward at these meetings, but so also are the press and pulpit. The ethics and uses of advertising have been made the subject of addresses delivered in Westminster Abbey, the Roman Catholic Cathedral of Westminster, and other churches.

In the Abbey, the Bishop of Durham, who was the speaker, dwelt on the great influence of advertising on modern life, and in the cathedral the convention's slogan, "Truth in Advertising," formed the subject of the discourse. There was no harm, this speaker declared, even in advertising a particular kind of religion, so long as the advertisers were sure that it came up to the sample.

It has often been said that a good thing will "sell itself," and that advertising is more or less a superfluity; but the fallacy of this has been amply proved time and again. "A violet by a mossy stone" is a good thing, a sweet and wholesome thing, but its presence might remain unknown and the passer-by be deprived of the pleasure of its contemplation, were it not for the clustering bees who act as advertising agents and proclaim its presence to the world.

Let advertising flourish, so long as it is giving publicity to that which is good, for in so doing it will be helping to create a force which will combat that which is false, and right that which is wrong.

To Nature-Loving America

IT DOES seem a curious contradiction that a nature-loving country like America should so long remain indifferent toward one of the greatest potential sources of wealth in the land. That our people enjoy the woods and country is amply evidenced by the vastly increasing numbers who spend their hours and days of recreation in traveling into the heart of the hills and woods; evidenced, too, in the large circulation of literature and magazines dealing with wild life, such as hunting and fishing in field and stream.

How these lovers of nature can complacently view their favorite haunts ruthlessly destroyed by forest fires and the woodman's axe with never a protest is a situation difficult to comprehend or explain. Each year this occurs in all sections of the country. Our people simply crowd the more in the remaining forest places, and are unbelievably unresponsive to the call for adequate forest protection.

What a boon it would be if the great army of nature lovers would awake before too late and respond to the call of the rapidly diminishing forests. Other and older countries have long since faced and taken measures to solve this problem. How long will America remain half-hearted? When minerals, coal or oil are taken from the earth, they cannot be replaced; but it is within our power in the case of forests to "eat our cake and have it," if we act judiciously.

Doesn't it seem stupid that we should place so much emphasis on money; that we should so complacently put out our gold to earn interest, yet allow actual tangible wealth such as forests, ready and waiting to earn for us an interest far exceeding stocks, bonds or banks, to become depleted and laid waste, with only here and there feeble attempts to rescue and conserve the goose that lays the golden egg?

As Cicero would exclaim: How long, oh America, before we shall have an intelligent, concerted forestry program, backed by an enlightened public opinion?

Main Street's Contribution

THE brilliant career of Lindon Wallace Bates, the American engineer who recently died in Paris, again demonstrates that Main Street often breeds the biggest caliber men.

Born in the little town of Marshfield, Vermont, Mr. Bates became an international authority upon waterways.

He invented an improved dredge which he used with remarkable success in the Kaw and Missouri rivers about Kansas City and later in the construction of the Chicago Drainage Canal and the delta at the mouth of the Mississippi River.

However, Mr. Bates' outstanding achievement in his native country was in raising the entire city of Galveston high above its former level to prevent ocean waves during hurricanes from flooding the city.

He was frequently consulted by European governments and handled the deepening of the River Scheldt that made Antwerp a port for ocean liners. He also deepened the mouths of the Volga and Danube and constructed Black Sea ports upon them.

Subsequently, at the invitation of the Australian Government, Mr. Bates designed the Brisbane harbor improvements, and made plans for eight other ports and also extensive plans for the regulation of a number of Australian rivers.

This man's career serves to call attention to the fact that it is the engineer and not the politician who is responsible for the forward strides of the world.

Salvaging Hidden Wealth

IN THE rivers of the Lake States there lies today millions of dollars' worth of wealth in the form of pine logs which became waterlogged and sank during the drives of fifty years ago. These timbers when reclaimed from the river bottoms are virtually as good lumber as the day they were cut from the living tree. The lumber is slightly brittle but its value is reduced very little. When the drives were on in the old days the lumberjacks and rivermen worked feverishly to keep the logs together that they might take advantage of the freshet water which was stored by means of a series of log dams in all the larger rivers and their tributaries throughout the pineries of the Lake States. Logs were banked on the river during the winter and in the spring break-up they went tearing down to the mills far below on the main streams. During periods of extremely high water many of these logs became hidden from view in quiet backwaters and bayous. Becoming waterlogged they sank to the bottom where they have been preserved throughout the long years. This timber is the property of several lumber companies, many of which have gone out of existence years ago. Each log, however, bears the stamp of the company which cut it and under the law it remains that company's property. An attempt to salvage these timbers would be, in the eyes of the law, theft, unless undertaken by the owners or their heirs, many of whom have died. It has been estimated that in the Menominee River alone there is more than 100,000,000 feet of lumber worth about $25 a thousand feet today. The Muskegon, Manistee and Au Sable rivers in Michigan, the Chippewa in Wisconsin and many of the larger streams in Northern Minnesota have these golden hoards in their beds awaiting the inevitable day when the laws will permit the exploitation and utilization of their hidden treasures. In the meantime the timbers will keep indefinitely.

Will Science Dethrone Gold?

NEWSPAPER dispatches announce that a method of extracting gold from quicksilver by breaking up the quicksilver atom has been perfected by a European scientist, Professor Adolph Miethe, who is reported as affirming that he has "extracted weighable quantities" of pure gold by means of experiments.

A few years ago such a claim would have been ridiculed and the professor dismissed as a charlatan attempting to revive the old medieval quest for "the philosopher's stone." But experiments with radium in recent years have caused a widespread revision of long accepted beliefs with regard to the immutability of the so-called elements, and have brought the artificial production of gold well within the realm of possibility. It is already a demonstrated fact that lead (Pb), an element just as distinct as gold (Au), may be produced *de novo* from the decomposition of radium.

If and when gold is produced in quantity by scientific process, the economic idol known as the gold standard will speedily topple over. Already, as John Maynard Keynes declares, the gold standard is "as dead as mutton." To science may fall the honor of digging its grave.

He Is an Expert in Volcanoes and Earthquakes

Concluded from page 3

nificence which flung light, glowing pumice as much as four hundred feet into the air. Approaching close to this spectacle the men found that this burst of molten material came from a crack in the earth half a mile long. From it issued a molten, incandescent stream that spread out over the surrounding plain as far as the eye could see.

The party made camp close by this scene of weird grandeur and spent several days investigating the phenomenon. I would not imply that they heedlessly risked their lives but nevertheless it was a task the unforeseen peril of which no one could measure. Even Professor Jaggar himself who is never given to extravagant statements admitted that it was a "critical adventure."

In due time it was discovered that this mighty "spring of fire" near which the party camped was the source of a stream which flowed down the mountain side through a forest, setting fire to houses, destroying crops and finally plunging into the ocean, which it set to seething and boiling. This spectacle lasted six weeks, during which strange deep-sea fish were killed and rose to the surface, tidal waves swept high up on shore and columns of steam shot up from the sea high into the air.

Among the things noted by these scientists was the fact that the eruption of Mauna Loa was markedly different from any "performance" of Kilauea's, particularly in the frothiness of the lava and the great gas jets which indicated enormous pressure beneath the surface of the earth. But the color of the lava, the composition of the gases and what might be called the "mechanism" of the eruption was essentially the same.

As a result of his previous years of intimate study of these two volcanoes Professor Jaggar predicted that marked changes would be manifest when he returned to Kilauea. In this he was not mistaken, for on his return he found this volcano had greatly increased its flow during the early stages of Mauna Loa's eruption and then, when the underground pressure had been relieved, the lava in Halemaumau sank 400 feet in an hour and within four hours had dropped a total of 600 feet!

There are many other thrilling experiences of which I might write but perhaps enough has been cited to indicate the character of Professor Jaggar's work. Its real significance lies in the mass of scientific data which he has accumulated. Men who know what is being done at Kilauea declare that the professor's dozen years of work on the Island of Hawaii "have revealed more about the 'domestic life' and inner workings of a volcano than was learned in the previous nineteen hundred years of the Christian Era."

While the greater part of the accumulated scientific data would be no more interesting to a layman than a lawyer's library or an astronomer's calculations, the point to remember is that here for the first time in the world's history a continuous record has been kept of the rise and fall of lava, the number of earthquakes, the intensity of the tremors, the chemical composition of the lava and the escaping gases, and many other facts which constitute a foundation upon which future investigation can be based. Incidentally, these Record Books of the Observatory at Kilauea are 20-quarto volumes, supplemented by a great number of maps, special blanks, notes on special expeditions and hundreds of priceless photographs. The Record Books are typewritten and in duplicate—a wise precaution against destruction.

Above—Professor T. A. Jaggar pointing out a special feature of his especially equipped automobile, at the summit of Kilauea not far from the active crater. Below—A river of incandescent lava flowing down the side of Mauna Loa during an eruption which the scientist studied at close range.

Never before has there been such systematic experimental work in the vicinity of a volcano, with the possible exception of Vesuvius. Lava lakes have been sounded again and again and again, the work being done with steel pipes. Similarly, temperature measurements have been carried out with fusible cones and optical and electrical pyrometers. Gases have been collected with especially devised pumping apparatus and with vacuum tubes and flames have been photographed with the spectroscope for the purpose of analyzing their composition. In a very real sense this scientist and his associates have learned to know all about the moods of a volcano.

I know with what intense devotion to his chosen field Professor Jaggar conducted his study in stricken Japan. This is not his first visit to that much shaken country. Several years ago he was sent by the Hawaiian Volcano Research Association to observe conditions incident to the explosive eruptions of Sakurajima, to consult with Dr. Omori, the Japanese volcanologist, and especially to take notes on the methods of observation and prediction used by that scientist a few years ago, by reason of which a whole city full of people was moved away from the volcano in time to prevent any loss of life. One of the questions which Professor Jaggar sought to answer amid the ruins of Japan is "what warnings preceded the terrible upheaval and what facilities, if any, could have been provided by modern science accurately to record those warnings and so to have helped Japan escape its present fate."

Some three years ago in a notable address, Mr. Lorrin A. Thurston, dean of publishers in Hawaii and a director of the Hawaiian Volcano Research Association, declared that more lives and property have been destroyed in the last hundred years by earthquakes and volcanoes than by storms and shipwrecks combined, and hundreds of millions of public and private funds have been spent to predict the one and prevent the other. With hundreds of active volcanoes all over the world only Japan and the United States have devoted any sum worthy of notice to this great field of scientific study and even the United States has confined itself to use of this Hawaiian observatory which it does not own, he said.

If Mr. Thurston's words were true three years ago, how much more pointed are they today? In pity and sympathy we pour out our aid to a stricken people but we all know that we are utterly helpless to prevent another such disaster. Nevertheless, I have tried to show that among all of those who have rushed to Japan for one reason or another since it was overwhelmed by Nature in a ruthless mood. there is one man, Professor T. A. Jaggar, who believes that eventually ways will be found to predict upheavals. He has tried through years of research and toil to show mankind the path that leads to a better understanding of our changing earth. It may take a whole generation of study to enable men to learn how to predict terrestrial upheavals. But the time element is not Professor Jaggar's first concern, eager as he is for results. Rather, he is determined to lay foundations that will abide—to carry on investigations so fearlessly and thoroughly that eventually mankind will better understand the mysteries of our changing earth. Many have passed by Professor Jaggar and his work and have failed to understand its significance, but in years to come his name will stand with many another pioneer of progress. He will, indeed, be counted as one whose life was given to blaze a trail beset with hardship, danger and sacrifice that some day men would learn how to detect a coming earthquake or eruption, as they now forecast a sunny day, a destructive frost, or a terrible hurricane.

Professor T. A. Jaggar watching drilling operations on the summit of Kilauea. He is making these drills to determine sub-lava temperatures with a view to utilizing volcano heat commercially.

Stories From the Woodland Trail

Esseepan, the Coon—By D. LANGE

BRER COON is one of our four-footed kindred that has appealed to the poetic fancy of the Negroes and whose fame has been told by Uncle Remus.

Indeed anyone, who has not lost all sympathy with the humble folk in fur and feathers, cannot help feeling some admiration for Brer Coon for the way he has fought and held his own in the battle for existence.

Before the World War, some 380,000 coon skins reached the fur trade annually, which means the killing of at least 400,000 annually.

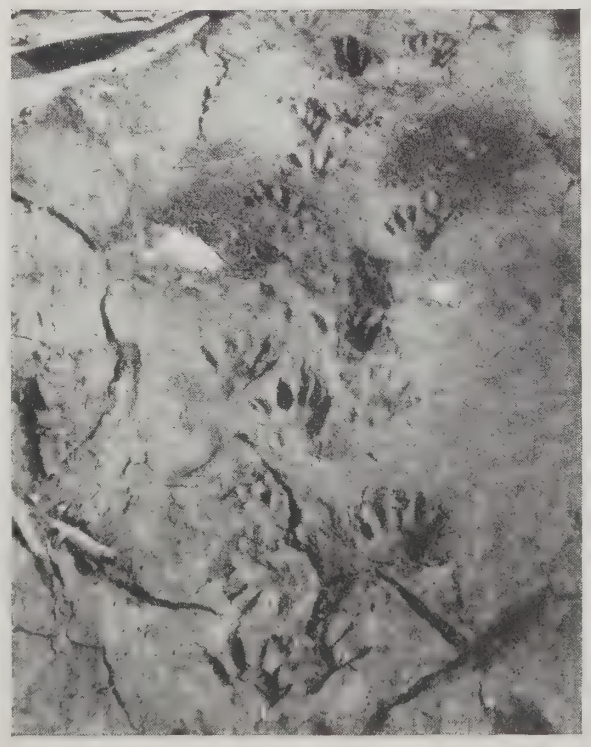
During the three years of fabulously high prices of fur immediately following the World War, the number of coon skins handled by the American fur trade reached the immense total of 1,713,700 for the years 1919 to 1921, an annual catch of 428,425. The total number of coons killed during these years of destruction must have come close to half a million a year.

An animal that can keep its hold on life in the face of such destruction deserves our admiration and protection

Indeed the time is here when all our fur-bearers must be given rational protection or the American fur trade will destroy itself.

It should be illegal to cut down a tree to catch a family of coons, and it should be illegal to drive them out by the use of fire. Hollow trees, the natural shelter for many forms of wild life, are getting scarce enough without intentional, ruthless destruction.

Fortunately the coon will make use of other shelter, if the regulation hollow tree of his ancestors cannot be found. He will accept a hollow log lying on the ground, or a crevice in a rocky cliff; in fact any kind of shelter, where he can sleep through the very cold season of winter. But Thompson Seton thinks that he will not use a hole in the ground.



Coon tracks on soft mud near a river in early spring.

The coon's favorite summer food is corn in the milk, and the species is moving northward with the spread of settlements into the northern pine regions.

Ten years ago coons were not known in the Itasca Forest at the headwaters of the Mississippi; but in the spring of 1921 a pair of them were found asleep in the hay in the manger of an unused barn at the forester's cabin of DeSoto Lake.

It is surprising how little is known of the life history of this common animal. According to Seton, it is not known when they mate, nor whether the parents ever carry food to the young. It is probable that a pair remains mated for life, but we have no absolute knowledge on this point.

In Germany the coon is called *Waschbaer,* in reference to his curious fixed habit of sousing his food in water before eating it. The coon gathers much of his food in shallow water, such as frogs, crawfish, stranded fish, and probably clams. Very likely he acquired the habit of rinsing the mud and sand off his aquatic prey before he ate it. This habit has become so fixed that a captive coon will souse a piece of meat, whether the meat needs washing or not.

Esseepan, as the Chippewa Indians call him, is not a very profound winter sleeper. In the South he is active all winter, and in this latitude his tracks may be found on the snow in March or on the mud along river banks and lake shores long before the ice has melted on the lakes.

The animals are naturally nocturnal, and are seldom seen in the daytime, and this habit has undoubtedly contributed to the preservation of the species.

Coons are still found over the larger part of the United States and Mexico, but they are dwellers of the forest and cannot live where there are no trees.

ELECTRIC BOND AND SHARE COMPANY
GENERAL ELECTRIC COMPANY

These Nine Companies, in a letter to O. C. Merrill, Executive Secretary of the Federal Power Commission, proposed that one or more of them would make an offer for Muscle Shoals. Three of them did make an offer for the group. These were the Alabama Power Co., the Tennessee Electric Power Co., and the Memphis Power & Light Co. Their offer is found in the Hull Bill, H. R. 6781, introduced Feb. 8, 1924.

* Stone and Webster corporation.
⁑ W. M. Flook, president of Tennessee Electric Power Co., was president of Memphis Gas & Electric Co., which was reorganized to form Memphis Power & Light Co., Dec. 1922.
** Controlled by Georgia Light, Power & Railways, a Massachusetts corporation.

The Power Control Menace

By RAYMOND SMITH

THE first World Power Conference ever held met in London, England, June 30 to July 12. It serves as a sharp reminder that the people of the United States are in great danger of seeing their great water power facilities become a great foreign-controlled monopoly. A small group of international financiers already has a strong hold upon the water power privileges of the United States and Canada.

One has only to study a recent report of the United States Geological Survey to visualize the enormous proportions of the prize which this monopoly seeks. The Geological Survey is authority for the statement that there goes to waste annually in the United States and Canada *water power equivalent to the burning of a half-billion tons of coal*—which is three-fourths of the amount mined in this country annually for all purposes.

Without the building of a single dam, the water now pouring down mountain sides represents sufficient power to turn nearly every wheel of industry, light and heat every American home, operate every locomotive and drive ocean liners.

It is estimated that the water power resources of the United States alone can be increased to three hundred million horse power by building huge reservoirs to hold the water during the rainy seasons.

Three billion tons of coal would be required to provide a like amount of energy.

Just what can be expected from this group of international financiers, meeting at London, is best illustrated by what has transpired in recent years. Merger after merger has been quietly effected until at this time the control exercised by the General Electric Company includes:

Seven hundred and fifty lighting companies.

One hundred and twenty street railways corporations..

One hundred and thirty-five gas corporations.

Interlocks with twenty-four other corporations that operate more than fifty public service corporations.

Minor subsidiaries that operate twelve railroads.

On the board of directors of the General Electric Company are:

Dwight W. Morrow and E. R. Stettinius who are in turn partners of Morgan, Grenfell & Company *of London.*

Seward Prosser, who is also a director of Anthony Gibbs & Company of New York, controlled by Anthony Gibbs & Sons *of London* who in turn *control Chilean Nitrates Producers Association.*

Edward C. Grenfell *of London,* a director of *the Bank of England,* is a partner of Morgan, Grenfell & Company.

In turn the General Electric Company controls the (a) Electric Bond & Share Company, which corporation, through interlocking directors, is represented upon the boards of (b) Union Carbide Company, (c) Union Carbide & Carbon Company, (d) Memphis Power & Light Company, (e) Alabama Power Company, (f) Tennessee Electric Power Company, and so forth.

The Alabama Power Company is controlled by Alabama Traction Light & Power Company, Limited, of Montreal, of which Sir Edward Mackay Edgar, *of London,* is chairman of the board of directors and also a director of Sperling & Company, the *London* bankers, and a director of the Mississippi River Power Company, of which Hugh L. Cooper, of the American Cyanamid Company is vice-president

In the *Congressional Record* of March 12, Congressman Finis J. Garrett has inserted a diagram which traces the activities of the Union Carbide Company, Associated Power Companies, E. H. Hooker, W. W. Atterbury and J. G. White step by step to the basic control of the Bank of England and Sperling & Company, bankers of London.

It is a matter of significance that there is now before the Canadian Government a bill changing the existing Water Power Act to provide that long-term leases can be made, removing from the present law the proviso that the Canadian Government can revoke any franchise at one year's notice. In urging this change representatives of the international financiers have told the Canadian Government officials that such a concession will bring unlimited capital into Canada for water power development. The undeveloped horse power of Canada is estimated at from eighteen to twenty million horse power. On January 16 of this year the Canadian General Electric Company was merged with the General Electric Company and the Canadian water rights have passed into the control of the American company.

These facts and conditions may explain the logrolling at Washington to prevent unadulterated American control of Muscle Shoals. A study of the connections of all the opponents of the American offer will quickly show foreign entanglements of a very significant order.

Golf as a Molder of Men

"Royal and Ancient" Game Supplies Elements in the Scottish Character

By VICTOR MITCHELL

THE "royal and ancient" game of golf used to be regarded as the peculiar pastime of the Scottish people, and the place it still retains in their hearts and minds may be gauged by the number of players seen on the links at all hours and in all sorts of weather. It is said that there was once a minister who, when he "foozled" the ball at a critical moment and lost the game, exclaimed in his agony, "What doth it profit a man to gain the whole world if he suffers the loss of the last hole?" Whether this story be true or not it may be taken as symbolic of the earnestness with which the average Scot enters into the game. The cold east wind may be blowing from the North Sea, the sleet may be driving across the moor or the mist descending from the hills, but the golfing enthusiast pursues his way undisturbed. In the long twilight nights of the northern summer he carries on with club and ball until the eve of the "wee, sma' oors," and when the ground is covered with snow and the visibility of the little white sphere would become absorbed in the mantle of winter, *he colors it red* and goes on with his game without interruption. There is one golf club at least in the north of Scotland which numbers among its annual events a match which starts at twelve midnight on the twenty-first of June.

Once upon a time golfing, like deer hunting, was looked upon as the almost exclusive sport of kings and princes, and princes arrayed in "plus fours" pursue the game with zest at the present day, but it is now, more than any other game in Scotland, the game of the people. There is scarcely a town or village in the country that has not its nine-hole or its eighteen-hole course, and there is no doubt that the popularity of the game is in a large measure due to the manner in which it fits in with the Scottish nature. The game requires a great deal of cool calculation; and alertness, foresight and soundness of judgment are essential to the successful player; but these are the very qualities the game itself develops.

Treading Nature's Carpet

MOST of the golf courses in Scotland, and by far the best ones, are on the seacoast, such as those of North Berwick, St. Andrews, Cruden Bay and Lossiemouth on the east, and Troon and Turnberry on the west. Along these coasts there are miles of rolling turf, smooth as velvet and firm but elastic to the tread. This turf is made up of the fine grasses which find congenial soil only by the seashore, and have grown there for countless ages. With it are mingled multitudes of mosses and minute plants which are incorporated with the verdure and woven by nature into a carpet of wonderful richness and texture. It is here the fragrant wild thyme grows; the tiny blossoms of the "craw's beans" impart the crimson and gold of the sunset, and patches of speedwell and forget-me-not, the pure azure of the sea and sky.

It is over this glowing fabric of nature's own designing that the golf player pursues his way. Those wide stretches of fragrant turf beside the sea are the links. The links are for the most part the common heritage of the Scottish people, their public recreation ground from time immemorial, and although cricket and football are played on the more level stretches of the links, golf is the game with which they are more intimately associated. Hence, strangers speak of the "golf links," but to the natives they are merely "the links." Here and there these breezy downs are dotted with clumps of golden whin and patches of purple heather, and between the golf course and the sea the yellow sand dunes gleam in the sun, and from the shelter of the long grass the skylark shoots upward to pour forth its song at heaven's gate.

One of the advantages of golf is that it is not a game which, like cricket, bowling, or baseball, confines the player to a limited field of action. He ranges over a comparatively large area and imbibes a freedom of thought and of action which no other outdoor form of recreation is capable of giving. His energies are not cribbed, cabined or confined by boundary fences or chalk lines, and it may be that he almost unconsciously traverses several miles in making the round of the course.

Advancing to the first tee he drives off his ball with that swinging motion which brings almost every muscle of the body into play, and with a keen and calculating eye follows its course until, if he is fortunate, it alights on the greensward in the open, or sinks out of sight in the "rough." Perhaps the sphere may find a lodgment in one of the hazards—a sand bunker or a meandering stream—and it is in such a contingency that the player is called upon to exercise the virtue of patience in a manifold degree. His keenness of vision is also put to the test, and even when he finds the ball after an exhaustive search, it requires no end of judgment and skill to play it out of this awkward "lie." At length, with two or three well-calculated shots, the ball lands on the putting green within what seems easy distance of the hole which is its goal for the time being. But here again the player is called upon to supplement his skill in the use of the putter by the exercise of the virtues of forbearance and self-restraint. Over-confidence may cause him to strike the ball a little too sharply, with the result that it shoots past the desired goal without going in, or through timidity or a lack of decision his "putt" may be weak, and the globule of gutta-percha, after a feeble effort to reach its destination, comes to a dead stop a few inches therefrom, just sufficient for the player to lose the game. He who has attained sufficient mastery over himself to take this disappointment philosophically, and to take comfort to himself in the reflection that he may do better next time, has attained something that after all is of far greater value than the mere satisfaction of having won.

To the casual onlooker the game of golf appears somewhat monotonous, but it really has more variety than almost any other form of outdoor diversion. At the beginning of the round it is impossible even for the most experienced players to foretell how the game is likely to turn out or what unforeseen adventures may be met with before the round of the course is completed, and it is this glorious uncertainty that constitutes one of the charms of golf. The champion of today may have his laurels wrested from him by the obscure player of tomorrow. It is a game in which the race is not always to the swift nor the victory to the strong. No, there is nothing monotonous about golf. Apart from the hazards and unexpected happenings that await the player, he enters into a new world at almost every stage of the game, and gathers courage as he proceeds.

The Lure of the Uncertain

IT IS perhaps this element of uncertainty, and the obligation that is put upon the player of looking upon the game from every conceivable angle, that endow it with such a fascination. "Oh, but after all, it is only an old man's game," says the gay young fellow who loves the excitement of "rugger" or baseball; but the most eminent sportsmen, backed up by the medical faculty, deny this, and the thousands of our young and virile manhood who keenly enjoy a round of the golf course and derive benefit therefrom abundantly disprove it.

The breezy environment of the golf course not only delights the eye but braces the mind and brings out all that is best in a man—self-reliance, prudence, patience and perseverance: in a word, it provides the key to success both corporeal and spiritual, a healthy mind in a healthy body. There may not be the hectic excitement in a game of golf that some demand in outdoor sports, but it carries a man much further than some of the more violent forms of exercise. As a matter of fact, golf, instead of being an old man's game, is every man's game; it is the game of old and young alike, of rich and poor, of male and female. In Scotland it is essentially a democratic game, a game where class distinctions are forgotten or lost, where the players are all "John Tamson's bairns."

It has been found that in the interests of public health there is no better auxiliary than the game of golf, for it takes the people out of the crowded city to the pure air of the seaside or the country and provides them with a form of exercise that cannot be surpassed. Not only is it good for the body; but it is a builder of character, for it has a steadying influence that the more strenuous and exciting games do not possess. It also has the unique distinction of being a game in which those interested are not divided into two very unequal portions—players and spectators—but in which, except in the case of exhibition matches, all are players. Outdoor sport, if it is to become a real national asset, should not consist of ten thousand people sitting in cramped-up positions watching nine men handling a bat and a ball, but ought to be of such a nature as to allow the thousands themselves to become participants. A large proportion of our so-called sportsmen are mere shouters and noisemakers, and have no more claim to be regarded as exponents of any particular game than the Roman mob which attended the gladiatorial contests in the arena.

Always Looking Forward

IT IS generally conceded that sport and outdoor exercises of all kinds are builders of character, but none of them possesses the facilities for imparting such benefits to the community as a whole as does the game of golf. The social aspect of the game—not to mention its family aspect—is also more pronounced than in any other form of recreation. It is a game which in Scotland belongs to no particular class and is the especial privilege of none. This is as it ought to be; this is why golf ought to make, and is making, an especial appeal to freedom-loving America. It is a game which ought to be encouraged by every municipality in the country. It is a splendid investment for any city to provide a recreation ground of this kind for the people and to encourage them to play on it. Golf calls for no violent exertion on the part of the player, but it leads him into the open air and sunshine amid the scenes of nature, and furnishes just what is required in the shape of a tonic for mind and body. A community playing golf in its leisure moments should have no time for less edifying pursuits.

For the artisan who seeks for healthy recreation after a day, or night, in a busy factory, the game of golf is ideal, because it does not unduly fatigue the body like some more strenuous pastimes, and it has the advantage over bowling that it provides variety. Golf may be compared to a ramble in the country in which the joys of nature are unfolded in all their charm; in which there is a well-nigh perfect form of training both for the mind and body with just enough excitement in it to make it interesting, and just enough skill required to call forth the faculty of alertness, and the virtues of patience, forbearance, and good-fellowship. It has also been shown that the characteristics of foresight and perseverance are likewise developed. The golfer never looks backward; "Fore" is his slogan, and his aim is to drive his ball clear of all traps and pitfalls, just as a pilot navigates his ship to the desired haven by the shortest and safest course. To sum up, the game of golf and the game of life have very much in common.

Alcohol in History

FROM the earliest ages alcohol has taken a prominent place in the history of the world, and from time to time its use or abuse has become a problem. This is fully demonstrated in an article by William Little which appears in the *English Review* for June. The part that alcohol has played in the lives of nations from the time of the Deluge to the present day is most marked. It was the cause of Noah's terrible curse on Canaan, it figures in the destruction of the family of Job, and it was the direct cause of the overthrow of Babylon, as it was of nations and peoples for centuries after.

Wine was used in Egypt from the remotest ages, and two wine jars have been found in the tomb of Tutankhamen. In other Egyptian discoveries the processes of viticulture and vinification are depicted by carvings executed probably a century before the time of Joseph.

Such was the overindulgence in alcohol at certain periods of history that prohibition laws had to be passed to avert disaster. For example, Lycurgus, King of Thrace, found it necessary to pass a prohibition act long before the Christian Era to check the tide of drinking that was threatening to destroy his people. Not content with merely forbidding the consumption of wine, he caused all the grapevines in his kingdom to be torn up by the roots.

Some modern nations would do well to take a lesson from this drastic measure of the Grecian king, for, while discouraging or prohibiting the consumption of liquor, they permit its manufacture and distribution, under certain conditions, to go on unrestrained. Lycurgus literally went to the root of the matter.

The greatest weapon that Mahomet possessed in carrying on his propaganda was that of prohibition. He succeeded in putting a veto on all alcoholic drinks, and immediately his followers began to prove their strength against all opposing nations. If it had not been for the degeneracy caused in the Byzantine Empire by overindulgence in wine, the Turks would never have conquered Constantinople and gained a permanent foothold in Europe.

For nations that ignore the insidious effects of traffic in liquor, the handwriting on the wall which foretold to Belshazzar the destruction of his kingdom is not far to seek. While the Babylonian revels were at their height, Cyrus with his Medes and Persians was advancing on the doomed city.

One has only to examine the pages of history to see what a tremendous part the vice of drinking played in the downfall of nations. In its train has followed first the ruin of the individual, then the destruction of the community, and finally the collapse of the nation. If history is to be of any value, its lessons must be learned and learned well.

Famous Marriages at Gretna Green

THERE was recently sold at auction in London about a thousand certificates of marriages which were celebrated at Gretna Green in Scotland by John Linton, the famous border "priest," who used a blacksmith's anvil for an altar. Among John Linton's clients were numbered members of the highest families in the land. As a training for such a romantic way of earning his livelihood he had acted as valet and confidential servant to Sir James Graham, of Netherby Hall, rendered famous by the exploit of "Young Lochinvar."

Among the border marriages celebrated by Linton was that of Prince Charles Ferdinand Bourbon, brother of Ferdinand II of Sicily, and Miss Penelope Smith, a Devonshire heiress. In the course of an interesting article in the Glasgow *Weekly Herald*, by K. Patrick Fleming, it is related that Miss Smith, who was famed for her beauty and possessed of considerable wealth, was traveling abroad when she met the royal lover. As soon as the Sicilian royal family discovered the affection of the prince for the English girl they set about putting every possible obstacle in the way. The prince, however, renounced his rights to the succession and vowed to marry Penelope at all costs. At Rome they went through the ceremony of marriage, but this was nullified by a royal edict. They were again thwarted after a celebration at Madrid.

In spite of Sicilian intervention, a marriage was celebrated at St. George's, Hanover Square, London; but in the end this also was declared void, not having the sanction of the King of Sicily. It was then, in 1836, that the pair discovered the laws of the church and of foreign potentates were nothing to the power of the blacksmith "priest" at Gretna Green, and there they were united.

Even more romantic than the royal match was the marriage of Edward Gibbon Wakefield, scoundrel and empire-builder, and Ellen Turner, sixteen-year-old daughter of a Cheshire gentleman. She was then finishing her education at a boarding school and had expectations of a considerable fortune. Wakefield at this time was thirty and had already buried one wife whom he had clandestinely married. Now he determined to woo Ellen Turner, although the girl had never seen him.

One day he presented himself to the headmistress of the school, saying that he had been sent by Mr. Turner to break some bad news to Ellen, and to take her home at once.

To Ellen he said that her father's wealth had gone, and that complete social and financial failure could be averted only by the girl's consenting to marry him. He suggested Gretna Green as the speediest method of union, and the girl at last consented. They were accordingly married, although Linton did not officiate, his assistant, a man named Lang, acting in his absence.

Wakefield was prepared for an outburst of parental wrath, but expected that when it died down they would be received with open arms. So he took his bride to France to await peace. But instead of a paternal blessing and reconciliation, he received a sentence of three years' imprisonment at Lancaster assizes for abduction. In spite of the crime, so firmly tied were Wakefield and his girl-bride that a special Act of Parliament had to be passed to annul the marriage.

The Rescue of the Greely Expedition

Brave Men Battle With Arctic Terrors to Reach Starving Explorers

By BURT M. McCONNELL

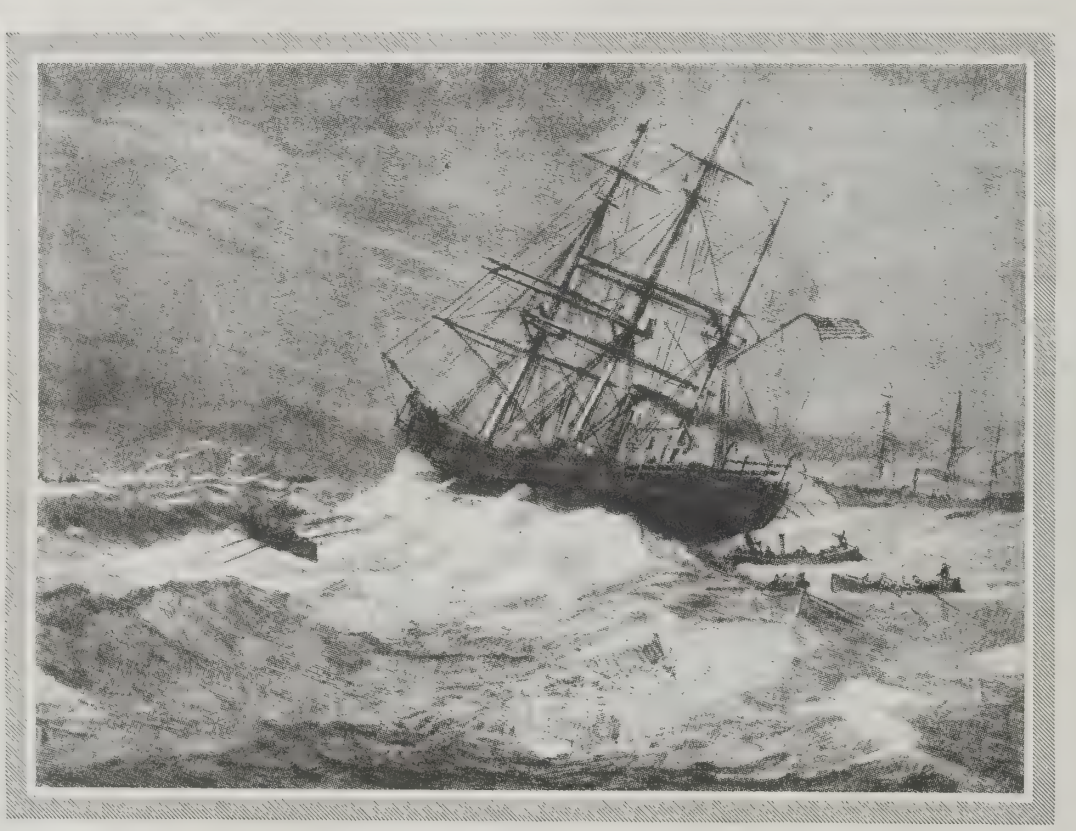
Meteorologist, Canadian Arctic Expedition, 1914.

THE midnight sun, a dull red ball of fire, looked down upon a squalid, flapping tent on the eastern coast of Grinnell Land. In it were lying the seven weak and emaciated survivors of the Greely expedition. Seven out of twenty-five! All of them were momentarily expecting death, but one in particular was a little nearer the Grim Reaper than the others; besides suffering from starvation and scurvy, he had lost both hands and feet from frostbites. And while there was precious little food to be conveyed to his mouth, his thoughtful companions had fastened a fork to one arm and a spoon to the other. Greely and his men, in a land of little game, with almost no food, were too exhausted to launch a boat when open water appeared between Grinnell Land and Greenland, and unable to retreat over the drifting ice fields because of open water and strong tides. The entire party appeared to be doomed.

They had penetrated this Arctic waste in the summer of 1881, and it was now June 22, 1884—forty years ago. Each year an expedition had been sent to rescue them, but without success.

After the return of the 1882 and 1883 relief expeditions, an indignant American people forced Congress to offer a reward of $25,000 for the first information of the Greely party, and to send out a third relief expedition of two government vessels, the *Thetis* and the *Bear*.

As these two vessels, with two whaling ships, fought their way through the ice-infested waters of Baffin's Bay, sometimes by the aid of torpedoes, the few enfeebled survivors of the Greely expedition lay in their dilapidated tent at Fort Conger, quietly awaiting death. This struggle, with the likelihood of being crushed by the ice always present, lasted three weeks. Sometimes the staunch vessels, when sent full speed into an ice floe, would slide clamberingly upon it, like a polar bear struggling up out of the water, and break it down with their sheer weight. For the honor of the United States Navy was at stake!



The rescue of the survivors of the Greely expedition.

High up on the foremast of each vessel, a hundred and ten feet above the water's edge, the lookout, standing in his barrel or "crow's nest," hour after hour, day after day, guided the ship through the ice fields, meanwhile anxiously scanning the shore for any trace of life. On deck a sledge, loaded with provisions and a first-aid kit, and a team of eager dogs were kept in readiness for a dash ashore over the ice. A launch, similarly equipped with rations and water, swung from the davits.

In addition to such perils as tides, currents, and drifting ice fields, a gale now threatened. The government ships were now headed toward Cape Sabine—to escape the gale and to look for traces of the Greely survivors. The whalers went their own way

Nearing Cape Sabine, a launch was dispatched from the *Bear*. Soon the crew discovered a tent, bellying and flapping in the fierce gusts, and partly blown down. But there was no sign of life. Then a pitiable object, which they soon realized was one of the survivors, raised a signal flag—of red and white underwear and blue bunting.

The relief party hurried ashore, where an appalling sight met their gaze. A row of more than a dozen graves lay along the top of a gravel knoll. Stretched out upon a snowdrift was one of the dead. Protruding from a shallow grave, the brass buttons of an officer's uniform shone like nuggets of gold in the early morning light.

Ripping open the tent with their knives, the rescuers found Greely and the others lying on the ground in their sleeping bags, their pinched and cadaverous faces, sunken eyes, scraggly beards and matted hair making a picture never to be forgotten. One of them was "dead to the waist"; all feeling had left him. None of the party had washed for nearly a year. All of them were so weak that they could barely swallow the hot milk and beef tea brought by the rescuers. They had been on a starvation diet for months; for the previous two days nothing in the way of "nourishment" except a few bits of sealskin had passed their lips.

The seven survivors were quickly brought out into the open and carefully wrapped in blankets. By this time the gale had increased to a hurricane. But the work of rescue went on. The bodies on the hill were disinterred, marked for identification, and taken aboard the ships, where they were placed on deck, each wrapped in an American flag. The survivors, their forms wasted to mere shadows, then were carried down to the water's edge on stretchers and rowed out to the ships, with water dashing over the bows at every lunge. Such was the dramatic rescue of the Greely survivors on June 22, 1884—forty years ago. The youthful commanding officer, now Major General Greely, retired, and his right-hand man, Sergeant Brainard, now Brigadier General Brainard, the two sole survivors at this late date, agree that if the rescuers had arrived forty-eight hours later they would have found nothing but corpses at Cape Sabine.

The Greely expedition, imbued with the spirit of exploration which has fascinated adventurers since the beginning of time, started out auspiciously enough. The twenty-four young men, who, in the interests of science voluntarily cut themselves off from civilization, were American soldiers. Their commander, Lieutenant Greely, had risen from the ranks. To officers and men alike Arctic exploration was as fascinating, and the call of the polar regions as alluring as it was in the ninth century when Eric the Red, in his travels into the frigid North, discovered Greenland. They knew that hundreds of Arctic adventurers had lost their lives since man first tried to find a northwest passage to China, yet that did not deter them.

They soon learned, as they plunged into the great unknown to fight a war against scurvy, starvation and the elements, that the Arctic was no place for weaklings. Much has been written of the heroism of the soldier who heedlessly flings himself into battle, the tumult of war, the beat of drums, and martial music urging him to victory or death; but what courage could be higher, what heroism more exalted, than that evinced by Greely's men? In the face of almost certain death by starvation; in spite of their absolute helplessness and the abortive plans of our government to rescue them, Greely and his men displayed a degree of fortitude and strength of character that will live in history.

The unparalleled disaster which overtook the expedition was in no way a reflection on its commander, who with two brother Army officers, twenty-two enlisted men, and two Greenland Eskimos eventually accomplished what he had set out to do. He gave to science a complete set of astronomical, meteorological, and other observations that has never been duplicated; his followers traversed an unknown shore hundreds of miles to the northward, and reached the "farthest north" ever attained up to that time. That the lives of most of them were sacrificed to exploration is due to the failure of other missions—the relief ships which never came. To quote Greely's own opinion:

> "The relief expeditions managed from Washington were ghastly failures. That nineteen out of twenty-five men perished was due to the incompetency and to the desertion of the commands—both military and naval."

This is one of the few blots on our Army and Navy records.

In August, 1881, the *Proteus*, a small vessel chartered by our government, carried the Greely party of twenty-five, with two Eskimo hunters, to Lady Franklin Bay on the east coast of Grinnell Land. This vessel was to have brought them back to the United States the following year. Here, on the shore of a sheltered cove where there was coal in abundance, they constructed comfortable quarters, and with the aid of the Eskimo hunters killed enough musk oxen to provide them with meat throughout the winter. Food depots were established for the sustenance of advance sledging parties the following spring.

During the first half of the winter small parties were sent out in various directions, mainly to prepare them for an attempt to exceed the "farthest north" record.

The men dragged their own sledges. At night they found their sleeping bags stiffened with frost. Their outer clothing and footgear upon being removed would freeze within five minutes. It was necessary to thaw out their sleeping bags by the scant warmth of their own bodies. In the morning they endured the same routine, thawing out frozen clothing and shoes. Lunch was found to be impracticable because its preparation took too long, and there were no thermos bottles in those days.

Early in the spring Lieutenant Lockwood and Sergeant Brainard, with a small party, set out on the hazardous attempt to reach the "farthest north." With dogs and sledges, they plodded along the trackless coast of Grinnell Land, crossed over the ice to Greenland, and continued northward along its western coast. Difficulties beset them at every turn. At one stage of the trip a raging blizzard kept them in their sleeping bags for some forty-eight hours. The wind blew so violently that men at headquarters were actually carried off their feet at times. Snow blindness and the breaking of a sledge added further to the trials of the Lockwood party. They struggled ahead, however, and when they were not halted by storms traveled about twenty miles daily. The reward of their courage and endurance was the attainment of the highest latitude ever reached by man—83°23′ N.—where the Stars and Stripes were triumphantly hoisted. After sixty days' absence, during which time they traveled more than a thousand miles in all sorts of weather, they returned to the winter base.

With the coming of spring and the breaking up of the ice fields between Grinnell Land and Greenland, the men scanned the horizon long and earnestly for a relief ship, but neither a sail nor a smudge of smoke was seen that year. Lieutenant Greely's instructions, in case no vessels reached him that summer, were to abandon his station—which he had named Fort Conger—not later than September 1 of the following year and retreat southward by boat, skirting the east coast of Grinnell Land. Meanwhile, however, the party must solve the immediate problem of getting through the intervening winter.

By the end of July everything was in readiness for departure. The party carried over forty days' full rations, and Greely had cached during the previous winter, at a point to the southward, rations for more than twenty days.

Time passed and still the ice did not open. On August 8, the date set, a heavy snowstorm came. The following day, however, the entire party (except the dogs, which were abandoned), distributed in a 27-foot navy launch, one whaleboat, and a couple of smaller boats, worked their way out into the strait through scattered ice fields, in imminent danger of being crushed to atoms. For two weeks they toiled through the drifting floes. By alternately fighting their way along the coast and drifting with the ice packs for some three hundred miles, they managed to reach late in August a point within fifty miles of Cape Sabine. At this juncture, with open water only a mile away, the party was beset; frozen in. The position was a precarious one; they did not know at what moment the ice might crumble beneath their feet and the sea swallow them up. Their provisions were dwindling rapidly.

Finally, on September 10, the travelers started ashore over the rough ice, dragging two of the boats and some twenty-three hundred pounds of food, clothing, and equipment. Struggling with this burden, they found after six hours of toil that they had progressed only a mile and a quarter. At night some of them slept upon the ice and others in the boats. The short dark days of winter were fast approaching, and numerous snowstorms delayed them. A violent northwest gale carried the ice on which they were camped out to sea. But after four hundred miles of travel by boat and a hundred miles by both sled and boat, occupying in all fifty-one days, Greely landed his party at Eskimo Point, near Cape Sabine.

Greely now decided it would be impracticable to attempt a retreat to Greenland, where there were Eskimos, food, and shelter; their recent experience had proved that they could not average more than two miles a day across a moving ice field. It was therefore impossible to cross the twenty-five-mile channel when, for every two miles traveled east, they would drift four miles to the south. Then there was much rubble and slush ice in the drifting pack, making travel dangerous if not foolhardy; the tides were strong, rising and falling from ten to twelve feet every six hours and twisting the ice pack in all directions. New ice was constantly forming, but while this was strong enough to impede the passage of the party's boats, it was not thick enough to bear the weight of either boat or man. A retreat to Greenland, therefore, was out of the question.

Winter quarters were then established at Cape Sabine, where Greely hoped they could kill walrus and seal, and perhaps polar bears. Their quarters were constructed of stone and snow, with the old whaleboat for a roof, and here in this dingy hut, about twenty by thirty feet, were crowded the twenty-seven men with their sleeping bags, clothing and equipment. They had no stove, and their light, used upon rare occasions only, was a seal blubber lamp with a bit of rag for a wick. Starvation, however, gradually manifested itself. Some of the men grew delirious with hunger. Greely, by this time, was worn by mental anxiety and responsibility. There were several petty thefts of food; the men grew quarrelsome; the surgeon was insubordinate. But these incidents, when compared with the courage and acts of heroism of most of the members of the party, of which more will be told, were scarce worthy of mention.

It was now the first of November. By putting his men on one-fourth rations, Greely estimated that the provisions furnished by two caches would supply the party with food until March 1, when the men might be able to cross Smith Sound to Greenland by sledge. They brought in the other whaleboat and cut it up for fuel, although fuel could be used for cooking purposes only; it was too precious to use for heating the hut, which remained cold, damp and uncomfortable. The disappearance of the sun added to their discomfort and depression. The hunters went out daily for game, but found little.

In this desperate situation Greely decided to send a few volunteers forty miles to the southward to bring back one hundred and forty-four pounds of meat which had been cached there by an English expedition seven years before. Four of the stronger men—Rice, Elison, Frederick, and Lynn—were selected. After four days' exhausting traveling through rough ice and snow, they reached the cache, and packed the meat on their sledges. They had left their sleeping bags at a spot near the shore, fully expecting to return to them that night, but it required fourteen hours for the wearied men to reach the cache, load the meat on the sledge and return to their sleeping bags. On this difficult journey, Elison froze both his hands and feet. By placing his benumbed extremities next their own bodies, his companions were able to draw out the frost, but Elison was absolutely helpless the next morning. To save his life it became necessary to abandon the meat. A ten-hour struggle, encumbered with their helpless burden, brought them to an abandoned hut. Here they cut up the English boat for firewood. Elison's suffering, once his face, hands and feet commenced to thaw from the artificial heat, can better be imagined than described. The following day Elison had to make his way as best he could, led by a rope attached to the sledge. Hour after hour, a pitiable figure, he stumbled along. Finally when his feet were so numb that he could no longer stand, the party camped, and Rice bravely set forth alone in the face of a northwest gale to get help from their winter camp. This solitary journey of fifteen miles was made in absolute darkness across the newly formed ice, but he kept boldly on his way, heedless of danger, and at midnight staggered into camp and told with stiffening lips of the plight of his three companions.

Though they had been on reduced rations for months and were weak and half-starving, a small band of volunteers immediately set forth into the blizzard, risking their lives to go to the aid of a comrade whom they fully expected to find dead. The journey of the half-starved relief party was one of the most remarkable in Arctic history. They traveled forty miles in forty-four hours, most of the time in total darkness over very rough and heavy ice.

(C) Ewing Galloway, N.Y.

Above—Queen Mountain, in the center of King Jacob's Land, Arctic, taken from 4,000 feet altitude on the Hammer-Junker aerial expedition organized to aid the Amundsen projected Polar dash. The Junker commercial plane from which this was taken made non-stop flights in the Arctic up to 700 miles, proving—according to the chief, Haakon Hammer, who has just arrived in the U.S.—that a flight to the Pole could be made with ease. Below—Wall of the Great Glacier, Bell Sound, Norway.

By the middle of November, nearly half of the party were unfit for duty by reason of frostbite or injuries received during their laborious autumn work. The roof and walls of the hut gathered frost and ice, as did every other article in the wretched place. Their sleeping bags and clothing froze to the ground. They were on rations declared by the surgeon to be insufficient to sustain life. They cut wood into pieces not much longer than matches to insure perfect combustion, and used it only for cooking. Except the hunters, the men remained from necessity or choice almost continually in their sleeping bags.

The Christmas menu of the party consisted of a stew made of seal blubber, preserved potatoes and bread, and flavored with pickled onions. For "dessert" they had a sort of rice pudding with raisins, seal blubber, and condensed milk.

Then came the New Year—and with it disaster. Cross, who had developed marked signs of scurvy, was released from his suffering. The funeral ceremony was a pathetic one. The men dug a shallow grave as best they could in the frozen soil, and tenderly laid in it the first victim of the dread disease of the Arctic. He was covered with the American flag. A salute was to have been fired, but Greely decided that their scanty supply of ammunition must be conserved.

Their one hope now lay in reaching Littleton Island, where some believed an American relief ship might have laid down stores for them. Early in February Rice and one of the Eskimos, who were stronger than the others, left for this bit of rock. But a day later they returned reporting open water to the northward as far as the eye could see.

By the first of March, when Greely had intended to cross on the ice to Greenland, the strait was wide open. At that time it would have been possible to cross in the open boats to Greenland, but the party did not have sufficient strength to remove the boat from the building and carry it down to the open water. Three weeks later everyone realized that the beginning of the end was at hand. They had long since given up hope of rescue, and were huddled together in damp and unsanitary quarters. In their enfeebled condition they could barely crawl around the camp, or attempt to catch shrimp or seaweed.

Starvation claimed Christiansen, an Eskimo hunter, and Lynn. The fates seemed to be against them.

Fort Conger, Grinnell Land, May 20, 1883.

Rice and Frederick now set out to find the cache of English beef which had been abandoned by them the previous November. During the first part of the journey they encountered a terrific gale. Without food or drink of any kind, exhausted and ill, they crawled into their sleeping bag. The drifting snow soon covered them, and they were held prisoners for almost twenty-four hours. When at last they freed themselves they were nearly frozen. After a warm meal they continued toward the point where the meat had been cached. There disappointment awaited them. Though they searched every foot of ice, not a trace was to be found.

Stunned by the realization that their struggle had been in vain, they started homeward, but Rice, who had been getting gradually weaker, soon found he could go no farther. Later in the day he suffered a hemorrhage, and died within a few minutes.

Starved for months, weakened by his severe and exhausting labors, chilled to numbness, alone on an extended ice field, Frederick felt that he could not go on. But he knew if he failed to return to the camp some of his companions, at the risk of their own lives, would venture out in search of him. So, summoning up every ounce of his waning strength, Frederick stumbled along for miles until he reached his sleeping bag. Here, weary and disheartened, he rested. Next morning, after having a little food and drink, Frederick went back to the spot where his dead companion lay and buried him in the snow. Trudging another six miles back to his sleeping bag, he loaded his belongings on the sledge and started for the hut. Dragging his sledge as far as his enfeebled condition would permit, he would take a little food, get into his sleeping bag, and sleep for a short time. In this way he managed to return to the hut.

Portrait of A. W. Greely.

Death was by this time a frequent visitor. Lieutenant Lockwood and others, including the doctor, passed away in May and June, and the remaining Eskimo hunter was drowned in an attempt to get food. It was necessary to have one man shot for his repeated and brazen thefts from their scanty store of provisions. (The Secretary of War wrote Greely after the return of the expedition saying that he entertained no doubt of the necessity and the entire propriety of this action in ordering the execution of this soldier under the circumstances.) Greely was sick and weak and the few of his men who had not already been laid in their last resting places, were feeble and wretched.

June opened with a howling gale and driving snow. For a day and a half the party had had nothing whatever to eat. Everybody was quite miserable, not only from lack of food, but from the cold, to which in their enfeebled condition they were very sensitive. Millions of ducks and geese flew past, but the hunters were unable to obtain any. By the twenty-first there were but seven men left of the twenty-five; and they calmly faced the inevitable. For almost two days nothing in the way of nutriment except a few bits of sealskin had passed their lips. The end of all was approaching. But help was speeding to them in their extremity in the person of Captain (later Rear Admiral) Schley. The long agony of waiting was over. Tenderly they were cared for and nursed back to health on board the *Thetis* and *Bear*. But it was too late to save poor Elison, who, sick and maimed since that first year in the Arctic, lived only long enough to reach the first Greenland port on the way home.

And so the tragedy of Cape Sabine went down into history, and nineteen more lives were added to the seven hundred or more that have been sacrificed in Arctic wastes. Their arduous labors, heroic endurance, and unflinching determination had advanced the American flag to an unparalleled latitude on both land and sea. The expedition had carried out the scientific program allotted to it; it had increased the world's knowledge of the physical characteristics of Grinnell Land. What is more remarkable, its members, in one of the most extraordinary and successful boat journeys of the age, had brought their records to a safe place at the price of great bodily suffering, through a dense polar ice pack, and to a point where they would eventually reach the world.

The victims of scurvy and starvation died in the interests of science, and this should not be forgotten. The blame for their loss rests, not upon Greely, but upon the commanders of American rescue vessels, who failed to rescue Greely and his men and to lay down food depots along the coast sufficient to sustain them until a vessel could force its way through the pack to either Cape Sabine or Fort Conger.

Through the long winter nights the aurora borealis blazons its challenge across the Arctic sky; but its beckoning lure no longer calls to the heroes who are sleeping their last long sleep in that icy waste. No poppies bloom above their heads; their names are not engraved upon tablets of bronze. But at that "farthest north," in solitary defiance to the elements, the remnants of an American flag may still flutter in the wind—an everlasting memorial to the men who died in its service.

Let Trees Play Godmother to America's Towns

Inspiration Comes to Many a Community From the Forest It Owns

By FRANZ A. AUST and HAZEL HANKINSON

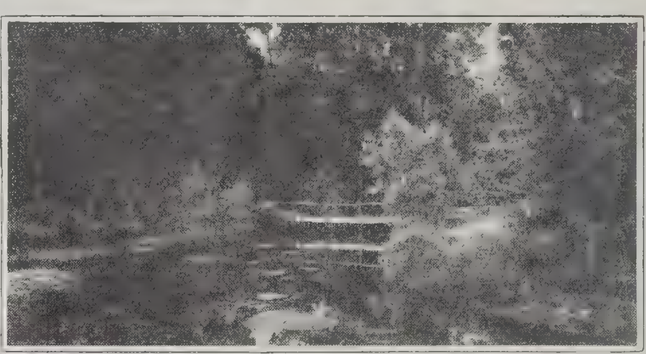
A FOREST of trees may indeed prove to be a community's fairy godmother!

Rightly managed, a forest owned by town, village or city can help to protect the community's health, as well as its general welfare. It can enter into its social, recreational, and workaday life. And last, but by no means least, such a woodland can be made to furnish "trunks filled with gold" to the community of which it is the valuable possession! In short, it has been known to pay the taxes! What more can one ask of a godmother?

Sounds like a tale of sprites and wood nymphs, doesn't it? It's a spicy thought, at least, when viewed from the standpoint of mere variety. For what man and what town have not been repeatedly directed and instructed and warned and entreated to watch over and to care for the trees of America? And rightly so. America's trees in woodland and forest and on roadway and street must be guarded, that their days of shade and beauty and value may be long in the land. America's future generations must not be allowed to go unsatisfied when they long wistfully for something to "whittle." But meanwhile it's pleasant to learn that trees can "take care of" many a city and village and town.

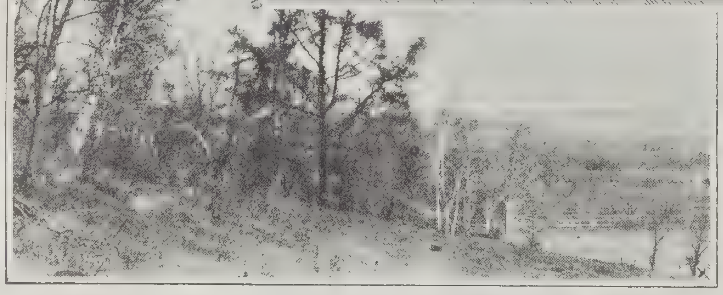
As a splendid example of what is actually being done, take the state of New York. Always one of the nation's important tree-growing sections, this state has more forests that are the property of cities and towns than any other state in the Union. More than 170 000 acres of forest land are owned by communities in New York. Troy possesses the most, for this city has 57,000 acres of trees; New York City is second with 48,450, and Rochester comes third with 39,863 acres. These woodlands are controlled according to the laws of each community. Johnstown, Syracuse, Utica, Saratoga Springs and many other well-known places also own community standing forests.

Then there are the lands newly planted to trees and owned in the same way by communities. New York City herself leads all the others in this, for she has 19,000 acres owned and reforested. She has been one of the pioneers in America in buying land for this purpose. And other smaller cities, too, have done remarkably well. Gloversville, a place of about 22 000, has 1 500 acres of reforested land, and Rochester, third on the list, owns 915 acres of trees which she has planted.



Rustic bridge.

A wonderful nurse crop for future second growth of timber which in time will be furnishing "trunks of gold" to the community possessing it.



Steep barren hillsides, tree-covered, prevent erosion and keep sediment from a community's water supply.

Now the communities of the state of New York have a number of reasons for these tree activities which bring the attention of citizens to such a broad co-operative owning and planting. Chief among these is the reforesting of watersheds that reservoirs and other sources of water supply may be kept intact. Syracuse, for instance, by means of her municipal forest, insures sanitary conditions to the city and thus a clean and pure water supply. Rochester not only accomplishes the same purpose, but plants the unsightly waste places on the outskirts of the city with the aim of developing them into beautiful forest parks for her citizens to enjoy. And for this she has already gained an admirable reputation. Then, in all the forests, city-owned, as the trees come to their maturity, much timber can be wisely cut and sold from time to time to fill the municipal coffers.

Outside the state of New York, Atlanta, Georgia, is one of the cities which is recently taking steps to reforest land which she owns outside the city limits. Many acres of trees will not only beautify the approaches to the city but will benefit the citizens in other ways, as those of the New York communities are doing.

Many a community, especially along river valleys in these days since natural forests have become the exception and not the rule, is vitally concerned with floods which descend from treeless mountains and hills. Within the last few years, the whole nation has suffered great loss of life and property on this account. Many thousands of dollars every year are lost by floods in the Missouri and Ohio valleys alone because of the treeless uplands. And the building of dikes and levees has not been sufficient safeguard.

There are scores of towns and villages of the smaller type in the United States situated on flat outwash plains with hills in the background. Where these hills are laid bare of trees, thawing takes place more rapidly in spring than where the space is covered with woodland. Sometimes whole sections are flooded; often the thawing, which goes on rapidly on hillsides where there are no trees, places a heavy strain on storm and drainage sewers with additional heavy expense to the community.

On the other hand, community woodlands on the hillsides bordering towns like this in a few years take care of the matter in an excellent way. Thawing takes place slowly in spring so that floods cannot have their way; heavy strains are not felt on storm and drainage sewers. Meanwhile, the surplus moisture is gradually thawing and seeping into the soil to benefit the farming land for miles around.

Land bought by a community for reforesting will naturally be non-agricultural land. Swamp ground may sometimes be cheaply purchased. Steep barren hillsides are seldom fertile for crops of any kind except trees and can often be bought for that purpose from private owners who are glad to sell. Massachusetts even goes so far as to define a town forest as a "permanent, self-supporting, valuable *gift* to a town or city." And some community-owned woodlands in that state, it is reported, have been secured in that way. Such a gift is indeed a worthy means by which a man may establish a lasting memorial to himself.

The state of California secures protection for the water power of cities and towns through the protection of national forests and other woodlands in the state. Los Angeles brings its city water 180 miles from the mountains where great trees cover the sides. For there is no doubt that in most cases the presence of trees clarifies and makes fit for use the water which is furnished to a water supply or power system, for the reservoirs are thus kept free from sediment.

On the other hand, in treeless areas where erosion takes place, many important power sites have been made worthless because of the large amounts of sediment taken into the streams feeding the reservoirs. A power reservoir in the southern part of the Appalachian region, for instance, to begin with, had a depth of twenty-eight feet, but within two years a large island had completely filled the center. Another large reservoir became three-quarters filled with sediment within four years from the time it was built. Not only do such occurrences cause great expense to communities or power companies; they are likely to bring about flood damage when storage capacity of reservoirs has been thus diminished.

Certain eastern foresters who have had fine experience among city-owned forests extending over ten years or more of time suggest that an unusually splendid opportunity awaits small towns and even rural communities for keeping up and reforesting their own woodlands. These community forests, they say, could serve as a common source of fuel supply. They could furnish products for wood-using industries which might be established in the community. They could supply work for men who would otherwise be idle during the winter months. They could by careful cutting and sale of timber become a source of revenue to the town so that taxes would become ancient history, all expenses would be paid, and more than that—a balance would remain in the treasury for improvements.

There is another reason for the great confidence felt in the possibilities of community-owned forests. They have been successfully tried for three or four hundred years in the countries of Switzerland and Germany. Zurich in Switzerland has had such a forest splendidly managed for 660 years.

Before the war, Baden and Freiburg and Heidelburg were reaping profits of $66,000 and $46,000 and $12,000, respectively, every year from their city-owned woodlands. The smaller towns, too, were coming in for their share. One town of 7,000, owning 8,822 acres of forest, had an income of $60,227, from which, after subtracting an outlay of $17,810, there remained a clear profit to the community of $42,417.

So much for the money side of the matter. A Chicago man, George H. Maxwell, a short time ago voiced his opinions as to what American towns and cities should do, based on the experience of the older countries. This is a part of this vision:

"In the smaller towns and villages the idea of a town forest should go beyond the mere supplying of wood and timber. It should be also a part of the educational equipment of the community to supplement the manual training and other practical studies.

"We have much to learn from other countries. When we have learned to maintain in every town and village a public school combining the French schools for gardening with the Swedish schools for cooking and the Austrian schools for woodworking; when we have located such a school in the midst of a growing forest plantation where every child will learn to plant and care for trees, as well as to garden and to cook what comes out of the garden; then may we feel that we have solved the problem of public education. We will have solved, too, the problem of keeping the boys and girls on the farms and in the country towns.

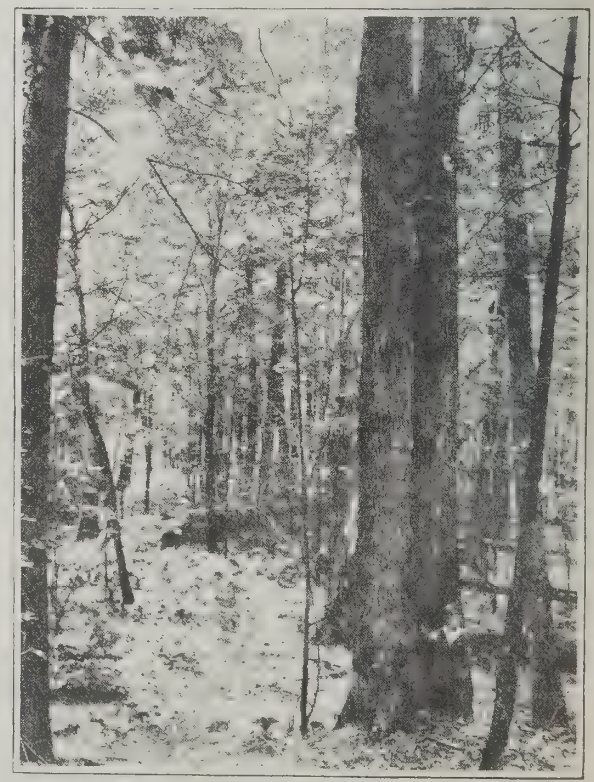
"Those who should be thinking the most about these questions are the farmers and the folks now living in such towns who want their children near them in their old age."

Then Mr. Maxwell continues: "What a transformation indeed will take place when the cut-over lands of Wisconsin and Michigan, for instance, have their original forest wealth restored by the creation of 'hand-made' forests, as has been done in the Old Country; when these re-created forests belong forever to the folks in the nearby towns and cities."

That at least a part of this dream may some day come true lies in the realization of such a plan as that of Raphael Zon, who is director of the Lake States Forest Experiment Station. His plan is concerned especially with the colonization of forest land and cut-overs in Minesota, Wisconsin and Michigan.

Each colonization project, consisting of several thou-

(*Concluded on page 15*)



A community woodland with its paths and drives and its opportunities for enjoyment and rest will lift that community to higher planes of thought and action.

The "Little Big" Man in High Places

How Industry and Ambition Gain Promotion

By ROBERT KENTON

SOME day public men may be rated and cataloged according to a scientific system, as are other animals and objects, and even the different sections of the human race.

These ratings will concern mainly three attributes:

1. Honesty.
2. Ability.
3. Energy.

Courage might be added, but when a man's rating in these three qualities is high, courage follows.

It is well known that there is no necessary relation between honesty and ability; a very able man may be wholly lacking in honesty and a scrupulously honest man may be lacking in ability.

A lawyer, for instance, once remarked that every judge should be honest and able.

"But the trouble with the judges around here," he added, "is that those who have ability are not honest and those who are honest have little ability."

Energy has much to do with a public man's worth, yet it is possible (as is not the case with honesty or ability) for public men to have too much as well as too little of this quality. A man can dissipate his mental powers by too great use of his physical energy; he may talk too much or run around too much. Again, a man's mental energy may drive him too far in advance of the people with whom (for the sake of service) he ought to be keeping pace.

Energy is a factor almost equally as important as ability or honesty. This quality is most difficult to estimate. The term "hard workers," applied either in public or private life, is regarded as a compliment. Sometimes, however, a public man who ordinarily would be reasonably safe and efficient is rendered dangerous and inefficient by being too industrious.

The Menace of "Little Big" Men

THE lawmaker who often achieves the greatest measure of harm is the dull, honest man who happens to be possessed of much energy. If he happens also to be ambitious he can become an influence for harm exceeding even the brilliant crook.

This type of public official might be called the little big man. That is, by reason of industry and ambition he frequently pushes himself into places calling for true bigness. The woods of public life are well populated with this type of public servant. Democracy (rather, what passes for it) peculiarly encourages the development of this type.

It is a very dangerous type. It is more dangerous in the making than in the administration of laws. It is more conspicuous in legislative than in executive positions. To it can be traced more pernicious legislation by far than was ever put over by deliberate malevolent intent.

In legislative bodies, the man of ordinary ability, though lacking in energy and without ambition to become a "noted statesman," often renders useful service. He attaches himself to a few leaders who have great ability and follows them. These leaders usually are honest and honesty seems to have the faculty of perceiving honesty. The result is that this kind of mediocre man, though a "me-too" type, generally acts wisely and safely.

In Congress there are introduced during each term from 15,000 to 17,000 separate and distinct measures; that is, proposed new laws. *If even half of them were enacted, the country probably would be wrecked.* If all of those calling for the expenditure of funds were to go through, there would not be enough money in all the country to meet the appropriations. Congress now passes only from 500 to 600 bills during a term. This is a great increase over previous records. But even so, only about one out of every twenty-five or thirty proposed measures is enacted into law by Congress, which means that the big work of real leaders is not in passing, but in preventing the passage of bills.

Some leaders are put in certain places chiefly for this purpose. The House Appropriations Committee, for example, always has had as chairman a man of the "Treasury watch dog" type—a man who could be trusted to deny rather than to grant appropriations.

For What Are Men Remembered?

MANY of the ablest men who have served in Congress are remembered best for legislation which they prevented rather than for what they accomplished. The member of the present United States Senate who probably ranks highest in the general esteem of the country rarely has been conspicuous in "fighting for" anything—except the defeat of measures he considered to be improper. This Senator, however, has great ability, is unimpeachably honest, intellectually and otherwise, and, when aroused, he is very energetic.

Few names that have been identified with outstanding laws enacted by Congress are associated even in popular estimation with the highest statesmanship. One needs not call names to prove this contention. All that is necessary is to ask the reader to review the "named" laws which have come forth in recent years. By "named" laws is meant those which are referred to as the Smith-Smith or the Jones-Jones acts of which there have been many during the last ten or fifteen years. With only a few exceptions the names thus preserved are forgotten or are unknown in all other connections.

This doubtful or spurious sort of fame fascinates the mediocre type of legislator. With some of them, to have one's name attached even to a bill that doesn't become a law, but attains notoriety, is a glorious end in itself, worth seeking regardless of the character of the law or the bill.

Aside from some measures which have to be passed, such as the recurring tariff acts, the proposals which endow their sponsors with this sort of fame fall into two classes: One class of bills would open wide the doors of the public exchequer for a wholesale distribution of funds in some new direction. The other would provide for an extension of governmental activity (which usually means government interference) in some new quarter. Frequently both are proposed by the same measure, for nearly all authorizations of new expenditures carry with them extensions or expansion of government.

Sentimental Legislation

SOMETIMES the second class involves a proposed amendment to the Constitution. Nearly always the proposal contains the emotional appeal, the sentimental equation. Frequently there is much elemental merit in claims made for the proposal. For all kinds of things are wrong with the world, and it is not easy to demonstrate the cold fact that these things cannot always be corrected by constitutional amendment, by increasing the already vast numbers of inspectors and investigators and regulators directed from bureaus in Washington, or by adding to the tax burden on the people who must meet the cost of all such things. Argument for these proposals usually can be put forth in emotional or sentimental way, which, of course, is the easy way. Argument against them must rest on cold logic, and therefore usually requires sound ability, cold intellectual honesty, and often superlative courage.

Legislative bills that propose to do something for mothers or children or war veterans, or to correct this or that moral wrong, or undo some glaring social injustice, or provide easy money out of public treasuries for large numbers of people, are easy to advocate; it doesn't require cold logic.

Hence the mediocre legislator who is energetic and wants to make his mark requires little inducement to sponsor such things for the prominence they will give him in return.

There will always be many people to help him. Large and powerful organizations are often behind these movements. Capable people are ready to supply him with facts, even write his speeches, which in Washington is often done. They see that he is given publicity, which he sometimes foolishly mistakes for public acclaim.

Virtually any proposal that has organized backing can get sponsorship in Congress, especially if the outside promoters will do the "brain work," collect the facts, prepare the speeches, and help with the generalship. Even the parliamentary maneuvering incident to the passage of many bills is directed from outside of Congress. Several men in Washington who have never sat in Congress have attained high prestige as parliamentary experts through their work in supplying with generalship the members who sponsor such measures as are here discussed. But the member gets the "credit" for the achievement, or he thinks he does.

To Save an Industry From Sapiro Hands

Concluded from page 4

they merely doubted the Sapiro brand of it, and time has proved them correct, just as it has proved other agriculturists correct. Here, with a valuable crop, producing as high as $500 an acre and in a limited area, with a comparatively small number of growers, under conditions which the co-operative promoters themselves declare to be ideal, and with no attempt to break up the co-operative associations, these organizations destroyed themselves through the methods of operation followed by their leaders. This is one of the clearest-cut, most interesting, and most decisive tests to which the co-operative movement—as sponsored by Aaron Sapiro—has been put in America. It resulted in complete failure for that form of the co-operative plan—the one sponsored by Jewish influence.

In connection with this, there is a lesson in the manner in which the hop-growers who refused Sapiro's overtures maintained their industry. When the members of the co-operative associations were receiving 16 and 17 cents for hops which cost them 18 cents a pound to produce, the independent growers were receiving 23 to 25 cents a pound.

As a matter of fact, *all the hops were selling at these higher figures* in the markets of the world.

But the high expense of distribution and selling under the Sapiro Plan *ate up one-third of the money which the members of the association should have received.*

The other growers, selling *direct to the consumers,* as they do today, estimated that their costs of distribution and sale, during the period of low prices, averaged one to one and one-quarter cents a pound; the costs of distribution and selling to the members of the Sapiro associations averaged *seven cents a pound!*

Jewish "direction" of the American farmer is expensive!

Let Trees Play Godmother to America's Towns

Concluded from page 14

sand acres, according to his plan, will be cleared wherever soil and location are good for farming. Whatever land is non-agricultural will be kept in woodland or reforested for future use, as the case may be. Each farmer, as he becomes a colonist, will be given a forty-acre share of woodland, either having the trees on his own farm or in a general forest. As community centers spring up, each citizen of the community will have a forty-acre ownership in a general forest. Thus will a large woodland become community-owned on each colonization project, to furnish protection and profit, wood and work. And it will, besides, in time, become playground and park—a peaceful haunt for men, women and children.

In addition to all the other ways in which a community forest "takes care" of town, city, village or rural community, there is always that silent influence of trees over folks—the happiest gift they can give.

Each community forest should be a park, kept as much like nature intended it as possible. Those of Rochester, New York, and of Washington, D. C., with their paths and drives, are delightful examples. There every citizen of the community can go for holiday pleasure; there they may camp for a time, if they wish, in the genuine out-of-doors. A community woodland, in fact, once owned and rightly managed, will be found to be that community's inspiration, lifting everyone to a higher plane of thought and action.

One of the greatest objections to starting private woodlands has been the fact that trees grow slowly. It seems to many the work of a lifetime from which the owner reaps but little benefit; but when developed by a community, the forest is to be kept permanently for the good of many for years to come. Thus the work never seems hopeless. Besides, care and attention often cause trees to mature more rapidly than when just growing wild.

A world of possibilities exists for communities in the owning of trees. Wealth, health and inspiration come as the coveted gifts of a godmother to each town or other community so fortunate.

There's another happy side to the story. Each community so blessed cannot keep that blessing for itself alone. That wealth of forests kept or revived must extend as a gift to the nation as a whole. And each town or city, village or rural community, owning a forest will in turn become "godmother" to America's tree-life which the nation so longs to protect.

Welding Together of the World's Peoples

Concluded from page 2

be built on memories, we have not had. Only in our western hemisphere has any other distinctive group of highly developed peoples lived so short a time. Our American nationalistic memories are only 150 years old, while one-third of our people have no American group memories, but have come to America from groups most of which, in Europe or Asia, are, roughly, 1,000 years old. America will have difficulty building strong nationalisms solely on her short memories. Also we must not expect that those numerous nationals among us can at will forget the emotionalisms of their age-long past.

Another of our difficulties is due to the fact that we are not a homogeneous people—either a single ethnic group or a well-amalgamated folk. We are heterogeneous to the extreme. Not even Argentina has so varied a population. We are not yet sure what the future physical American will be. All we know is that he is still being formed.

We have no indigenous American language. America, unlike most of the independent nationalistic groups in Europe or Asia, has a borrowed tongue. And this English language which we commonly speak is, as yet, not so common but that millions of our residents cannot use or understand it.

As to a nationalistic religion, we have none. The fundamental law of our land forever separates church and state. Undoubtedly, Mr. Justice Story spoke the belief of present-day Americans when he said that "half the calamities with which the human race has been scourged have arisen from the union of church and state." Granting this as true, the wise use of religion, as of democratic civil rights, seems to be a matter of slow understanding by persons who have long been herded by the power of an undemocratic government. When we consider the tremendous power religion has exerted in the civil life of peoples, the thoughtful man must ponder at the possible outcome of the irreligion of America today. Many Americans have failed to recognize that intelligent and motivating religious truths assist greatly in making individuals better citizens.

To offset our serious difficulties in the maturing of American nationalisms, we possess three dominant assets:

The first is our geographic isolation, fortunately far from the historic hatreds and fears of European groups.

The second is a gripping environment, which eventually will make us all Americans by breaking those who will not be made American.

The third is such vital, idealistic hope for a realizable future in America as no nation before has held out to individual men. It is this democratic hope to be a part of existing America which has lured virile men to our shores, and on the realization of this steady hope will America's nationalisms largely be developed.

As Americans we are interested in the development and maturity of American nationalisms; first, because we are confident that the ideals of our American nation hold a great wealth of unique blessing for her citizens; and, second, because we believe the constant attempt to perfect her democratic idealism is the surest step toward the longed-for future Brotherhood of Man.

BRIEFLY TOLD

Six of the fourteen provinces of Argentina have already adopted eight-hour-day legislation.

A fire in the Arapahoe National Forest in Colorado started from a camp fire left smoldering by careless motorists and burned 2,500 acres of excellent pine timber in a little more than three hours. This rapid destruction took place despite the fact that officers of the Forest Service, with a force of 250 men, began fighting the fire almost as soon as it started.

A remarkable flight of the painted butterfly in California has been followed by a serious outbreak of caterpillars, which are attacking garden plants of all kinds.

The United States could support a population of nearly 300,000,000 with no greater relative dependence on other countries for food and raw material than we have today. A population of that size would, however, have to go on a very different standard of living than we now hold and the productivity of farm and forest land would have to be held at a much higher level than at present.

Withdrawal of the water supply from the wild lands of South Africa by agriculturists has caused the death of many elephants. The animals raid the ranches and are shot by the settlers.

Old York and New York have been linked together by the unveiling of a tablet in the ancient city by the younger municipality, the Duke of York performing the ceremony.

The Order of St. Gregory the Great has been conferred by Pius XI on William C. Prout, leader of the United States Olympic forces in the games at Paris.

More than 4.300.000 illiterates will be entitled to vote in November for President of the United States.

In unveiling a war memorial recently General Sir Ian Hamilton said: "There is no getting over the fact that tragedies make good copy and that goodness makes bad copy. Therefore a feeling of hopelessness comes over the man who wishes to point out to his fellows the wonders and beauty of peace."

In the year 1907 China enacted the most spectacular moral reform in history. To free themselves of the opium slavery they plowed up the poppy on a million acres of land, closed up 500,000 opium dens, and old smokers stacked up their pipes in the market places and burned them.

At the recent sale of the Britwell Library, Dr. A. S. W. Rosenbach, of New York and Philadelphia, paid $9,300 for one of the five copies known of the seventh edition, 1632, of Shakespeare's "Rape of Lucrece."

A committee from the American Bar Association, after examining the law courses of twenty-five of the leading schools of the country, reports that in only nine of them is a study of the Constitution compulsory, and in two of these attention is given only to the purely commercial or legal value of it.

The old lighthouse of St. Agnes on the Scilly Islands has been converted into a holiday home.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Pneumonia promises to be deprived of its annual toll of 45,000 lives by the serum developed by Dr. Lloyd B. Feldon, of the Harvard Medical School. The substance is a white powder or antibody against pneumonia. It was discovered after five years of work following the influenza epidemic of 1918.

Ordinary glass windows keep out the healing and stimulating ultra-violet rays of sunshine, but panes made of quartz would let them through. Dr. Edward R. Berry, a director in the Thomson Laboratory of the General Electric Company, has perfected a method for making fused quartz which promises to be an incalculable boon to the medical profession.

News that a new automobile highway more than six hundred miles long, joining the Congo with the Nile, affords ample proof that complete seclusion from civilization becomes ever more difficult to find, even in darkest Africa.

It is claimed by scientists that the results of taking from the earth such vast quantities of oil, relieving as it must certain pressure from within the earth, may prove serious. The exact nature of such results is, of course, merely a matter for speculation.

"Everything in life should be taken earnestly, but nothing should be taken tragically."—*Edouard Herriot.*

"A Republican is a person who thinks a Democratic Administration is bad for business; a Democrat is a person who thinks a Republican Administration is bad for business; both are right."—Prize-winning definition in a competition held by the Baltimore *Sun.*

In that strange country the chief sound of life is a hiss, according to the fascinating report of William Beebe, the naturalist, in "Galapagos: World's End." Man has not penetrated Galapagos, which is on the equator, and the animals reign supreme—and peaceably. The fear of man is unknown to them.

The journal of Columbus during his first voyage to America, discovered in Madrid in 1820 and buried until recently in archives of learned societies, has recently come to light and been translated into English.

The Tower Bridge in London costs $165,000 a year to keep in repair.

Jugo-Slavia has the smallest navy in the world. It only possesses a few monitors for service on the Danube.

Shuddering is caused when the brain receives a sudden shock, and the heart momentarily ceases its function of pumping blood.

King Alfonso of Spain, who is corporal in the Italian Fascisti, is the only reigning sovereign who holds such rank in the irregular forces of another country.

Broad arrows are no longer used to mark the clothing of British convicts, and the authorities are considering a scheme for giving the prisoners lounge suits to wear.

A drove of "floating islands" was recently encountered by a steamer off the coast of Borneo. The largest was about seven acres in area, and contained palm trees more than a hundred feet high.

The brain of an ant is about the size of the head of a darning needle. These insects live from eight to ten years as a general rule, although specimens in captivity have been known to reach the age of fifteen.

Mail bags are now picked up by airplanes in full flight by means of a hook which seizes a rope to which the bags are attached.

The city of Paris is in debt to the extent of five million francs, but among its possessions are articles of furniture and art treasures worth 320,000,000 francs.

Bobbed hair has ruined the hair-net industry in China. With the cutting of the queues after the revolution of 1911 there was placed on the market in China enormous quantities of human hair which led to the development of the hair-net industry.

Eight and one-half per cent of the landowners in fifteen corn and wheat producing states in the upper Mississippi Valley lost their farms in 1923. The average price of plow land fell from $70 an acre in 1917 to $22 in 1923.

When asked by a fellow passenger why, after spending millions of dollars in advertising, he did not stop and add the money thus saved to his profit, Mr. Wrigley, of chewing gum fame, said, "We are traveling west at sixty miles an hour. Where would we be tomorrow at this time if we took the engine off the train?"

Crop and market reports sent out by radio from Washington have in many instances been the means of farmers literally picking dollars out of the air. Also use of the air mail in dispatching crop reports to the Department of Agriculture at Washington will be a tremendous advantage to agriculture and industry and means not only a great saving of time, but a shortening of the period between the receipt of the reports and the date of their release at Washington.

More than eighty-five per cent of the United States' corn crop is fed to livestock and somewhat less than ten per cent is used for human food. The hog is the largest consumer of corn, forty per cent being fed to swine on farms. Horses and cattle are next in order.

The Fight for Prohibition in Scotland

Influence of "the Trade" Is Bulwark of Wet Forces

By PAUL TYNER

PROHIBITION on a national scale will not come all at once in Britain, any more than it did in the United States. It will probably be preceded by many less drastic and radical attempts to deal with the drink evil; always with the idea of lessening rather than eradicating it and with an effort to reconcile prohibitive or regulative legislation with British ideas of "individual liberty." Scotland already has had local option for seven years, and although comparatively few districts have so far voted "dry," this is due largely to an ingeniously contrived wording of the Temperance Act of 1917 to make it ineffective—a contriving effected through the sinister influence of vested interests in the beer and whisky traffic.

When the Labor government came into power there was some expectation that it would favor the amendment of the existing local option law, for it is well known that Ramsay MacDonald is himself a Prohibitionist in principle and that Edwin Scrimegeour, member for Dundee, is only one of a number of men who are Prohibitionists in principle among the Scottish members. But it was soon officially made manifest that the present government is not particularly interested in real temperance legislation. Mr. Adamson, the secretary for Scotland, in reply to a question by Mr. Sturrock, a Scottish Liberal member, said that he had received and considered a number of representations regarding the Temperance Act of 1917 (the local option law already mentioned); but that he had not undertaken to institute any inquiry into the matter, and he was "not at present satisfied that such an inquiry was necessary."

The "wet" interests, of course, are too subtle to make a direct frontal attack in the shape of legislation for the annulment of the local option law. With most suave, not to say pious, assurances that they favor "real temperance" with all their hearts, they will endeavor to sidetrack the real issue by obtaining legislation in the shape of some compromise with the problem which, while satisfying the "Moderates," will really clinch more firmly the "wets'" hold on the country and retain their control on the two old parties. However strong Prohibition sentiment may be in the Labor party, it is not a plank in its platform; and even if it were, the introduction at this time of a Prohibition measure would be the signal for their overthrow from power, as surely as would the introduction of a capital levy or a land nationalization bill. Whether the liquor interests will manage to obtain the same control in the Labor organization that it now exercises in both the Conservative and the Liberal machines only the future can show. The test will come when the Laborites return to Parliament with a majority of the electorate behind them. Just now it is certain that the political and social forces identified with the liquor trade directly or indirectly are the traditional foes of Socialism: the Jewish financial and commercial powers, the aristocracy and the moneyed classes.

The Great Power of "the Trade"

IN THE House of Lords recently the cloven hoof was shown during the second reading of Lord Lamington's "Public House Improvement Bill." This measure provides that where licensed premises contained adequate provision for the supply of other refreshments than alcoholic liquors, were commodious and comfortable, had proper seating and sanitary accommodations, and contained provision for suitable recreation, the licensing boards should certify that the premises formed an "improved public house," and such premises should enjoy special privileges and exemptions. The certificate would be deemed to include licenses for music, dancing and entertainments; the presence of children was not prohibited, and the holder of a certificate would be entitled to a rebate of one-half the license duty. Lord Lamington said he wished, through this bill, to abolish the many dens and snuggeries which existed for merely drinking purposes.

The very bringing forward of this measure indicates that the "interests" are at least waking up to the fact that the public houses or, as we call them, "saloons," must be made "respectable," if the fight against their perpetuation is to be disarmed.

While there is certain evidence of a slow but steady rise in the tide of Prohibition sentiment in this country, it was not shown markedly in the last elections, so far as the count of votes goes. More districts went wet than went dry, thanks largely to the fact that the Local Veto Law (Temperance Act for Scotland) passed in 1917 is such a sham that many real Prohibitionists refrained from voting, while in several instances it proved so unjust and unworkable in districts where local option under it had been voted in three years ago that the electors voted against it this time. For one thing, elections held under it must be three years apart, and the exceptions and exemptions provided in it favoring hotels, clubs and restaurants practically nullify it and emphasize its nature as class legislation favoring the rich as against the poor. "No license" under it would not only "deprive the poor man of his beer," but most flagrantly leave to the rich man unrestricted indulgence. So unless the present act is amended by the Parliament now sitting or by the next Parliament, it will be three years hence before Scottish electors will have another opportunity to express their will on this issue. But Scotland is ahead of both England and Wales in having any local option law at all, and one of these days Scotland will surprise all Britain, as did Kentucky in the United States, by going dry—and that will be the beginning of the end of the long and mighty sway of the whisky trade in the British Isles.

It had been a picturesquely red-hot campaign. Striking features in a procession of the "dry" forces were floats showing the home of the drunkard with wife and children in rags, a bare room with empty larder and empty grate. In contrast with this was presented the cheerful, happy home of the temperate man with well fed and clothed wife and children smiling welcome to his homecoming. Still another float showed twelve shillings' worth of bread in a piled-up heap of loaves, and beside it a bottle of whisky, all topped by the legend:

> "TWELVE SHILLINGS WILL BUY THE
> BREAD OR THE BOTTLE. IF BREAD
> IS YOUR CHOICE, VOTE NO
> LICENSE."

Processions of the "NO CHANGE" (wet) party, on the other hand, depicted Scotland in chains with a lot of gloomy and cowed workers cruelly deprived of their beer by grim and saturnine fanatics who held the rod over them. Other posters of the "wets" that plastered the town made luridly pictured appeal to Scottish patriotism and love of freedom. "SCOTS WHA HAE" is the simple sentence on one poster, running across the Wallace tartan, an allusion to one of the most stirring and familiar of the songs of Burns.

The churches of Dundee were almost solidly for "No License," as far as the ministers and most of the "elders o' the Kirk" are concerned; but not one of the three daily newspapers were on that side. During the campaign there were meetings in nearly all the churches every night. In addition, open-air meetings, despite wintry weather, were often kept up until midnight, as many as a dozen going on simultaneously in various parts of the city. But the "wets," or as the people here denominate the element interested in fighting Prohibition, "the Trade," meaning the liquor and beer trade, had the heavy battalions on their side. Money was spent freely in publicity on the largest scale. They had organized workers among the publicans and their cohorts, and among the employes of breweries and distilleries. About 200 motor cars and dozens of autobusses and char-à-bancs were out on election day carrying voters to the polls from rendezvous near the closed "pubs." It seemed obvious that "the Trade" had planned on countering the work of the good women who have been working like beavers in their appeals to the public to vote "No License" to "save the children and the home." This counter-move took the shape of carrying to the polls in their autos thousands of the scum of the slums and the denizens of what in America used to be called the "red light" districts. To many of these women, a ride in a motor car is a tempting luxury. And it is whispered that, although the Corrupt Practices Law here is very strict, there is nothing in it to prevent a man from "treating" a friend to a *bottle* of whisky—even if the retail cost is twelve shillings—or more than double the pre-war price.

In a talk I had with a prominent "dry" worker one night, he told me that these poor alcohol-sodden creatures were far from being the most potential element they had to fight. "The influence of the Trade," he said, "is most subtle and widespread in its ramifications. The liquor interests are among the largest advertisers in the daily and weekly press. They are a power in the business and financial world, and they are the dominant power in politics. Whisky and brewery shares are a prime investment and widely held. The Trade dictates not only to retailers and wholesalers in their own line, but also in other lines only indirectly connected with the sale of liquors. These include the grocers, hotels, restaurants and theaters and other entertainment enterprises. No man in public life dares to antagonize the Trade. Consequently their chief strength in the election was not merely among the ignorant masses, or the slum women, but among the respectable and educated so-called "pillars of society."

Pointing the Finger at America

AS I have mentioned, the opposing forces in the election were lined up under the slogan of "no license," on the one hand and of "no change" on the other. This needs explanation. The ballot voted in November contains three options: "1. That there shall be *no change* in the existing regulations of the liquor traffic; 2. That the licensing authority shall limit the number of licenses issued hereafter to three-quarters of the existing number; 3. That *no licenses* shall be issued, except for inns and hotels or restaurants in special cases.

The nigger in this wood pile is very ill concealed; his wool is sticking out of one end and his feet at the other. What is the answer to the puzzle? Whv simply that the bill was drawn by Lord Younger (then Sir William Younger) one of the biggest millionaire brewers in Britain, chairman of the Conservative party and leader in the House of Commons of the "Die-hards" who opposed Lloyd George's settlement of the Irish question and who were active in bringing about the disruption of the Coalition government. On the return of Bonar Law to power, Younger was rewarded with a peerage in return for his "patriotic services"—a euphemism for big contributions to the party cash box and for shrewd and sharp management of the campaign that sent Lloyd George into the wilderness.

This Act of 1917 is, in fact, not even a compromise; but the merest of subterfuges shrewdly framed to hamper in every way possible the growth in Scotland of an anti-saloon sentiment, and to make practically impossible any real restriction of the liquor traffic, or amelioration of the evils produced by it. The bill was roundly denounced on the floor of the House of Commons as a sham by Edward Scrimegeour, the lone champion of Prohibition in the British Parliament. He carried his opposition to the whole business so far that he refused to take any part in the local campaign in his own town, although he arrived in Dundee three days before the election to address the electors in his own campaign for his re-election as senior member for Dundee in the snap general election for the new Parliament following shortly on the local wets' election. It will be remembered that Scrimegeour put Dundee on the map when at the general election of last May he was returned by an immense majority over Winston Churchill and went up to Westminster with a Prohibition bill in his pocket. True, he was not elected because he was a Prohibitionist, but went in on the tidal wave for the Labor party in his district, largely because of his personal popularity and the people's admiration for his pluck in standing again and again as a candidate against great odds. But his election gave great heart to the newly formed "No License party," and while some regret is expressed by local leaders that they should be divided from him for the time being by "a difference in tactics," there is no falling off in his popularity and no shadow of doubt as to his unfaltering allegiance to the Prohibition cause in its essential singleness and simplicity.

Conspicuous in the propaganda against "No License" is an insistent playing on the note of *"Prohibition has failed in America and Prohibition would fail here."* This legend in big black and red letters stared at one from the dead walls and perambulating barrow placards and on sandwich-men posters. The newspapers regaled their readers for months with lurid tales of wholesale violations of the law in America, of the poisoning of thousands of persons by the wood alcohol route; of the impunity with which the rich procure the wine, beer and whisky denied to the poor man by high prices. Scenes are portrayed in the viler purlieus of New York and Chicago, where it is alleged that liquors of the most poisonous sort are openly sold and scenes of utter depravity are common. Appalling statistics as to alleged increase in the number of opium and cocaine victims are furnished. Rarely are the facts as to the diminution of poverty, vice and crime given in the press. Even the carefully verified report of the special commission sent to the United States to examine and report on actual results of Prohibition has had to depend upon the circulation of a pamphlet got out by the Church of Scotland. In Dundee itself, the report of the Rev. Dr. Adam Ferguson of the United Free Church served as a sort of counterblast to the garbled and biased "wet" propaganda. The great trouble, of course, in any such controversy is bias of feeling and motive on either side.

Drink Dominates Dundee

IN NO city in the world that I know is the power of the liquor and brewery interests more brutally rampant and dominant than in Dundee, or the degradation of its victims among the masses more flagrant. Young women workers in the jute mills are often seen reeling through the streets, singing and shouting maudlin songs as late as two o'clock in the morning. Instances are quite common where the women are the bread earners and the men left at home to look after the house and the children—in sorry fashion certainly.

There are as many "pubs" as there are "kirks," which is saying a great deal, and they are much better patronized. Lines are in waiting for the opening up of these drinking places for three hours in the middle of the day and again for four hours beginning at 6 p. m., under the present restrictions initiated during the war and continued with some modifications. And they are filled with men and women using every available moment of the limited hours in greedily imbibing beer, gin, and whisky or bad port wine.

Like every other center in the British Isles then and today, Dundee had been suffering from acute unemployment and from the protracted idleness caused by the boiler makers' strike. In every "pub" strikers put in most of their time, spending in drink (that soddens brain and corrupts body) the strike pay received from the unions. In the same way the unemployed got rid of the "doles" received from the government while in many, many cases their wives and children went hungry and in rags. Over and over, social workers have found in the tenements women with children newly come into the world and no shred of clothing provided for them; "homes" without even a bit of coal to warm their cheerless cold and dampness, or a morsel of food in the house, while the husband and father had to be sent for to a neighboring "pub" and brought home in a hopelessly stupid and besotted condition.

Yet it must be said that there are a great many teetotalers among these workingmen and women, and even among their much abused leaders. The very extreme of sordid misery, so obvious and prevalent, has stirred the decent elements of the community to greater earnestness and fervor of protest against the drink evil—and to intensity of determination that it shall be wiped out. They are in a hopeless minority as yet; but they are waging a patient and plucky fight against overwhelming odds.

It should not be overlooked that there is a third movement under way. It is called the Moderate Movement and favors a "Reformed Public House." As a step in this direction, it urges the voters to cast their ballots for the middle option offered on the ballot calling for a cutting down of the number of public house licenses by one-fourth. When I was in Glasgow, during election week there, Bishop Weldon, of Manchester, and

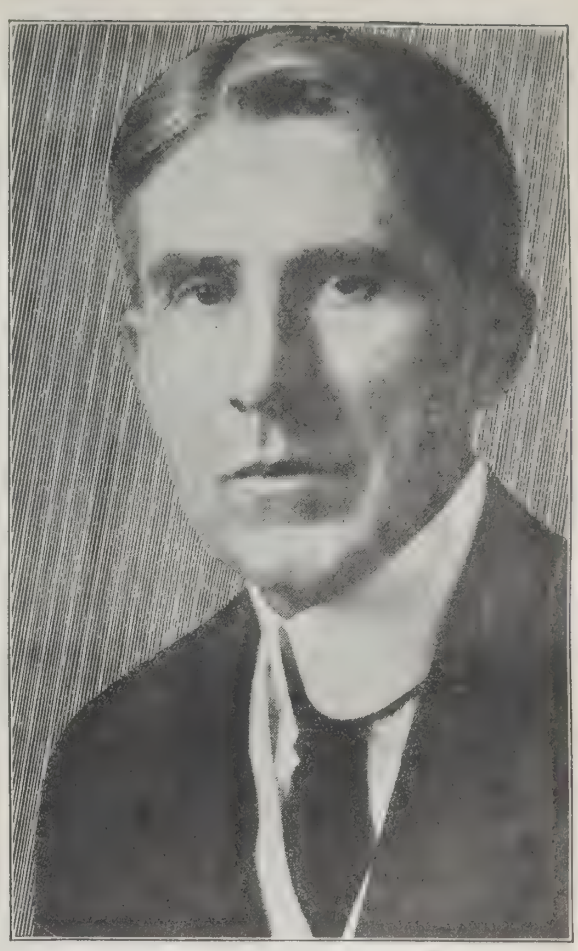
How Zane Grey Is Discovering Our America

Graphic Life Story of the Wizard of the Canyons

By FRED L. HOLMES



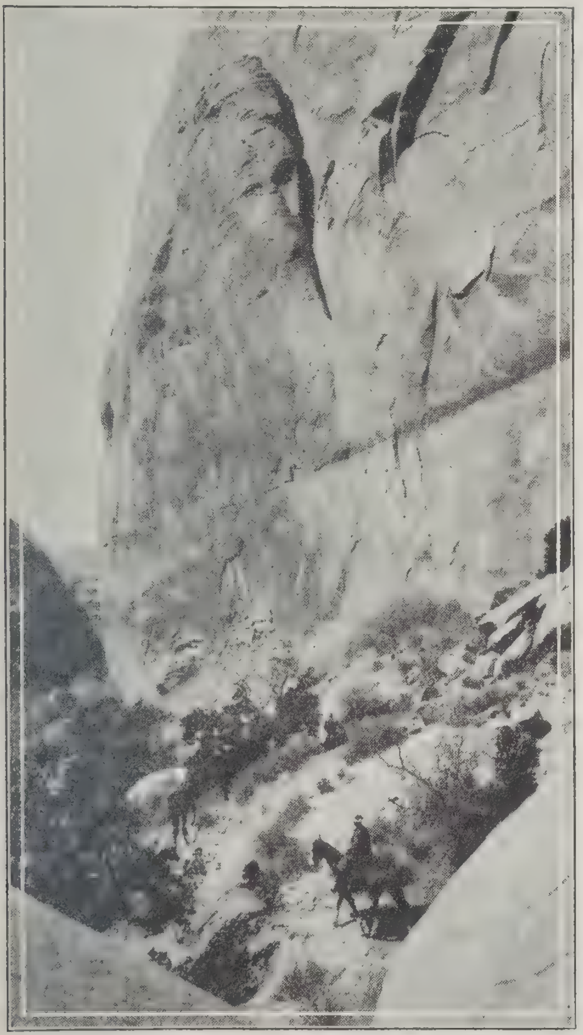
ZANE GREY

More than ten million copies of his books about America have been sold.

AT A corner of Pearl street in New York there stands a tall, iron lamp post. For a good many years it has been holding high a light to illumine the footsteps of passers. Aside from a black exterior, however, it has neither distinction nor individuality. But in the mind of Zane Grey, the noted author of outdoor romances, it has lifted a heavier burden. Against it Grey leaned, after a battle of seven years to become an author, when life was darkest. It gave him support to fight on.

"It seemed to tell me from its cold touch that those who had refused to publish my book were wrong," said Mr. Grey. "The tears in my dimmed eyes dried with the message. I took on a new courage. I went home and told the story of my failure to my wife. She refused to accept the mandate of the publishers as final. So I went to work again."

"You persisted and won," I interrupted, "after seven years of poverty and failure, because you felt that writing was your profession."



On the trail by the stone-walled canyons.

"Call it anything you want to," he said. "The moments that preceded my leaning against that lamp post were the most bitter in my life. I never go to New York, but I visit the spot and rest against the old support. To look back on those disappointments is one of the compensations of my life. I don't care now that I have won. That's the point—to persist and win."

Since the shadows have lifted, Zane Grey looks upon his years of failure as a training school. Through all his discouragements, confidence in his own abilities sustained him. He gave up a profession. He exhausted his own funds, and the savings of his wife. But in the end he has achieved. Ten million copies of his writings have been sold. Probably no author in America has had his books more screened. He has told the story of the deserts, the mining camps, the canyons, and the wild places of America. He has become the leader in portraying American romances with settings in faraway spots. To reach the eminences he has had to convince publishers of the demand for fiction about the out-of-doors. The public accepted him at first opportunity.

Zane Grey traces his ancestry to the first Zane who was exiled from Denmark and came to this country with William Penn. The founder of this family of Zanes in the New World married in Virginia. His four sons and a daughter became characters in frontier history and in the American Revolution.

There was a spirit of adventure in the blood. One of the sons crossed the Alleghanies and tramped over the fertile lands of the Ohio. He liked the country so well that he went back and got his brothers to join him. They bought Wheeling Island, West Virginia, from Cornplanter, an Indian chief. There they founded Fort Henry, defended it with their rifles against Indian forays and on this spot helped to fight the last battle of the Revolution—the siege of Fort Henry in 1782.

It was during this battle that Betty Zane performed her famous feat of carrying gunpowder in a sack over her shoulder to the besieged. This saved the fort. Likewise it furnished the theme of one of Zane Grey's early stories. The thrill in the writing of this tale about his own people determined him to become an author.

The first Zane to cross the Alleghanies was Ebenezer. George Washington came to visit him at Fort Henry and foreseeing the need of a road to communicate with the interior, commissioned the pioneer, already known as "colonel," to cut one through the wilderness from Wheeling across the Ohio to Kentucky. Pioneers who followed called it "Zane's Trace." It is now a national turnpike. For this service, the Zanes were given 10,000 acres of land in Ohio. One of the brothers, Jonathan, sought the interior and founded Zanesville, Ohio, in 1799.

It was in Zanesville that Zane Grey, a lineal descendant of Colonel Ebenezer Zane, was born in 1875. The mother desired that the child bear her family name. His father was agreeable. He was a backwoodsman, hunter, farmer, preacher and finally a doctor. In the city made famous by his ancestors, the boy was early schooled.

"Many of my readers think I am a woman," confided Mr. Grey, relating the story of his family. "Your men write me for photographs and sometimes I send one along as a surprise. I was named after my mother's people—who had Indian blood and were among the first settlers in the Ohio valley. There was a spirit of the pioneer on both sides of the family. Both families were pathfinders. I come naturally for my love of the great out-of-doors.

"Three years ago I went back to Zanesville for a visit. It seemed strange and somehow wonderful to have old women who knew me as a child tell me how I used to babble, 'I'm agonna kill bars and bufflers.' Also I was reminded by my school teachers how I hated to study.

"The woods and the streams and the waterfalls were still there. I had changed but they had not. Visiting these old streams, so strange and yet so vivid in my memory, taught me that it was here that I had learned to love the sight and sound of running water, all the finny inhabitants of the streams and the leafy, cathedral-like serenity of the woods. When I was a boy I wrote crude stories of hunting and fishing. I wanted to be a writer. With some of the boys of the neighborhood, we dug a cave back of the bushes in the back yard, and carried out boy exploits."

During young manhood, Zane Grey was a baseball star. Had he continued, he would doubtless have made a major league. His ability to throw a "crooked" ball attracted the attention of one of the graduates of the University of Pennsylvania who was witnessing a back-lot ball game. This man induced Grey to go to college. Those were the days when the alumni were on the lookout for lads who would score in athletics and place high the record of their Alma Mater.

"I hated the college lecture rooms," Grey went on. "I could not listen. My thoughts wandered afar, if not in green fields and quiet woods, then in dreams that might come true. I was a poor student. I was shy and diffident. I never came to notice at college until Arthur Irwin, the famous coach of baseball at the University of Pennsylvania, sought me out. He caught me throwing potatoes at some students who were trying to capture me in a hazing affair. I was hitting every pursuer as he advanced. Irwin saw in this feat athletic possibilities. So I got on in college in spite of the fact that I was out of my element.

"I shirked the quiz classes and the laboratories. But somehow I passed my examinations, perhaps through the grace of my professors. One of the old sages remarked to me, 'Well, Grey, you know a heap more about baseball than you do about chemistry.'

"The one place at Pennsylvania that I loved was the library. I used to go there and sit awhile in the subdued light of the domed edifice, feeling a strange and a deep force, inscrutable and perplexing, at work within me. I seldom read anything. I always slipped in there when I was depressed and unhappy; and seldom did I leave without having received some help, some hope, some subtle intimation of the future. But even then I did not realize that literature was my calling."

After he had graduated, he played professional baseball with the Newark Eastern team, the Findlay Tri-State League and the Jackson-Michigan League. Then he went to New York to practice dentistry. He entered the profession at the request of his father, but didn't like the work. R. C. Grey, his brother, the professional baseball player, helped him to get established. Patients began to come. Meantime he kept wanting to do other things. At his brother's suggestion, he wrote the story about Betty Zane, the famous sister of his grandfather.

"During a winter in New York, the book was written in a small flat," he explained in detailing his early difficulties. "Mice scampering about the floor were the first witnesses to the preparation of the copy for my first novel.

"The completed manuscript was refused by a dozen publishers—but I borrowed money and published it myself. The book is still selling."

About this time, two things happened to change the course of his life. He married. Then he gave up his profession. He decided that if he was to make a success, all of his energies must be dedicated to the task that he loved. His loyal wife agreed.

For two years he labored on two books of romance on early Ohio history. Publishers refused to buy them. "The Spirit of the Border" and "The Last Trail," he gave without recompense to A. L. Burt just to see them in print.

Borrowing money from his brother, he bought a cottage at Lackawaxen on the Delaware River. There he toiled and wrote. He saw the apple blossoms of spring fade and fall; the summer ripen the fruits and the winter come with all its rigors. Years following months, his labors through the changing seasons brought him no reward; no recognition from publishers.

At the end of six years his own resources were gone; most of the treasure of his wife had been spent uncom-

Have You Ever Signed a "Myself" Note?

Let Them Sue You; the Courts Say You Don't Have to Pay It If Given for Worthless Stock; New High-Tension Salesmen's Device

By E. L. M'COLGIN

If you have bought stock from High-Power Salesmen—

If you have signed notes—

If the stock investment has turned out worthless—

Or even if you have not done any of these things—

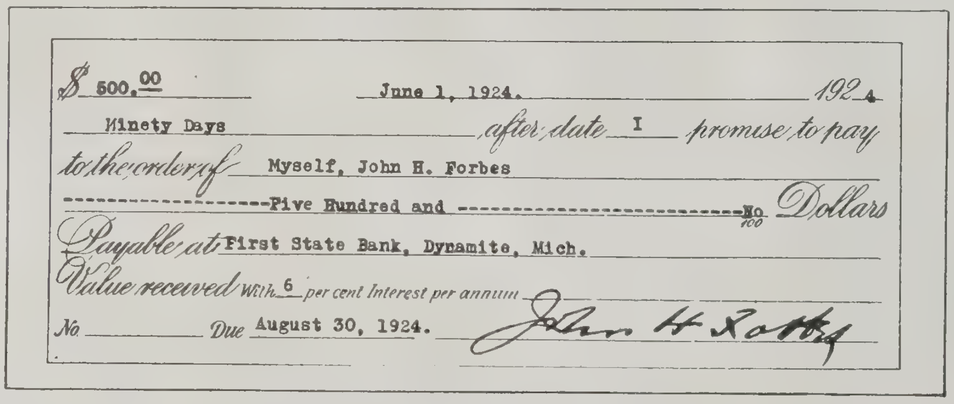
Read this for your protection.

HUNDREDS of country and small-town banks throughout the Mid-West have sustained heavy losses and many of them have been ruined through discounting or purchasing so-called "myself" notes, a definition of which is hereafter given. These notes had been obtained by high-tension salesmen from persons to whom they had sold stocks under misrepresentation.

Frequently these banks hesitated about dealing with the stock salesmen. Then they yielded to threats that should have provoked them to throw the rascals out of the bank.

These discount transactions were often rendered more harmful because some bankers betrayed confidential information about the worth of their depositors, which was used by the salesmen in selling stock to those people.

Briefly, the "myself" note is an unusual or bastard form of the ordinary promissory note. The essential difference is that instead of the maker filling in the name of another person to whom the note is payable, the words "I promise to pay to the order of" are followed by the word "myself" and then his own name. The maker of the note then endorses his own name on the back of the note he has made payable to himself, making it negotiable, and gives it to the stock salesman. The stock salesman can then collect the amount of the note when due or sell it to someone else by endorsing his own name on the back.



$ 500.00 June 1, 1924. 192 4

Ninety Days after date I promise to pay

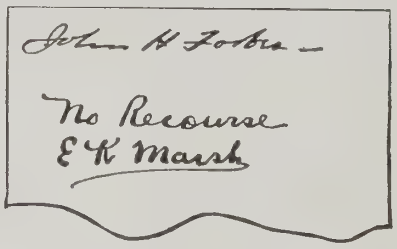
to the order of Myself, John H. Forbes

Five Hundred and No/100 Dollars

Payable at First State Bank, Dynamite, Mich.

Value received With 6 per cent Interest per annum

No. Due August 30, 1924. John H Forbes



John H Forbes

No Recourse

E K Marsh

However, in actual practice the stock salesman who gets a "myself" from an accommodating farmer, almost invariably sells it to a banker who knows the man who gave the note to be responsible and fully able to pay the bank when the note is due. Such banks are usually willing to permit the stock salesmen to shed their responsibility by including the words "No recourse" in their endorsements when they sign the note over to the bank.

However, recent decisions of Michigan courts have outlawed the "myself" note game.

It is highly important that people who have given notes for stocks make the banks or other holders sue for the money. The high-tension stock-selling crews, and people with whom and for whom they work, dread the publicity of such suits.

In the case of the Berlin State Bank versus Girow, the Kent County Circuit Court, Grand Rapids, decided that the bank, which had discounted the note Girow had given a salesman for Michigan Guaranty Company stock, had no cause for action. The bank did not appeal this decision.

It was charged that the bank had not observed good faith and was not an innocent purchaser. This bank with a capital of $25,000 is said to have discounted about $75,000 of these "myself" notes.

Thirty-seven other banks in the same section have been identified as having followed similar procedure, and this does not exhaust the list. Some of the banks failed, and others are carrying the stock in the hope of getting their money out of it some day.

The Michigan Supreme Court has gone still further in the case of George W. Miller and wife versus the Commercial State Savings Bank over a note given for Michigan Guaranty Company stock.

This decision makes it impossible for a bank which has discounted a "myself" note under the unusual plan the high-tension people have devised, to collect the note in cases where the securities were sold under misrepresentation. This destroys the plea that the bank is an innocent purchaser of such paper, even though the disloyalty of divulging the amount of depositors' wealth, as charged in the other case, is not present.

Michigan was one of the last states to be worked by "myself" note tricksters. Throughout the rest of the farm belt these notes have been taken for stocks in all kinds of promotions which have turned out to be failures and which have been discounted at the banks.

When western farmers became unable to pay these notes, and banks began to totter, the newspapers told the public that the banks involved had overstrained themselves *carrying crop loans!*

A description of the promotion that resulted in these Michigan decisions will make the whole "myself" note traffic clear:

The Michigan Guaranty Company of Grand Rapids was formed to lend money upon notes of borrowers secured by collateral or the endorsements of persons satisfactory to the company. Concerns in this field generally give the borrowers less money than what is shown on the face of their notes and charge them interest upon the full principal. Some companies make other additional charges. Where the management is capable and honest these companies can hardly fail to be profitable.

However, the stocks of these companies are generally sold by high-tension salesmen who represent them to be banking or trust companies and promise fantastic dividends. *The promotion expense is generally about thirty per cent* of the capital secured.

The Michigan Guaranty Company was first capitalized for $800,000. The organizing group subscribed for $400,000 of this stock, paying in $4,000 in cash and giving their notes for the balance.

Colfax Gibbs, a high-tension promoter, was engaged to sell the rest of this stock to the public. He peddled the stock in the country districts, avoiding the larger Michigan cities.

The Michigan Securities Commission restricts stock-selling commissions to fifteen per cent, but the company paid Gibbs an additional ten per cent as financial counsel, making his real fee twenty-five per cent.

Gibbs was provided with an ornate suite of offices in the fine building of a bank in which the organizers of the company were known to be influential. It was an impressive set-up and helped sell the stock.

A crew of hardened "dynamiters," as these high-tension salesmen are called, well trained in the "myself" note game, was mobilized by Gibbs. Many of them were imported from Iowa where they had sold $3,800,000 of stock in the defunct Associated Packing Company of Des Moines for the notorious Wolf Teitle who later became a sojourner in Grand Rapids. Gibbs was out in Des Moines when Teitle was taking the Iowa cornhuskers down the line.

Prospective purchasers of stock in the Michigan Guaranty Company were canvassed by Gibbs' dynamiters with the claims that it was a trust company, and that while it only promised eight per cent dividends the profits would be so enormous that the lucky stockholders would be still more highly rewarded. After the stock was sold the dividend was slashed to a nominal amount.

The purchaser was induced to make a cash down payment on the stock and to give the salesman a note made payable to "myself," the name of the maker of the note following this word. The drawer of the note would then endorse his name on the back of it and give it to the salesman. The salesman would point out that the big dividends would enable the purchaser under this plan to pay for the stock without using his other funds. The note would be reduced with dividend checks, and renewals were promised until the principal was paid off.

The Gibbs aggregation quickly sold the $400,000 to the public. The capital of the company was then increased to $1,600,000, then to $3,000,000, and finally to $5,000,000. Gibbs sold more than $4,000,000 of the stock, making the total outstanding about $4,500,000.

Gibbs' commission was at least a million dollars.

After getting the "myself" notes from the purchasers of the stock, the dynamiters then proceeded to debauch the smaller banks. They would first throw a scare into them by asserting that the Michigan Guaranty Company was organizing a trust company and was going to establish branches in the small towns in Western Michigan.

Bankers who gagged at the game would be met by the salesman's mock indignant threat: "What! your own depositor's note not good enough for you!"—and veiled threats of informing the depositors and thus create business for another bank. In far too many instances the threat worked and the banker who succumbed was led into the deeper secrets of this questionable game.

The salesmen would then endorse the notes they had secured from the stock purchaser, "no recourse," meaning the bank had no claim on them.

The pill was sweetened by showing the banker how he could profitably discount these "myself" notes without tying up a cent of his capital. Instead of asking for cash for the notes Gibbs would take the bank's certificates of deposit, bearing but three per cent interest and not payable until the note came due. Then the bank would pay Gibbs' certificate of deposit with money furnished by the farmer who had paid the note. Since the notes paid at least six per cent interest, the bank would make at least three per cent profit upon the notes of persons of good standing.

The "co-operating banks," as the euphonious phrase goes, were then asked to give the stock salesmen confidential information about depositors' accounts, always considered sacred by bankers. The bank officer divulging this data would usually be paid a personal commission of two and one-half per cent upon stock sales made with such assistance. When a dynamiter knows about a prospect's bank account and also what the banker thinks of the prospect, the rest is easy.

Some bankers who discounted the notes did not disclose their depositors' affairs to the dynamiters. However, the Supreme Court has decided that the banks had no right to discount these notes under an unusual plan without using due diligence to ascertain if they arose out of bona fide transactions.

During the trial of the suit of the Berlin State Bank against Girow, an officer of the bank denied on the witness stand that disclosures of depositors' affairs had been made and private commission received. After testimony to the contrary had been offered the banker asked permission to revise his testimony and, returning to the stand, he admitted the charges. This made it easy for the jury to relieve Mr. Girow of paying his note.

Some outraged persons who had become acquainted with these deals supplied Girow's attorney with the details of the damning facts. If people everywhere who get wind of like transactions would make use of it, and if victims like Girow would stand suit, in a short time all bankers would refuse to do any sort of business with high-tension stock promoters.

Notes given under these conditions and upon misrepresentation should never be paid. Let the aiders and abettors of the system sue, and thus be brought into the full glare of publicity.

Iowa farmers who gave "myself" notes for stock in the Associated Packing Company of Des Moines, promoted by Wolf Teitle, Sam Lanswick and Gerry Haines, and the luckless bankers who discounted the notes, will be interested in knowing many of their dynamiters went to Western Michigan to work under Colfax Gibbs.

Calot B. Morgenthaler, while not officially connected with Associated Packing, was a very close friend of the crowd and moved East when Colfax Gibbs introduced the Iowa crowd to Michigan.

Teitle, Lanswick and Haines, and their salesmen sold $3,800,000 of Associated Packing stock. Charges of conspiracy to defraud were brought but no convictions secured. The attorney-general's office in Des Moines did not cover itself with glory in dealing with this rotten case. But it is coming to be a common condition that where state and county attorneys fail, the Federal authorities usually win in stock-selling prosecutions. Why is it?

Morgenthaler became the fiscal agent of the Detroit Packing Company, for which he undertook to sell $2,400,000 worth of stock for a commission of approximately half a million dollars. The stock was sold to Eastern and Southern Michigan farmers on representations that their livestock would receive preference from the company.

"Myself" notes were taken from farmers in payment of stock subscriptions. Country bankers were coerced into discounting these notes by threats to have depositors change their accounts because of the implied reflections upon the goodness of their notes. Old stuff, but it always works!

Morgenthaler was compelled to end this because an

How Chinese Quacks Wax Fat

Credulous Americans Qualify for Wreaths in "Doctors'" Palatial Consulting Rooms

By JOHN SLOAN

Hangs Out His Shingle and Thereby Becomes a Physician

TO BECOME A PHYSICIAN, a Chinese states to his friends and neighbors, "I am a physician." This is the limit of required preparation, although it usually is a development from a former apprenticeship. The Chinese doctor's diploma is the more or less handsome signboard which announces his determination to the neighborhood. The man whose father or uncle was a physician before him has the supposed advantage of inherited recipes and secret family remedies, and the farther back the medical ancestry, the better. . . . The Chinese physician writes a prescription of first, second or third rate medicine, according to the ability of the buyer to pay. His diagnosis begins and ends by feeling the various pulses of the patient, two at a time.—Extract from "Diseases of China," by Jeffereys and Maxwell.

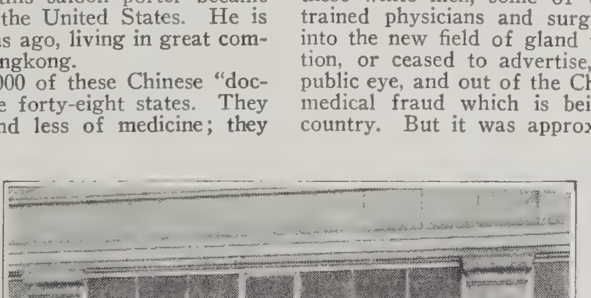
A GAMBLER by the name of Rosen, killing time one afternoon nearly thirty years ago, in a saloon in Denver, started a medical fraud which in the intervening three decades has invaded every state in the Union, larded the pockets of thousands of Orientals with millions of American dollars, and defrauded unknown numbers of white men and women not only out of their money, but out of their lives as well.

This man Rosen—masquerading at the time under the name of Mervin Carlyle—was the first to attain fortune as the result of the fraud the idea of which came to him that afternoon. He had been at a previous time the owner of an "Indian medicine show," at whose entertainments packages of dried leaves, grasses and twigs were sold as the original herbal remedies of the Indian tribes of the Western United States. As he leaned on the bar, an elderly Chinese porter came in to sweep the floor of the saloon. Rosen and the man behind the bar had been discussing tricks by which the public could be separated from its money, and the gambler, seized with a sudden crooked inspiration, said:

"Let's make that Chink a doctor! The Indian game's getting thin, but they ought to fall for the Chink."

That afternoon, Rosen retired from his place as dealer in one of the gambling houses of the city, and within a week, "Dr." Lo Hi Yet appeared in a finely furnished suite of offices in the heart of the city. Dressed in the gorgeous costume of the Chinese nobility —or what passed for that costume in the Occident—sporting the red button of the Mandarin and the peacock feather of the royal house, this saloon porter became the first Chinese "doctor" in the United States. He is still alive, or was a few months ago, living in great comfort in the British city of Hongkong.

Today there are nearly 2,000 of these Chinese "doctors" scattered through all the forty-eight states. They know nothing of anatomy and less of medicine; they have neither degrees nor diplomas; they lack experience in the treatment of disease; more than half of them are dealers in narcotics, and the majority of them make a practice of performing illegal operations on women whenever the fee is attractive enough to induce them to risk themselves in this, the one dangerous spot in their "medical practice." There are in California—the premier state for frauds, charlatans, and fakes in the medical field—more than 200 of these Oriental medicine men. They have not the slightest claim to the right to practice medicine; they are entitled to neither the confidence nor the toleration of the American people; they cure no disease which a five-cent dose of Epsom salts would not have cured, and the medical boards of a number of states estimate that as high as ninety-five per cent of the criminal operations performed by these fakers result in death to the woman involved. These men should not be confused with the legitimate Chinese physicians and surgeons, of whom there are probably one hundred in the United States. These latter either are born in this country, or come here as students from the medical schools established by foreigners in China; they complete the requisite years of study and hospital practice here; they pass the demanded examinations, and the majority of them are as capable, conscientious and honest physicians as any to be found anywhere in the world. They have their own associations in those few large cities in which there are many Chinese; their practice is confined largely to their own race, and they are a unit in aiding the authorities of the several states in running to earth and eliminating the fraudulent Chinese "doctor." They have made important medical discoveries, and there is the utmost accord between them and the legitimate, reputable white physicians and surgeons of their communities. This article does not in any word refer to the small group of Chinese physicians and surgeons, graduates of American medical colleges and universities who are now practicing in this country.



The most prominent streets and the best of business buildings are utilized by the Chinese "doctors" whenever and wherever they can persuade the white owners of these buildings to permit them to enter as tenants. In most instances, the Chinese pay two to three times the rental paid by their white neighbors. This "doctor" had his own drug store and prepared his own "prescriptions" until the medical board of the state in which he operated fell on him.

The 2,000 or more Chinese "quacks," whose practice is confined almost exclusively to white men and women, since the Chinese themselves will not patronize them, come from the ranks of American-born Chinese, almost without exception. Following Rosen's discovery and exploitation of the Chinese saloon porter as the first Oriental "doctor" in America, the notorious "men's specialists" took them up. They installed the Chinese, dressed in flowing golden or crimson robes in sumptuous offices, surrounded them with Oriental mummery, not unlike that affected by the followers of Albert Abrams, and announced that they had brought from the Orient new cures, drawn from the vegetable kingdom, for all the so-called "social diseases."

A Chinese street-corner letter-writer, who became one of the leading Chinese "doctors" in San Francisco. He was financed by one of the faking "men's specialists" who was afterward forced to flee from the city. This Chinese knew no more about medicine or anatomy than he did about aviation, but he made a fortune out of sick Americans.

When the state and Federal authorities began to make our cities too warm for the "men's specialists," these white men, some of whom once had been well-trained physicians and surgeons, either retired, turned into the new field of gland transplantation and medication, or ceased to advertise, thus dropping out of the public eye, and out of the Chinese part of the picture of medical fraud which is being slowly exposed in this country. But it was approximately twelve years after the Jew gambler in Denver started "Oriental medicine" on its way in this country, that the Chinese themselves took over this colossal fraud.

Today, there are few if any white men supporting, or establishing, either financially or otherwise, these Chinese doctors. When the American-born Chinese discovered that a gold mine lay beneath a thin packing of weed-leaves and dried snake-skins, he promptly took his brother Chinese into the game and gently but firmly eliminated the white man. The writer knows of fifteen Chinese organizations—not tongs or companies—which operate a total of about one-half of the Chinese "doctors'" offices in this country. The other half of them are operated by individuals, or by small organizations, owning two or three such offices, all in the same town, all run under different names, and each apparently a hated rival of the others. At least three of the larger organizations operate these medical swindle shops in cities from coast to coast. There is one which has offices in every city from Vancouver to San Diego on the Pacific Coast, with branches in many of the small towns. In fact, it is in the city of 10,000 to 50,000 that the Chinese "doctor" finds his greatest and most profitable field, just as the palmist, the medical metaphysician—if I may be permitted to coin that combination—the soothsayer, the crystal-gazer and other similar frauds thrive best in the smaller communities.

Pretentious offices, comparable with those of reputable American physicians and surgeons, are occupied by these Chinese "doctors," who are seldom if ever patronized by the Chinese, but depend for their clientele on the white people of the community in which they settle.

The larger of these organizations are incorporated, in many instances, as vendors of herbs, imported from the Orient, for sale, as stated in many of their incorporation papers, to members of their own race and to Chinese physicians in this country. It should be said here that the reputable Chinese physicians and surgeons use none of these herbs, nor any other of the weird, outlandish and utterly useless other "prescriptions" handed out to ailing Americans by these "doctors." After the main organization is formed, the offices are opened in the various towns, not in the Chinese sections of those towns, nor even in any foreign quarter, but in the heart of the American business section. In some of the larger cities, notably San Francisco, Denver, Salt Lake City and New York, the headquarters of these Chinese herb companies, as they are technically known, are maintained on the edge of the Chinese colony, because, amid the surroundings of Chinatown, it is easier to throw over the patient the glamour of Oriental mysticism which is a large part of the stock in trade of these pseudo-physicians.

The owners of these larger organizations never masquerade in the rôle of doctors; in fact, they seldom appear at the known headquarters of their organizations. It is almost out of the question to reach them by law, because of the virtual impossibility of identifying an Oriental once he passes the immigration gates to this country. More of the legal aspects of this medical menace will be told later, however. The parent organization of "herb importers," sometimes incorporated, sometimes merely held together by the pledges of the members, establishes its "herbalists" in various parts of the American sections of large cities, and as nearly as possible in the centers of the smaller towns. In the past, these branches were openly maintained as the offices of Chinese "doctors," but of late, since state and Federal authorities have been co-operating to eliminate these impostors, they have dropped the title, and are known as "herbalists," "herb experts," "herb healers," and even as Chinese "drug stores." In no case is it difficult to distinguish to which organization the branch belongs, since the name of the parent outfit is used uniformly throughout the country.

Usually three Chinese, each posing privately as a "doctor," are installed at each branch. Since the individual "doctors" operate in the same way as the branches of the larger organizations, one description will serve for both. Three Chinese, each of whom speaks English, occupy the offices. Occasionally there are only two such "doctors," and, in the larger centers of population, there may be four, but the usual number is three. These men will not speak English to the American "patient," but compel him to carry on conversation with them through an "interpreter."

As soon as the offices are opened, a campaign of advertising is carried on in the newspapers; money is spent wisely among the politicians, and, if possible, among the city officials, especially those who have charge of criminal prosecutions; and the community for miles around

The Sapiro Burr in Oregon's Golden Fleece

Another Chapter on the Exploitation of the American Farmer

By ROBERT MORGAN

SPREAD over the states of Oregon, Washington, Idaho and Northern California lies a warm and golden fleece of wool. In 1923 that fleece weighed nearly fifty million pounds, worth at a low average price of thirty cents a pound, fifteen million dollars. In Oregon, 1,750,000 sheep carried 13,200,000 pounds of this fleece on their backs; in Washington, 550,000 sheep bore 4,300,000 pounds; in Idaho, flocks totaling approximately 2,100,000 presented their owners with nearly 17,000,000 pounds, and in California, 1,775,000 of the "woolies" yielded a clip of 14,200,000 pounds.

In these states a new industry is being built up by the revival of a very old American industry—that of raising sheep for their wool, and the manufacturing of all manner of woolen goods from it. It appears to be, and is, a prosperous and a growing industry. The average annual production of wool in the United States is 300,000,000 pounds, but the consumption of wool and woolen manufactured goods in the United States is 600,000,000 pounds a year. Thus production in this country is only one-half of consumption, and thus also, demand is far greater than supply; that is to say, it requires no effort, no particular business acumen, no salesmanship, and little expense, to *sell* wool. The farmer who has wool for sale, whether he raises fifty or five thousand sheep, has the market brought to him; he does not have to go to the market. These distribution and sales conditions are particularly true west of the Mississippi River, and even more especially true in the Pacific Northwest. They should be remembered, for they have been forgotten by some of the farmers, and thereby the burr of Jewish exploitation has entered the wool industry.

Twenty-six hundred small herds of sheep in Oregon have been bound over by their owners to the California Plan of Marketing (Sapiro) as represented by the "Pacific Co-operative Wool Growers."

This payment of fifteen million dollars a year into the pockets of the farmers and sheep-raisers of four states could not long continue without attracting the attention of the ring which is attempting to exploit the American agriculturist. But it was not until early in 1921 that the Oregon Farm Bureau Federation, urged on by Aaron Sapiro, or agents of that clever gentleman, organized the Pacific Co-operative Wool Growers, with headquarters in Portland.

As in the California Prune and Apricot Association, whose disastrous history—to the fruit-grower—has been told in these columns, the wool-growers were induced to sign away their crops, their futures, their hopes, their prospects, and everything but their land, to the organization. Promises were made to them which have not and cannot be fulfilled; they were told that they would receive prices for their wool which they have not received and never will receive; they were promised costs of "orderly marketing" so low that they have not been approached, and cannot be attained, and, finally, selling power for the entire association, which now has 2,600 members, was vested in one man, R. A. Ward, himself not a wool-producer.

Fortunately, the larger wool-growers—in the same manner as did the larger wheat-producers in the same states—saw through the whole scheme. This organization, with all the power of the Sapiro crowd behind it, never has been able to handle or control more than 1,600,000 pounds of the 50,000,000 pounds of wool produced in the four states. This is to say that the managers, testers, buyers, agents and all the rest of the crowd of salary-drawers live on about three per cent of the wool produced in their territory. With only one-thirtieth of the annual crop under their control, with only some half a million dollars passing through their hands, the followers of Sapiro did not flock to the wool association as they did to other similar associations in the West. The smaller wool-producers, those who had from 50 to 500 sheep, came in; the larger producers, with their hundreds of thousands of sheep on the hills of the four states, remained out, thereby saving the wool industry of the Pacific Northwest, temporarily at least, from the Sapiro system.

Mr. Herman Steen, an untiring singer of the praises of Aaron Sapiro and his schemes, in his book of Sapiro propaganda, "Co-operative Marketing—The Golden Rule of Agriculture," which book is supported by Bernard M. Baruch and Samuel R. Gard, says:

"The chief differences between the Pacific Co-operative Wool Growers and the other western wool-marketing agencies may be expressed thus: (1) It is incorporated; (2) it is based on five-year contracts; (3) it grades the wool and sells it only by grade; (4) it has a sales manager, whose sole business it is to sell its wool, instead of delegating that to a committee or a commission merchant; (5) it has a definite merchandising or orderly marketing policy, as opposed to the organized dumping of most of the others."

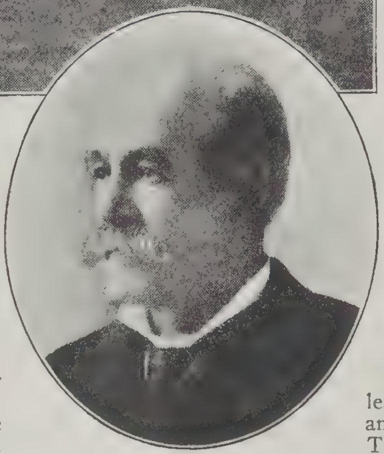
Remembering these statements, let us see how closely to the promises the theory works out:

The first advantage claimed to accrue to the farmer is that of the standard contract. This contract is uniform for all the associations, no matter what the commodity, organized by Sapiro and his associates. It binds no one except the farmer. On it the prune-growers of California, the wheat-producers of Washington, the hay-growers of Washington, the potato men of Colorado, the dairymen of Oregon, have been unable to collect a five-cent piece of *their own money*, received by the association for crops which were the products of their own labor.

This contract in brief binds the grower to turn over his crop, picked when and how the Sapiro system dictates; to take such pay as the association is able to obtain for him; and to refuse to sell one pound of his product outside the association. He is bound for five years to do this. One court in California has had the good judgment to throw this contract to the four winds, but even after this decision, the wool-producers and the wheat-growers and the potato-planters went right on and signed the same contract, except that the words "wool," "wheat" or "potatoes" were substituted for "prunes," according to the association Sapiro was forming.

There is nothing in this contract whereby the farmer who signs it can hold the association or any of its officials, including Sapiro, to market his crop at any fixed cost; to pay him even the current rate which the independent buyer is paying the independent producer; or to pay him at any given date, or within any given time after the product of that farmer's land and labor has been sold. There are men in these associations in the West who today have not been paid for the 1921 crop in full, nor for any part of their 1922 crop, and they cannot collect a cent. The banks, outside one in each large city, usually selected by Sapiro or his agents as a "repository" of the funds of the association of that section, *will not lend the farmer money on association contracts.*

Bankers who, prior to the Sapiro invasion of the northwestern farming communities, would lend the farmers reasonable amounts of money on the prospects of their crops, and, even more largely, on the word of the farmer, today will not lend that same farmer, if he is a member of one of the Sapiro-promoted associations, a dollar.



Thomas Kay

THOMAS KAY

One of the founders of the wool manufacturing industry of Oregon, and grandfather of the men who are leading in the expansion and improvement of the industry there today. Mr. Kay went to Oregon in 1863, and in 1864 became one of the owners of the early woolen mill at Brownsville.

The reason is obvious; no one knows, least of all the farmer, when he is going to be paid for his crop, yet he has to continue every year for five years to deliver that crop to a buyer (the Sapiro association) whose date of payment is never set, and very frequently never arrives.

The writer sat with an Idaho banker recently, when a wheat-grower came in. This wheat-grower leases his land, 2,000 acres, and has been growing wheat in that section for nearly ten years, during all of which time he has been doing his banking with the banker on whom he called.

"John," said the farmer to the banker, "I need a thousand dollars."

"Bill," said the banker, after some intermediate conversation, "have you been paid for your 1922 crop?"

"No, not all of it."

"Been paid for your 1923 crop?"

"No, none of it, but I want to get some money on my 1924 crop."

"What are you going to do with the 1924 crop, Bill?"

"I've got to turn it in to the association."

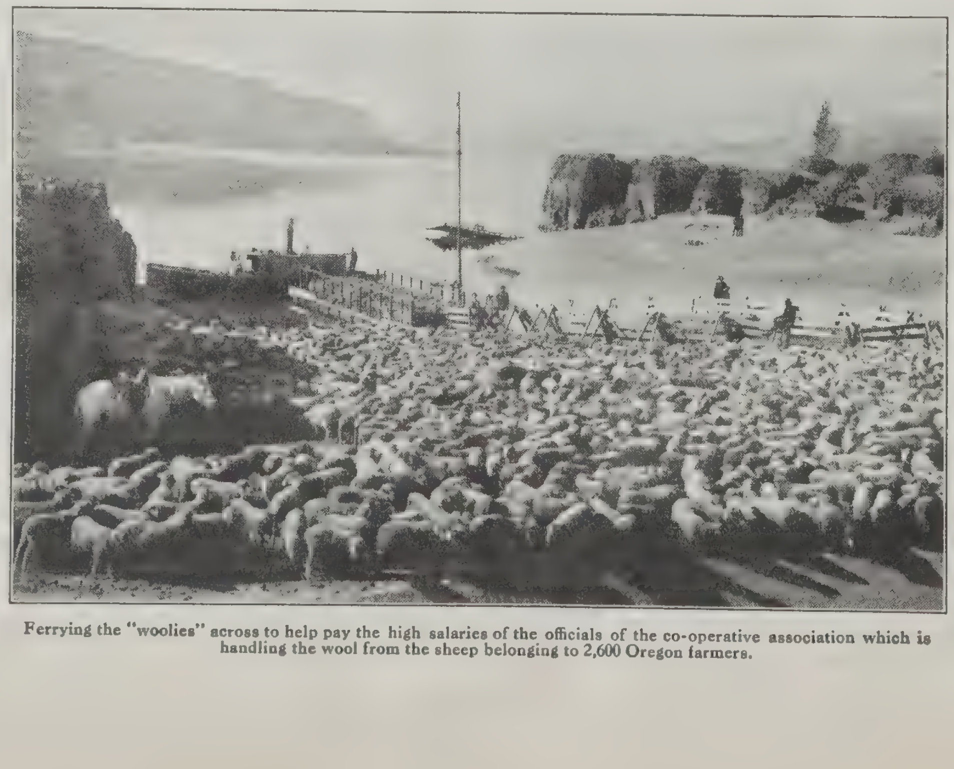
"Well, Bill, I'd like to let you have the money, and I will let you have five hundred dollars of my own money, but not a nickel from the bank."

That's the value of the Sapiro contract to the farmer in that section, and it is just as worthless in fruit, wool, milk, hay, potato or any other associations, as it is in wheat. The "stability" on which Mr. Sapiro and Mr. Steen dilate, as an asset of the association, is a stability which supports only the high-salaried executives of the associations, and binds to them the unfortunate farmers for five long, weary and disastrous years.

The incorporation which Mr. Steen mentions, and which Mr. Sapiro, in his come-on and organization speeches, stresses is an action essential so that the organization, this "co-operative" association, which is to deliver the farmer from all his ills, may go into court and sue that farmer, and collect damages from him, when the farmer refuses to pay further tribute to the Sapiro ring. It is of no value to the farmer, because, under his contract, *he has no legal claim against the association,* no matter what that association does with his goods or his money. The farmer can beat this contract in the courts, but he rarely undertakes to do so, for he fears court action, he fears the imposing legal array of Sapiro, Hatfield & Levy, and so forth, of San Francisco—and it is on this fear that Sapiro preys when the gullibility of his victims fails.

The third thing that Mr. Steen mentions is that the wool association "grades the wool and sells it only by grade." Every manufacturing plant in the woolen industry in the United States—where the demand for raw wool exceeds the supply by 100 per cent—grades the wool and *buys* it by grade. The wool-producer does not have to join an association to have his wool graded; he does not have to sell his wool, nor yet pay a Sapiro-selected sales-manager $5,000 to $10,000, and even $15,000, a year, to sell it for him. The world is waiting for wool. Ice in an American colony on the equator in midsummer never sold with the rapidity with which wool is selling today. As a matter of fact, by actual figures which need not be given here, the wool-growers in the co-operative association in the states under discussion, pay from one to three cents a pound more for the grading and sorting of their wool by the association, than the independent growers pay the independent buyers and factories for the same service. One and one-half cents a pound—a fair average of the excess paid to the association by the farmers for this grading and sorting—on 1,600,000 pounds of wool, the amount handled by the association every year, is $24,000 a year, or about nine dollars for each of the 2,600 members of the Pacific Co-operative Wool Growers. This is not a large sum to each grower, but it furnishes an aggregate which is of interest to the masters of 2,600 American farmers in four northwestern states. Nor is this $24,000 all.

(*Concluded on page 14*)



Ferrying the "woolies" across to help pay the high salaries of the officials of the co-operative association which is handling the wool from the sheep belonging to 2,600 Oregon farmers.

Mr. Ford's Page

IT IS instructive and balancing to consider from time to time what in Congress is called The State of the Union. Of recent years the habit of public thought has turned more and more toward the consideration of piecemeal questions. Programs of "bloc" importance have been the order of the day. Special interests have been pushed through quite regardless of how they fitted the interests of the nation as a whole.

If, to use an old illustration, a man is so set on having a large whistle on his engine that he secures it against all odds, he may discover that his whistle is bigger than his boiler and that he cannot generate steam enough to blow it. That is an example of piecemeal construction, to which modern politics has tended. In Russia, for instance, it became all whistle and no boiler.

So, to look at the state of the whole Union, in all its relations, foreign and domestic, is a profitable exercise in breadth of view. It may be that at the moment, here and there, the equal spread of the benefits of our common life is hindered. When the icemen are busy, the furnacemen are slack; when the farmers are having an uphill pull, the factories may be prosperous; there are always here and there spots where the best of conditions do not always obtain. But, what of the general state of all the people? What of the whole state of the Union?

We may say broadly that the present State of the Union is better than it has ever been before, and that there has been a steady betterment for years. The average, which includes everyone and everything, has been on the upgrade for the past quarter of a century. The general level of all vital conditions has been elevated. Take it wherever you please, in the dignity of personal and domestic life, in the vast increase of family sanitation, in the higher level of public opinion, in the greater and better diffusion of education, in the growth of wealth among all classes, in the enlargement of the plain man's stake in his country, in the growing importance of children, in the greater responsiveness of government to the needs of the people—regard it from whatever angle you choose, you are certain to reach the conclusion, if you have a sufficient background of experience, that the State of the Union is the best it has been in a quarter of a century.

> *NOTHING can stop the United States because it knows where it is going and its progress brings no loss to any worthy thing. Some gains are bought at cost of increased poverty among the people, or degradation of the common life. But American progress has decreased the sum of evil, and is so distributed that it touches every individual and family with its benefits. Sometimes carping criticism had better give way to computation of gain; sometimes we should make a survey of the Whole State of the Union. When we do we see that for a quarter of a century, in any region we may name, the trend of the nation has been steadily upward. The broader view, the combined account, shows every one of us to be profit-sharers in the most successful group experience in human history.*

Lately there has been talk of a slump in business. That is, there has been in some quarters a desire to make talk about a slump in business. The old pioneers driving West made twelve miles a day. (Not that their speed matters, but the fact that they were going somewhere to do something: the centuries wait for such men.) Then was achieved the unheard-of speed of sixteen miles an hour. Today we can cover six or seven hundred miles in twenty-four hours of automobile driving. The point is, we have attained such a speed that slowing down for economic crossings or curves doesn't mean anything. When the limited cuts down from sixty to thirty miles an hour while passing a crowded section, it doesn't mean that the train has stopped or even slumped.

That is about the simplest and truest way of describing what some people desired to herald as a "business slump." The whole State of the Union was excellent. People were working and building and buying. The crops were growing. Mills were grinding. Here and there were slower spots, but even the slow spots catch up when the whole country is moving—and we have seen that most complaining spot, agriculture, come to the front with amazing rapidity before the echo of the latest complaints had died away. It is always the whole State of the Union we have to consider.

In the economic field we are in more wholesome relations with the laws of nature than ever before. We have truer conceptions of what constitutes wealth. We have firmer bases for the material supplies of life. We have sounder views of the connection between Business and Money. The other day a banker said in a speech that "money was the lifeblood of business." It is one of those old sayings whose truth nobody challenges just because it is old and because it sounds wise. Business is the lifeblood of money. Let business stop and see how money stagnates. Let business halt in a moment of doubt or hesitation and see how money flees. No wonder that men of vision have always spoken of "the coward gold." Money takes no risks; it is business that does that. Money creates nothing; it is business and industry that do that. And in Europe the spirit of business has taught the world that business can invent its own money, because money is but the sign of the useful, needful, valuable and true wealth which business and industry create. So that on this score the State of the Union is better than it ever was before.

The position of the Union in international affairs is at the highest point ever attained. Far better than if we had followed the counsel which would make that position merely political. There was a time when to be an American citizen abroad did not mean much to other governments. It was of common repute that if British citizens were the best protected abroad, Americans were the worst protected. Our government was not internationally respected. But we have seen a great and significant change in that respect. The note to Persia indicates that men of strong intention have come into charge. Our words are now being taken as more than words: as the warrant of strong deeds should occasion require. If to have one's quarrel just is to be thrice armed, we have always been thrice armed, but often our government was flouted just the same.

It is no longer so. And why? Because we have shown two qualities which we had all the time but which we were never before called upon to exhibit internationally—power and generosity. This nation has shown its power, in its millions of men and in its unrivaled industrial equipment. It has shown its generosity in a hundred ways to nations which might technically have remained our foes. We have untangled their chaos. We have set their industries afoot again. We have made our nation's name the symbol of powerful fairness in all corners of the world.

And so, without intrigue, without secret treaties, without the dishonest services of false diplomats, without entangling ourselves as partners in the old errors of Europe, we have come to a point of international influence which if not the highest in the world is equal to the highest.

As a people we owe ourselves from time to time this all-round view of our position, if only to curb the carping spirit which thinks that progress is made by kicking. Neither a horse nor a nation makes progress that way. Europe raised whole races of kickers, races which complained for generations and centuries; yet where the spirit of protest has been most incessant, there the least progress has been made.

There is no danger in this country of our falling into complacent self-satisfaction on the one hand, nor into endless fault-finding on the other. When we take account of the State of the Union to date, it does not indicate that we have attained, it only indicates that we are moving and that our direction is right. We have attained no evil thing, but we have left some evil things behind. If what we have gained had been at the cost of greater poverty to the people, or greater degradation of common life, then we might well call a halt. But no such price has been paid. A national progress that enhances and increases the common good elements of life is plainly on the right road.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Rabbi U. S. Minister

THE United States is now having a little trouble with Persia over the murder of a consular officer, and the facts are not all in although the crime is now several weeks old. The press tells us that "Mr. Kornfield, the United States Minister to Persia," has not yet sent in a detailed report.

Mr. Kornfeld, by the way, is worth recalling. His full title is *Rabbi Kornfeld*. He is a Hungarian Jew who came to Columbus, Ohio, in 1907 and was appointed United States Minister to Persia fourteen years later, in 1921. The dates are worth noticing.

Upon arrival at his post his first act was to call together the Jewish community and address them on "anti-Semitism." He pointed out that British public opinion had not stopped the appointment of Rufus Isaacs (Lord Reading) as viceroy of India, and that American anti-Semitism had not hindered his own appointment. With more regard for truth Rabbi Kornfeld might have said that President Harding appointed him almost stealthily and that there was no attempt made to prevent his appointment, and certainly no published protest against it.

But, consider England and India under the Jewish viceroy; consider England and Palestine under the Jewish governor of Palestine; and now consider Persia and the United States whose relations are under the control of Rabbi Kornfeld. Trouble seems to be a natural consequence in all these cases.

Rabbi Kornfeld may be an able man, but the United States insulted the proud Persians when it made them accept a Jewish ambassador. The Persians have their own notions about these matters. And even Americans, in moments of thoughtfulness, might be found considering how it comes that a Hungarian Jew represents our people. What did he want to go to Persia for? Who engineered his selection? Why was he sent?

The list of Mr. Harding's unfortunate appointments is not ended, it seems.

Nothing New

IT IS a trite saying that there is "nothing new under the sun," but from time to time discoveries are made that tend to prove its truth. In fact, instead of being a "discovery" it is often found that the unearthing of some long-buried thing is merely a "rediscovery." This applies to one at least of the numerous archeological finds made near Odessa by Professor Semenov Zusser, a distinguished Russian scientist.

These discoveries consist for the most part of large numbers of ancient Greek tombs of striking design, and among the articles found in the tombs was a small linen bag containing a mirror, a rouge-stick for the lips, and a charcoal pencil for the eyebrows. As the bag was found in a woman's grave with tufts of false hair and a number of silver bracelets, earrings, beads and other jewels, no other conclusion can be come to than that it is the forerunner of what the woman of today calls a "vanity case."

It is often said that the use of cosmetics and other supposed aids to beauty, or at least their excessive use, is peculiar of the modern feminine mind, but here we have the women of more than a thousand years ago resorting to the same artifices.

Looking at it from another angle, it may be that the find in the tomb of the woman of ancient Greece is but a proof that, as frequently asserted, modern woman is not modern at all but is only reverting to the manners and customs of pagan times. The difficulty about this hypothesis is that research has shown there is scarcely a period in the world's history when women did not seek to improve upon nature by the use of some nostrum of the beauty specialist.

However, at certain periods and in various countries, the women mainly relied on the plentiful use of pure water, sunshine and healthful exercise, and there are not a few at the present time who think that the most pleasing and permanent results can be secured by the employment of the same simple means.

A Base Use of Radio

COMMENDATION is due the American Radio Association for swinging its big stick upon certain theatrical interests for a new misuse of radio broadcasting.

The radio association has denounced as unethical an appeal repeatedly broadcast from Station WHN in Loews State Theater Building, 1540 Broadway, for 116 young women "with good figures, pretty faces and neat ankles" to be chorus girls in a new show on Broadway.

"Mr. Schubel denied the appeal was a paid advertisement, but offered no explanation of why the appeal had been permitted for five successive nights." He had been "explaining" how a producer had been granted permission to speak, saying "we are not usually aware of what they will say."

The country has just been digesting the statement of Y. W. C. A. leaders about the pernicious effects of beauty contests, which is another Broadway chorus feeder upon young women. The experiences of many girls who have been attracted to the chorus by this device for culling material has become a national scandal. Now comes this ugly intrusion upon the radio.

France's Recovery

IN SPITE of all her troubles, France is showing a power of recovery from the chaotic industrial conditions following the war that is truly astonishing. In the period covering the first six months of the present year France has, in comparison with the same period of 1923, converted an unfavorable balance of half a billion francs into a favorable balance of two and a half billion francs.

This is an achievement which any country may well regard with satisfaction, and shows what can be done when a sound economic policy is adopted and wisely persisted in. It is characteristic of the French people that in the past they have shown marvelous powers of recovery, even after cataclysmic conditions have overtaken the nation.

The Revolution had no sooner destroyed all that had stood for stability and law and order, than the people started all over again and quickly built up a fresh condition of things that marked the beginning of a new era of prosperity. When at the close of the Franco-Prussian War France lay bleeding at the feet of the newly constituted German empire, crushed by a huge war indemnity and bereft of Alsace-Lorraine, she sprang to her feet, shook the dust from her skirts, and set about organizing the huge industrial exposition that mainly contributed to releasing her of the burden.

In a modified form, history is now repeating itself, and torn and distracted as she was at the close of the World War, France has set her gaze forward and is gradually emerging from the gloom.

Comparing the present French foreign trade with that of before the war on a tonnage basis, it is found that for the first six months of 1924 France imported 6,000,000 tons merchandise more than in the first half of 1913, and exported 3,500,000 tons more. The country is now sending abroad fifty-five per cent more manufactured articles than before the war. Whatever blunders France may have made, or whatever false aspirations she may cherish, it cannot be denied that she is setting her house in order in a manner that is worthy of commendation.

It is too much the custom of nations stricken by years of warfare or by some other disintegrating calamity, to crouch in the dust in a helpless and shell-shocked attitude that invites the commiseration of friends and neighbors, their thoughts buried in the past and the future with no meaning and no hope for them. This mentality spells disaster not only to nations but to individuals. When hope is abandoned, all is lost. But the last gift that remained in Pandora's box has always been treasured in France. It may be that this is why the French have been called a "mercurial" people. In their case, however, the mercury is never allowed to remain very long at the bottom of the tube before there is sufficient energy to send it soaring again.

Mississippi Levee System Completed

THOSE indefatigable workers on behalf of civilization, the United States Army Engineer Corps, announce the Mississippi River is for the first time confined by proved flood-proof levees from Thebes, Illinois, to the Gulf of Mexico.

This ends the efforts to confine the Father of Waters begun in 1717 by De la Tour, the French engineer who laid out the city of New Orleans. He constructed the first levee along the river front.

The original dikes were called "elevees" by the old French inhabitants and this was corrupted into "levees," pronounced "levvies." Dictionaries fail to give this correct derivation, which the army engineers have run down.

The nature and tremendous extent of the problem the army engineers have been grappling with cannot be appreciated until the geological history of the Mississippi delta is considered.

Although the layman thinks of the Mississippi River delta as the present forked termini of the stream in the Gulf of Mexico quite a distance below New Orleans, geologists and engineers have had to deal with the true delta through which the stream meanders under difficult control conditions.

The delta of the Mississippi River started at Thebes, Illinois, above the junction with the Ohio, where the hills of the ancient continent met the Gulf of Mexico which covered much of what is now the central southern states.

As the muddy water poured into the Gulf at that point, sand and silt were deposited, gradually building up the sea bottom to the water level and extending the reach of the river farther south until its present location was made. It is encroaching still farther into the Gulf.

This process of landbuilding resulted in another feature that puzzles the average person. This is the fact that the Mississippi River below Thebes is higher than the adjoining land through which it passes, instead of being in a depression lower than any part of the so-called valley.

However, the people in the Imperial Valley in California will understand this, since the Colorado River, whose delta is analogous to that of the Mississippi, is also much higher than the adjacent country. These rivers flow on top of the "made" land and their mud rims have had to be strengthened by man-made works.

Furthermore, all the mouths of the Mississippi do not branch off far below New Orleans. The Atchafalaya River diverges from the Mississippi River 310 miles upstream from the Gulf. It has a one-third shorter route to the ocean than the main channel past New Orleans and frequently carries the larger volume of water.

Some other mouths of the Mississippi have been cut off from the main channel by dikes across their upper ends. Bayous Lafourche and Manchac are examples of this kind.

Bus Lines Or Not?

WORCESTER and Providence passenger bus lines have just been refused a license by the mayor of Boston to traverse the city's streets. The mayor claims the steam roads deserve "protection" from their upstart competitors.

King Canute commanded the sea to stand still without much more success than can be anticipated in this latest effort to stem progressive motion.

The stagecoach interests obtained some official support of their antagonism to the first railroads. Then the towns that were the junctions of the different gauged short lines bitterly opposed their consolidation into standard gauged systems. They felt it was unfair to create through-travel facilities that would deprive them of their enforced visitors.

Isn't Boston a bit inconsistent in spending public money upon a so-called airport for land and sea planes? Unquestionably the profitable long-haul passenger business and mail revenues of the trunk line railroads will be affected by airplanes. The reasoning of the mayor does not seem to go the whole hog.

Then the passenger boat lines between Boston and New York, Maine and Nova Scotia compete with the same railroad systems that are being "protected" by refusing entrance to the Worcester and Providence bus lines.

However, we fancy that despite the present ukase of the mayor, the Hub will finally be served by passenger motor bus lines.

Putting America's Art Museums to Work

Inspiration Found in Perfections of Artists and Craftsmen of Other Ages

Rodin's "Thinker" impresses a group of East Side youngsters.

By J. OLIN HOWE

WHETHER it be furniture or jewelry, service plates or talcum powder containers, car cards or the covers of advertising booklets, the art values which are giving added distinction to the product of American crafts and industries come mainly from museums of art. There the handiwork of days long gone may be copied or, what is more worthy, works of artists and craftsmen which have lived through the ages inspire the modern designer to fresh triumphs.

Our art museums in this country are no longer given up to the cultured initiate or the merely curious. Their priceless collections are put to practical uses which come home directly to the man in the street.

Imagination reaches across the centuries and an Athenian pyxis fashioned thousands of years ago becomes the long-sought inspiration for the cold cream jar on milady's dressing table. Or men's cravats of richest hue may, and do, owe their beautiful intricacies of pattern to Chinese vases upon which perhaps Confucius gazed.

From knightly armor of old to the modern sports skirt is indeed a far cry, but the American designer has compassed it and adapted for the tennis court and the golf links graven designs worn on the tournament field in the days when knights were bold.

Thus we put our art museums to work. Thus the rich collector shares the treasures his wealth brings together with the humblest artisan. Thus the matchless art of the ancients gives us to make American design more and more worth while as the years pass. We may even be trending toward an American style. At least, one glimpses the possibility of that in the dim distance. And meantime we are gaining a love of beauty and learning to appreciate the expression of it in everyday utilities.

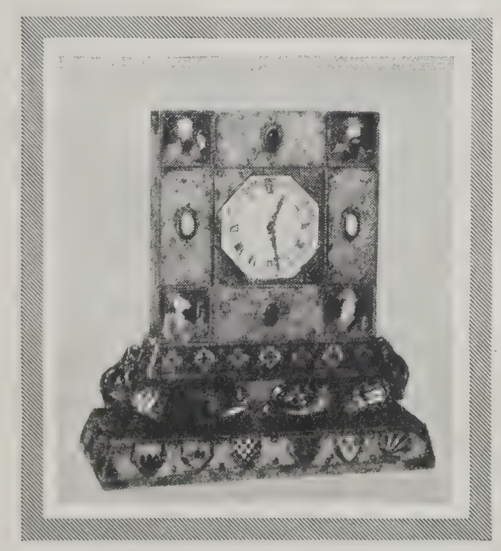
It is not so much that we copy what has stood time's test or, at any rate, that we go no further than that; though true it is that many a designer in industrial art follows the line of least resistance and permits the artist or craftsman of bygone centuries to do his thinking for him. But ever there are those choicer progressive spirits to whom the study of an old piece means inspiration.

Ideas, motives, color combinations spring at such a one from museum pieces of the greatest variety as to purpose, material and artistic background. And very likely the medium in which he works is utterly different from the object which suggests a new and beautiful design.

The museum motif has made its way into American industry to an astonishing extent. In numerous lines of business now a museum group of designs, patterns, styles makes the product noteworthy. From the workshop of far centuries to the clattering modern factory is truly a long road, but a mind alive to the sure principles of art makes little of that. If true values be there, does it matter whether a single specimen is made by hand, or machines turn them out by the thousands?

This New York designer of sports skirt materials, printed silks, sought mental quickening at the Metropolitan Museum of Art. In the collection of armor he found upon a backplate which may well have been worn in the crusades an incised pattern of great beauty. This he took as it was and found splendid for his purpose. And also the manner in which the armor was laced gave him a stitch of which he made good use.

Constantly this sort of thing goes on. Millefleurs tapestries are translated into rugs made in Massachusetts and Italian gesso-covered and painted picture frames into tapestries woven in New Jersey. The transition from old Persian lacquered book covers to gay sports ribbons for Palm Beach wear crosses a wider gap, but as easily.



Limoges enamels, ancient reliquaries and armorial bearings in the Morgan collection at the Metropolitan. Each played their part in the design of this highly ornate clock.

We have printed voiles which owe their dainty patterns to antique Florentine glass bottles and painted furniture made in Connecticut gets symmetry and proportion from oriental pottery. The delicate beauty of line and tracing in Russian laces of other centuries distinguishes American decorated porcelain.

To a casual view phonograph cabinets and Gothic chapels dating back hundreds of years may seem much farther apart than they are to the designer who seeks a spur for his imagination. Then we have wall paper made in Brooklyn whose model was found in ecclesiastical vestments dating from the struggle between Guelph and Ghibelline.

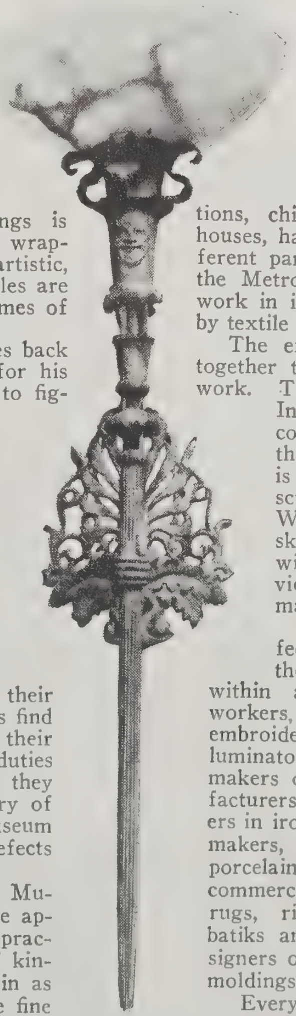
Rhode Island mills weave cotton blankets in patterns which have their origin in rugs of ancient India. And American silver owes no little to Turkish brass produced by artisans of long ago. In French wood carvings is found the inspiration to give us soap wrappers which merit that abused word, artistic, and labels for perfume and other bottles are in designs taken from Egyptian costumes of the day of Rameses.

A graver of chased metals centuries back little dreamed the time would come for his scrolls and curves to be transferred to figured cretonne in the America of the twentieth century. Nor could he who modeled Buddhist statuettes in an Asiatic monastery have imagined his fine figures would distinguish an advertising design many a hundred year later.

Others than manufacturers and designers are concerned in this, moreover; at least, in New York, where groups of department store buyers and salespeople go to the museum for special courses of lectures prepared to inform them about the goods on their shelves. Great merchandising concerns find it decidedly to their advantage to have their employes take time from their store duties to gain first-hand knowledge of what they sell in the light of art and the history of art. In the presence of standard museum pieces they consider the merits and defects of articles from current stock.

The charter of the Metropolitan Museum is a broad one. It includes "the application of arts to manufacture and practical life and advancing knowledge of kindred subjects." The institution goes in as strongly for decorative art as for the fine arts, and decorative art is industrial art.

It even has on its staff a liaison officer who makes the contact between industry and the museum's collections, who goes out into factory and workshop to find ways in which the museum can be of service and who says, "No figurehead is more hollow than the limited conception of the fine arts and never did man devise a more solemnly ridiculous ritual than that used in their worship."



A mirror of ancient Greece is here adapted for an American lighting fixture.

To its officials a museum is worth having only in the degree to which it is useful. It must be a demonstration laboratory. Its highest usefulness is to maintain a standard of design for the industrial arts.

Nor is the Metropolitan Museum alone in such effort. Of the 600 museums in this country about 60 are art museums and each does educational work. But the Metropolitan, which is one of the world's handful of great museums and really a national institution, has led the way.

This is largely due to one man, Henry W. Kent, its secretary, whose modesty would not permit him to take the credit he deserves and who for 17 years has been the genius of its educational department.

The war, or our entrance into it, which shut off European design and threw America on her own resources, gave this its great opportunity. For a dozen years Mr. Kent had been preparing for 1917. The point with him is that a museum whose collections are displayed solely for esthetic enjoyment is not worth the effort.

The phrase, "putting the galleries to work," is his. He acts on the belief that a museum of art, the repository of that work in all the centuries which persists because art is long, should be a living force in the lives of every one of us.

How far he has gone in bringing this about and how far others have followed him is indicated in earlier paragraphs. What American art museums owe this one man would make too long a tale to tell here. He has been curator, inspiration and counsellor of institutions which are doing a vast amount of good in this cultural work, in creating art sense among people generally, in building up an estimate of beauty for its own sake which leads to good taste.

What the New York institution is doing shows what can be done. Annually it holds an exhibition of work of designers and manufacturers which is the outcome of museum study. From a small affair in an obscure gallery, in which no designers exhibited and but 26 lenders with 73 items, this has grown in seven years to demand the largest of the museum's galleries, where scores of exhibitors show hundreds of examples of their skill.

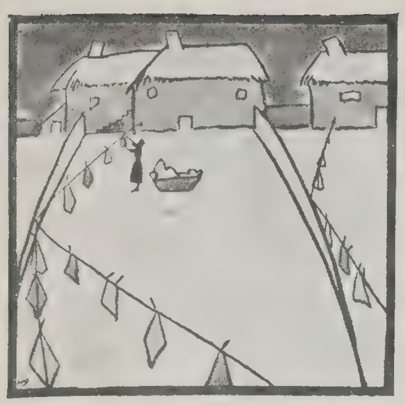
Once or twice the museum pieces copied or from which the idea came have been shown alongside the modern product. Exhibitions of industrial art are now held by a number of American museums, but the Metropolitan is the only one which limits the exhibits to articles whose design was born in the museum.

During one of these exhibitions, chiefs of leading American textile houses, hard-headed business men from different parts of the country, met in one of the Metropolitan's galleries to discuss their work in its relation to what has been done by textile workers in all the ages.

The exhibitions of industrial art bring together the tangible results of educational work. There are many intangible results. In the matter of permits to study or copy museum pieces, of which more than 20,000 were issued in 1922, there is no distinction between artists and sculptors and students and designers. Who wishes to make exact copies, sketches or notes in color or otherwise may do so and a room is provided for storing canvases and other materials.

How varied are the interests affected is indicated by this list of those who have used such permits within a twelvemonth: architects, bead workers, costumers for theaters and operas, embroiderers, makers of stained glass, illuminators, illustrators, interior decorators, makers of gold and silver jewelry, manufacturers of lace and of lamp shades; workers in iron, silver, lacquer and enamel; piano makers, designers of posters, makers of porcelain and pottery, printers, makers of commercial containers; textile workers on rugs, ribbons, silks, cottons, tapestries, batiks and neckwear for both sexes; designers of type, woodworkers on furniture, moldings and picture frames.

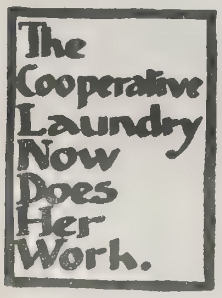
Everything in the galleries has been photographed and these photographs are available to him, or her, who can make use of them. A corps of experts is at the disposal of students.

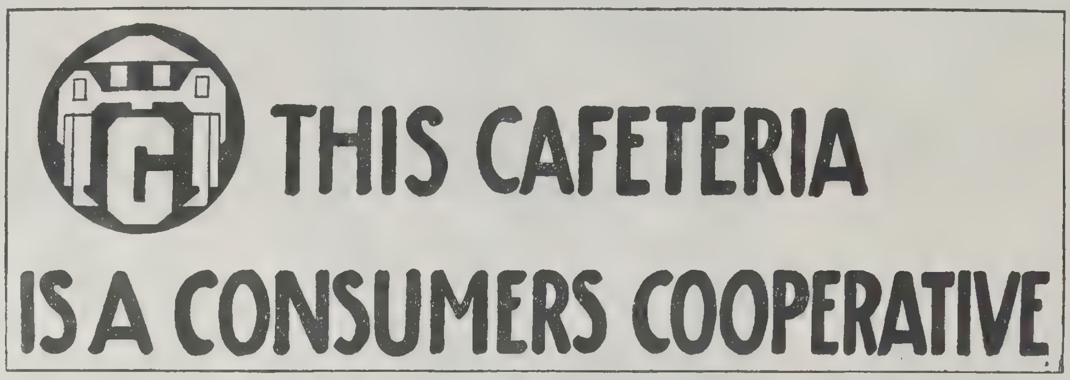


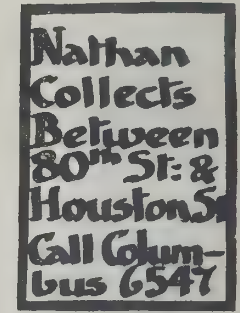
An Experiment in Buying From Yourself

The Healthy Child of Discontent

By MAX BENTLEY



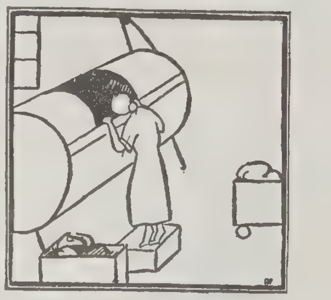




THE brightest spot in the silk district behind Madison Square, New York City, is Our Cafeteria. That statement is to be taken literally. Our Cafeteria used the paint bucket to make itself so. It is, as the name suggests, an eating place. It occupies a one-time private dwelling on East Twenty-fifth street: one of those brownstone fronts which contributed so richly, in days gone by, to the glory that was Gotham, when Gramercy Park was the haughty and high-toned abode of the Very Rich Families. Jewish and Italian silk dealers invaded the district and the wave of trade that followed them turned it into a hutch of twenty-story office buildings and twelve-story apartment houses, and the brownstone fronts have been all but crowded out of the picture.

So, to attract the passing throng, Our Cafeteria advertises itself in colors. The furtive and shrinking violet which was the brownstone front has been Burbanked into a chrysanthemum of many gay hues. It has been adorned with paint—broad bands of red, yellow and sky blue—and the sheer incongruity of it stops the passer-by with a gasp.

It is one thing to draw trade to your door. It is another thing to hold it, to make your first-time patron a regular customer. Paint won't do it, but service and a reason for paint will; and Our Cafeteria gives both. The success of this most interesting business experiment in the Greater City—it is nothing less than that—lies in service, a friendly explanation of "why we are here," and consumers' co-operation. The paint is simply the expression of an ideal that is working.



Our Cafeteria is a link in a chain of four eating houses operated by a group of 1,550 New Yorkers calling themselves Consumers' Co-operative Services, Inc. The cafeterias are owned by the people that patronize them, plus the drop-in trade which is always seeking, in New York, so often in vain, service and good food at fair prices. Last year—the fiscal year ending March 31, 1924—the four cafeterias served 750,000 meals. The drop-in trade contributed the larger part of the revenue, but it is significant that three hundred of this class took out five-dollar memberships and shared in the profits.

No, not profits. Consumers' co-operation knows no such word as profits. The return to the shareholder is nothing more than a limited fixed interest—six per cent—on his share holdings, and a rebate of about the same figure on the patronage that he himself, not others, contributed to the business. In the last fiscal year Our Cafeteria, Inc., (the new name, Consumers' Co-operative Services, Inc., was lately adopted) reported a gross business of $319,000 of which $4,600 was returned as a rebate to those among its 1,550 members who were, by reason of having patronized the enterprise, entitled to a return. Six per cent interest on capital is one thing, six per cent rebate on purchases is another thing. One's capital investment may be only ten dollars, but one's patronage may be $250. The idea behind Consumers' Co-operative Services, Inc., is to attempt to organize the purchasing power of the masses by voluntary pooling, rather than to enlist their capital. "For Use, Not For Profit," is the slogan.

The noteworthy thing about the success of Consumers' Co-operative Services, Inc., is the grouping into a cohesive *buying* unit of so-called hundred per cent Americans of the middle class: the clerks, office workers and professional men and women. This class has been notoriously weak in organization. They have been the shining marks among New York's million or so unorganized suckers. Our Cafeteria is consequently pioneering with a new group.

The New York experiment has a broad background to draw on. Consumers' co-operatives—group buying—date back to 1769. After every war, with its aftermath of inflation and economic pressure on the ill-to-do, the movement has accelerated enormously. It is a fantastic thought, that this healthy and normal and growing child sprang from the seeds of discontent.

The fathers of consumers' co-operation were the "poor weavers of Scotland" who, in the year 1769, formed a society for the pool purchase of "necessar victwals"—so ran the crude agreement of whose eleven parties thereto three signed with "X his mark." The next recorded experiment was at Hull, England, in 1795, when "We, the poor inhabitants of the said town," bound themselves to a group purchase of flour. In 1843, the famed twenty-eight weavers of Rochdale, in the north of England, subscribed a pound apiece in weekly installments of a few pennies until they had enough to open the famous Toad Lane co-operative store.

The then-revolutionary plan of the Rochdale weavers was to sell at regular market prices; divide the net earnings quarterly among the purchasing members, to each in proportion to the amount of his purchases, in the form of rebates; to pay only a fixed small rate of interest on the capital itself; and to give one member one vote irrespective of the amount of stock he had subscribed. Those four principles made the venture highly successful, and became the foundation of the now world-wide consumers' co-operative movement. It is precisely the plan followed by Consumers' Co-operative Services, Inc., of New York.

The movement had reached practically all countries of Europe before it was felt appreciably in the United States. In the same year that the Rochdale weavers opened their Toad Lane store, a Boston tailor started the first co-operative store in America, but the curious fact is that the land of the free, usually so ready to "take on" anything new, to "give the once-over" to any sporting proposition, has been tardiest among the nations of the world in developing consumers' co-operation. England, on the other hand, has been a leader. At the end of the first six months of the European War, the English co-operatives had a membership of 176,750, with a gross retail trade of $692,360,000.

New York City gave it a trial first in 1907. The Middle West and West took it on enthusiastically and hundreds of societies are flourishing out there today. The labor and foreign groups have usually managed to make it pay; it is the home-grown professional and clerk class which has been disposed to pass it by. And this is the class the founders of Our Cafeteria, Inc., had in mind trying to reach when they organized.

In October, 1919, Miss Mary Ellicott Arnold and Miss Mabel Reed took the first step. They were New York women thoroughly sold to consumers' co-operation but without restaurant experience. Their resources were small, and to do any sort of going business they needed a quick turnover. So they opened a restaurant—called it Our Cafeteria—as a private venture but with a determination to devote the net returns, if returns there should be, to public service. And they so informed a group of friends the night before they opened the place on East Twenty-fifth street.

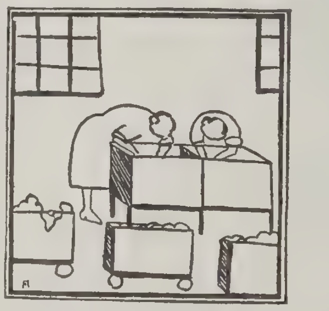
The venture boomed from the start. Besides revealing a quite uncanny estimate of what it took to satisfy the needs of the inner man, they learned how to advertise with point. Saying it piquantly, sending out gay little messages to their friends, brought substantial returns. After several months of successful experimentation with their ideal they made the project co-operative. A two-week stock-selling campaign was launched; the goal was $1,000 in five-dollar shares. They actually took in $2,100.

Incorporation was the next step, under New York's law on co-operatives limiting dividends on capital to six per cent and setting up the principle of one member, one vote. The authorized capital stock was $4,400. It was increased a year later to $50,000 and is now one-half subscribed. The share holding of one member was limited to five per cent of the amount of stock outstanding at the time of purchase. In April, 1920, Our Cafeteria, Inc., operated and owned by its members, was ready to start growing in the face of an already well-developed financial windstorm.

Sixty-six shareholders went into the corporation. Did it pay? The tabulated returns speak for themselves. (Figures given in round numbers only.)

April to April	Membership	Total Business	Net Earnings	Rebate	Outstanding Stock
1920-21	380	$ 96,000	$ 6,000	$1,800	$ 5,000
1921-22	750	190,000	12,500	2,750	10,000
1922-23	1,240	317,000	24,000	5,000	17,000
1923-24	1,550	319,000	20,000	4,600	24,000

Three more cafeterias have been opened. The locations were carefully selected. A brownstone front was found on Irving Place near enough to the residential neighborhood around Gramercy Park to attract a substantial night group for the evening meals. It was named Our Cafeteria No. 2. The third link in the chain was opened in a house adjoining the Curb Market in the edge of the financial district. No. 4, the baby of the family, took over the basement of the building vacated by the composing room staff of an absorbed New York morning newspaper, facing Park Row.



Each place carries the familiar hall marks: paint in fast colors and the quaintly-drawn welcome signs. Each is staffed by affable missionaries in the food-purveying line: affable because nearly every worker is a fellow-owner and fellow-sharer of the net return; affable because that sort of co-operation, besides being profitable, is a self-respect builder. It has made the *esprit de corps* not simply good, but perfect.

The printed material strikes a note that is positively jovial. "The Co-operative Crier" is the intermittently-published house organ. From a recent issue:

"Hear yez! Hear yez!

"With attention to what the Crier sayeth!

"For whom will you vote to go on to the Board of Directors? Why should you vote at all for that matter? You don't know anyone! And it's not your business anyhow!

"But that's the point. It is your business. It is an industry owned by those it serves. It depends for its safety on board and management jointly. Your big job is electing the Board."

The candidates for the board—five new members to be chosen—are then introduced. The staff artist presents them in quaint fashion: eight ridiculously drawn characters sitting around a sketchy table, representing men. The table is merely an elliptical flourish with two horizontal marks for legs. Then they are re-introduced photographically: a portrait of each and a complete biography, with special emphasis laid on technical training and co-operative experience. As a gentle nudge of what is expected from the incoming board in attention to business, the Crier turns the light on the old board with this significant chart:

	Armes	attended	17	out of	20	meetings.
a	Arnold	"	20	" "	20	"
b	Barnes	"	20	" "	20	"
c	Chase	"	9	" "	16	"
	Chenery	"	12	" "	20	"
	Collier	"	14	" "	20	"

Steal a Million and Become Respectable

Bobbed-Haired Bandit's Crime Versus That of Bucket Shop Keeper: A Striking Study in the Administration of Our Criminal Laws

By PETER SCHUYLER

ABOUT three months ago a girl scarcely out of her teens, whose only mark of identification was her bobbed hair, committed a series of brazen holdups in Brooklyn and Manhattan. The newspapers attracted attention to the crimes by labeling the perpetrator, "The Bobbed-Haired-Bandit." For weeks small shopkeepers in the City of Homes were panic-stricken every time the door of their establishments opened. The police and detective forces of Manhattan were successively perplexed, annoyed, and angered by their inability to lay hands upon the bold buccaneeress of Brooklyn. Bobbed hair was no easy clue to follow in this day of clipped tresses, but the press spared no sympathy in riding the guardians of the city's safety for their failure to apprehend the robber.

But all things have an end and the law of percentage eventually "turned up" Celia Cooney and her husband, the assistant in her illegal financial operations. The pair was arrested in Florida whither they had fled and where they became penniless. With a grand fanfare the dailies heralded the arrest. The progress of the offenders North was chronicled with faithfulness worthy of a better cause. Celia was interviewed by special "lady" correspondents every time her train halted to let the engine take on water. Even the intimate details of her bedraggled finery were played up at length. She was the "human interest" find of the moment and a front-page sensation.

Her trial, which was swift and unsentimental, disclosed that, instead of being a robber of romantic quality, she was a typical product of Manhattan's slums. She was born in degradation, reared in neglect and viciousness, turned loose on the streets of the waterfront at an appallingly early age, and the law of momentum did the rest. The need of money to buy cheap finery and a craving for ease prompted the robberies which she and her husband, a mental defective, committed. They took a chance and got caught. Manhattan, outraged in its sense of nightly security, demanded a victim. Justice had to be satisfied. The Crimes of the Cooneys had to be expiated and their punishment made stiff enough to deter prospective criminals. The Majesty of the Law had to be upheld.

To Auburn for Twenty Years

SO CELIA COONEY, who had offered no plea of adverse circumstance in her upbringing as grounds for clemency, was ordered confined to the limits of Auburn Prison from TEN to TWENTY YEARS. The gross amount stolen by Celia, the friendless street rat, and her mentally deficient husband, was LESS THAN ONE THOUSAND DOLLARS.

* * *

In September, 1923, the firm of Jules C. Rabiner failed for upward of $800,000. The sign over Mr. Rabiner's door announced that he was a broker. As a matter of fact he was a bucket shop keeper which means he ran a place where innocent financial sheep are skinned to the bone. But Mr. Rabiner's failure was the essence of discreetness. There was no newspaper outcry about it. The case had none of the "color" of the exploits of Celia Cooney and it received not an iota as much space. The district attorney who investigated the "failure" found out that Mr. Jules Rabiner had bucketed many of his customers' orders. But Mr. Rabiner promised to make restitution. He would do the right thing, and so forth.

He failed, however, to keep his promise and was arrested for stealing securities amounting to $3,600 from Thomas Millen, one of his victims. He paid $1.100 in restitution to Millen and then stopped.

His second arrest followed and he pleaded guilty. In addition to his gifts as a swindler Mr. Jules Rabiner must have had something of the clairvoyant in his make-up. He must have known what was going to happen to him in the future—part way at least.

But he begged the court for mercy just the same.

"I am involved in a big transaction from which I *expect* big returns *probably* in June," he said. "I *may* then be in a position to turn over to the trustees in bankruptcy sufficient money so that good dividends *may* be paid *if* I am given the opportunity."

His counsel, Jacob Goldstein, who had won *two postponements* of the case and the release of his client under $10,000 bail, also pleaded for clemency.

But in spite of Rabiner's speech from the dock, which reads like a come-on letter sent to a "sucker," Judge McIntyre, presiding at the trial, retained his composure.

"I don't like the looks of this case at all," he said. "There has been too much scandal connected with it and too much talk about it in the corridors of the Criminal Courts building. This man's firm operated bucket shops which were dens of thievery. Pitiable stories have been told me by customers. Some of them, widows, lost all they had."

Disposing of the prisoner and his lawyer's pleadings for mercy, the court further said:

"Hundreds have interceded for Rabiner and have even invaded my home and office."

Jules C. Rabiner was then sentenced to spend in the penitentiary on Welfare Island which is *a ten-minute ferry ride from the heart of Manhattan*, FROM SIX MONTHS TO THREE YEARS. The New York *Times* winds up its story of the trial with these pitiable words: "Rabiner was then led away to his cell in the Tombs. He will be taken to the penitentiary on Welfare Island this morning."

The Majesty of the Law was upheld. The demands of Justice were satisfied. Jules C. Rabiner who "failed" FOR ALMOST A MILLION DOLLARS pays the penalty for his crime against Society. On Welfare Island, ten minutes from the heart of Manhattan he will spend from six months to three years.

BUT DID HE?

* * *

On April 25, 1924, less than ninety days after he began his sentence of expiation, Jules C. Rabiner who "failed" for almost a million dollars and thereby largely cheated the widow and the orphan, was released from Welfare Island by the Parole Commission upon his promise to pay in monthly installments of $100 the sum which was still coming to his victim, Millen.

Such an exercise of credulity on the part of the Parole Commission raised an uproar that reached the august ears of Mayor Hylan, "friend of the peepul and foe of the interests."

Forthwith His Honor ordered Commissioner of Accounts David Hirshfield to "investigate" Rabiner's parole.

Mr. Hirshfield has been accused of starting during his term of office over twelve thousand investigations and making findings on two of them.

But he is always ready for just one more. He went at the Rabiner parole like a terrier to a rat hole.

Four witnesses, Dr. Edward Spitzer, who lost about $13.000 in the Rabiner failure, Dr. Spitzer's wife, and two friends of Dr. Spitzer and Dr. Spitzer's wife, namely Mrs. Bertha Shack and Louis Blumenthal, swore that they had seen Rabiner in a Childs restaurant on upper Broadway February 7, TWO WEEKS AFTER HE WAS SUPPOSED TO HAVE BEGUN HIS SENTENCE ON WELFARE ISLAND.

That testimony brought out the fact that Judge McIntyre, who had sentenced the bucketeer, had issued a writ permitting Rabiner to remain in the Tombs until February 8, and to be absent in the custody of the sheriff from that institution daily between the hours of ten in the morning and four in the afternoon, that he might wind up his business before being parked in the Welfare Island penitentiary.

But the Spitzers swore they saw Rabiner with other people in other restaurants on two other occasions after the February 7 incident. Once they said the meeting took place around midnight.

This statement of the Spitzers was rebutted by the guest they said they saw with Rabiner. He swore that he could not have been with Rabiner on the occasion specified because he was a sick man and had been forbidden to eat anything at midnight!! Dr. Spitzer, having lost $13,000 in Rabiner's bucket shop, insisted that he was familiar enough with the thief's face to identify it in any restaurant at any hour of the day or night.

The warden of the Welfare Island penitentiary and his attendants swore that Rabiner had never been away from their bailiwick from the hour he began his sentence until he was paroled.

Three Months as a Clerk

BUT they did give some illuminating testimony.

Rabiner, while in the prison supposedly suffering punishment for his crime, *was actually serving AS SECRETARY TO THE PAROLE COMMISSION; he assisted in the* examination of other prisoners seeking parole; he never wore the prison uniform, the prison shoes, nor the prison shirts; HE TOOK ALL HIS MEALS WITH THE CIVILIAN CLERKS; the guard in the room where he was "imprisoned" was so deaf he could not hear the telephone which Rabiner had within reach if he wanted to transact business in Manhattan by that means.

Among the special pleaders for Rabiner's release by the Parole Commission were I. W. Halperin, a probation officer who found out that after Rabiner's indictment and while he was awaiting sentence he had worked on a commission basis for a Wall Street firm.

Another intercessor was Mrs. Gussie Myers of the Jewish Probation Society who admitted she was a friend of Rabiner's family and had not told the Parole Commission anything about Rabiner's bucket shop activities when she was asked because "he was so charitable." Mrs. Myers also admitted that she had gone to Millen's attorney and suggested he write to the Parole Commission interceding for the "so charitable" thief. Two fellow convicts of Rabiner's told Commissioner Hirshfield that the accused could not have been away from the island as the whole place would have known about any favors he received.

One of them, a first offender, who had stolen THREE DOLLARS will be paroled after he has served TEN MONTHS.

Rabiner, who confessed he had stolen THREE THOUSAND SIX HUNDRED DOLLARS, was paroled before he had served NINETY DAYS.

The other convict HAD ALREADY SERVED NINETEEN MONTHS OF A TWENTY-TWO MONTHS' SENTENCE for passing a bad check for TWELVE DOLLARS AND FIFTY CENTS. He had made restitution for the check BEFORE HE WAS ARRESTED but as it was a third offense on the same grounds he had to be made an example of! Rabiner "failed" for EIGHT HUNDRED THOUSAND DOLLARS and spent LESS THAN THREE MONTHS IN JAIL AS A CLERK!

As soon as Mayor Hylan learned the facts about the parole he ordered it canceled at once and Rabiner returned to Welfare Island. But Rabiner's lawyer got a writ of habeas corpus preventing his "re-incarceration." Once more the pleas for clemency rent the judicial heavens. This time the pleaders included the cashier of a Fifth Avenue bank, William D. Wolfert, secretary of the Daughters of Jacob, and Rabiner's physician, Dr. Jacob Glass. However, Justice McCook vacated the habeas corpus writ and Rabiner has taken an appeal. If he loses he will then go back to Welfare Island, a ten-minute ferry ride from the heart of Manhattan.

Judge McIntyre has been quoted as declaring he should spend at least two years there. Perhaps he will!

An Experiment in Buying From Yourself

Concluded from page 10

next friend verbally to reinforce his aspirations with a fuller description of his technical talents toward the management of a weighty undertaking like a co-operatively-owned cafeteria chain.

Miss Mary Ellicott Arnold still presides, now as the general manager, over this interesting experiment. From her office in Our Cafeteria in Irving Place she directs the activities of more than one hundred enthusiastic salaried owners-workers. Her staff has been lately augmented with the taking over of another enterprise, the former Village Laundry, now Our Laundry. It was co-operative, too, chartered as such by the little group of Greenwich Village housewives who organized it in 1920. The unique reason for its absorption by Consumers' Co-operative Services, Inc., was the growth of its business. It grew so rapidly that very soon the part-time volunteers who had brought it forth found it too big to handle. So it was absorbed—charter, machinery, liabilities and assets, goodwill, Nathan and all. Nathan is the Negro delivery man who writes friendly poems to his patrons on the theme of co-operation in having the wash ready, and who, when the bundle is not waiting, leaves this plaintive printed note: "I have been here for your wash, but couldn't find it. What shall I do now?"

The purpose back of Our Cafeteria is, says General Manager Arnold, to seek a form of industrial organization better than the present competitive one where individual profits are the main incentive to enterprise, and to try it on the poorly-organized middle American class. Her idea of a natural incentive is to set paramount value on one's patronage of one's own business. Non-member patrons, she explained, do not share in rebates, and members do not receive returns on non-members' patronage; their return being only on their own patronage.

A consumers' co-operative, she goes on to say, is like an ordinary business in the emphasis it puts on operating efficiency. Like any enterprise, its existence depends upon the service it gives to the public, as compared with the service given by private concerns in cost and quality. After setting up the principle that no profits are to be made, it fixes its prices at market rates. The average noon meal check in any of the four cafeterias is forty-seven cents; for the night meal, sixty cents. That is substantially in line with New York's prevailing cafeteria prices. The reason given is that it is impossible to budget in advance the exact cost of running a business. Our Cafeteria prices are therefore set somewhat higher than the probable costs; later, when the exact cost is known, the extra amount collected is returned to each member customer, as a rebate. The board of directors follows the operating cost to the last dime. Month by month the income, and every major item of expense, are examined in great detail and reported back to the membership: why fewer people ate in December and February, why the raw food cost fluctuated two per cent, what articles of food were in principal demand.

The membership at large is constantly urged to participate in the business sessions. "To have them know every detail of the business is our aim," says Miss Arnold, "because it is their business. You see, we have an idea to sell as well as goods. We are trying to sell the idea of skilled leadership answerable to the mass, the idea that group purchasing power *is* a power."

Consumers' co-operation, she added, as it induces the spirit of fellowship and substitutes mutual aid for wasteful competition, is but an expression of a true economic and social democracy.

New York's Stately Homes Quickly Vanishing

Business Progress Sweeping Away Mansions That Cost Millions

By A. R. PINCI

ALL sorts of things vanish in this world, but of the more permanent forms nothing is vanishing so fast as New York homes. The cause? Three-fifths of it is speculation; one-fifth is carelessness or indifference; the remaining fifth accounts for the victims of the so-called high cost of real estate.

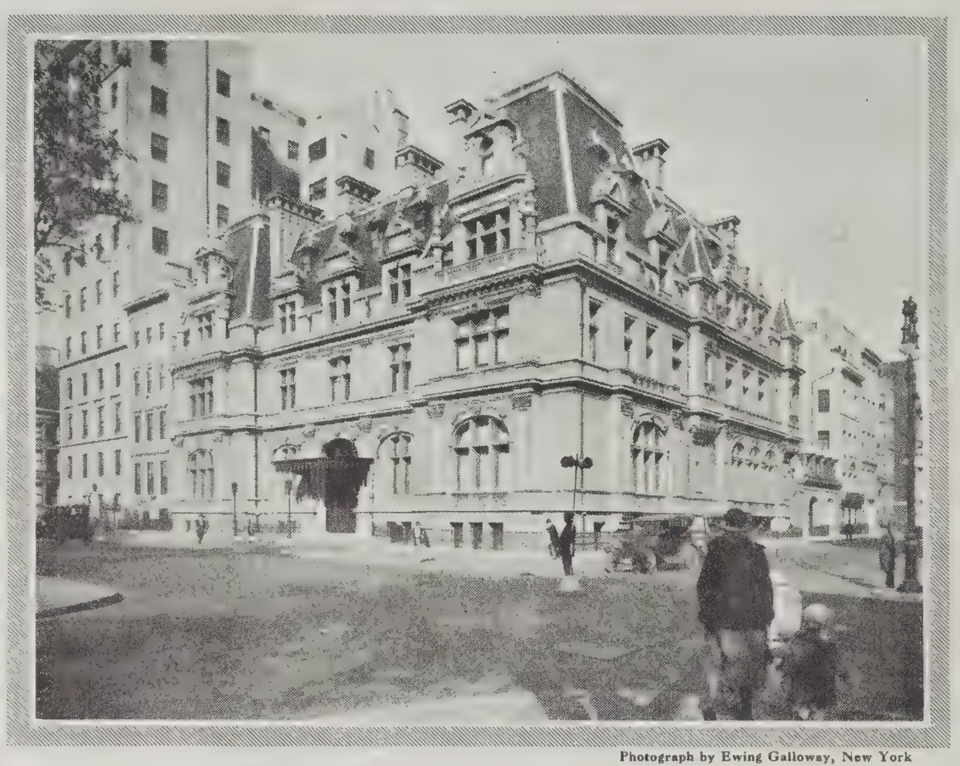
If one were to believe the highly glazed booklets and the exaggerated advertisements of real estate vendors, there is no longer obtainable an habitable foot of space in the metropolis. Yet New York abounds with empty spaces. As one rides on the Second or Ninth avenue elevated trains, one sees the dirty windowpanes, the exposed woodwork of doors and casements whose paint became dust eons ago, the crumbling brick walls, the stained "To Let" signs which still bravely and brazenly do their duty day in and year out.

It is perfectly good real estate all along these lateral thoroughfares, but absentee landlordism, estate exigencies, and unadorned fraud together operate to create an artificial scarcity of accommodations. If the dishonest increment of values of the inner city were spread to to these now forsaken neighborhoods, not only the municipality would gain, but fewer pestholes for criminals would exist, and the city would serve the compliments which are now directed at selected quarters and nothing more.

One hears a great deal abroad about the Great White Way, but no one hears anything about districts, culs-de-sac, wards and the like, which the spinal "growth" of New York invites and fosters. Every time a former downtown residential block is depleted because its denizens migrate uptown in the new co-operative apartments, New York loses. Apparently it is a gain, because on the assessment books values are jotted down with an ease and extravagance that would make the John Laws of old blush with rage. This "wealth" makes excellent reading in newspapers, but only superficially.

The true side of the story is revealed by the number of families who are starving on food and starving in soul to pay the rentals for the only living quarters to be found within reach. If the thousand of old and long since abandoned lofts, houses given over to dubious tenancies, and other quarters wholly uninhabited, were torn down to make way for new apartments, the shortage existing today would not exist.

Not that there are not honest realty experts and operators and builders. In fact, they are many, but they labor at a disadvantage. There are historic firms, whose names on a sale or rent sign means something, not unlike a bank certification on a check, but these have been obliged virtually to withdraw from the smaller operations. Overhead and competition forced them to handle only operations of magnitude and that lets the little fellow out. The man who wants to spend $100 a month rent or less has no chance.



Photograph by Ewing Galloway, New York
Astor mansion, 65th street and Fifth Avenue, New York, now occupied by Vincent Astor.

But let's trace the causes. The courts have been invoked to decide what was to become of the restricted neighborhood along Madison avenue of which the J. P. Morgan house is the hub. The only thing that has served to maintain that a residential neighborhood is not the court's decision so much as the fact that a prominent American family, and a rather cohesive group, are inhabiting it. If tomorrow the Morgans moved elsewhere the neighborhood would be doomed.

At Fifty-seventh street and Fifth Avenue the Vanderbilt residence, misnamed a chateau, has so far resisted business encroachments, but it is a matter of price. Meanwhile the city, through condemnation proceedings, has amputated that home of its protective lawn both on Fifth Avenue and on Fifty-seventh street. It is now flush with the building line except on the north. For residential purposes, however, what with the noises of traffic, the smoky atmosphere and the congestion either way when traffic is closed on the other, it compares with many humble tenement districts.

That the residence will soon go is an accepted fact. Other residences, hitherto considered impregnable, are going. The latest announcement is that the John Jacob Astor mansion will be replaced with co-operative apartments. The Hamilton Fish residence will suffer the same fate. That the Gerry mansion will not last long is forecast. The Stuyvesant Fish residence, famed in the social annals of a generation ago, has suffered its furnishings to go on the auction block and now is for sale or lease, desirable "for business purposes."

One asks: "Why?"

When $50,000 a year rental is spent by a New York family, which can afford a home, for an apartment which rises over a network of railroad tracks, as is the case in the Forties at Park avenue, it is time for sociologists to take a hand in analyzing the mystery. True, the tracks are not seen for a few blocks, but the noises below are railroad noises, and on the whole these denizens of supposedly fashionable buildings are little better off than the humble residents of homes abutting the railroad yard terminal of the average city and town. And farther out, north of Fiftieth street from the upper floors of apartments which cost $15,000 to $25,000—that is the annual rental of many—there is a beautiful vista of trains, about one every seventy seconds, from the Twentieth Century and the Wolverine to the suburban coach trains that make men sweat for their fresh air.

For this and sundry similar privileges New Yorkers have abandoned beautiful homes ten to thirty blocks away. The god of Fashion is thus appeased. A "park" avenue address is supposed to be the thing, even though it is a grassplot laid there to conceal a railroad that will not stay concealed.

But is that the story? Not all of it. One would not believe it, but a cursory inspection of the ash cans at the service exits—which a pedestrian cannot avoid, since they decorate at certain hours these exclusive sidewalks just as is the case at Avenue A—reveals a full quota of ten-cent soup cans, tin boxes that were the last habitat of fish often called sardines, and all the other package debris that is supposed to be associated with kitchenettes, gas-jet stoves, hurry and economy. The purchase of these foods is a story in itself, the details of which have been imparted to me by the managers of chain groceries and fancy shops after diligent inquiry and perhaps some persistent inquisitiveness on my part.

Early last April the newspapers devoted many columns to the announcement of the demolition of the Astor residence, together with brands of history made by the grandmother of the present occupant. As usual, the cause was stated as economy, or rather, the heavy overhead of maintenance. It was stated at the same time that Vincent Astor's present fortune, all in gilt-edge real estate, is $85,000,000. More than half of that consists of centrally located property which brings in the highest rental on record. Thus, even though the house is seldom used by its present owner, his income is more than ample to maintain one of the most beautiful

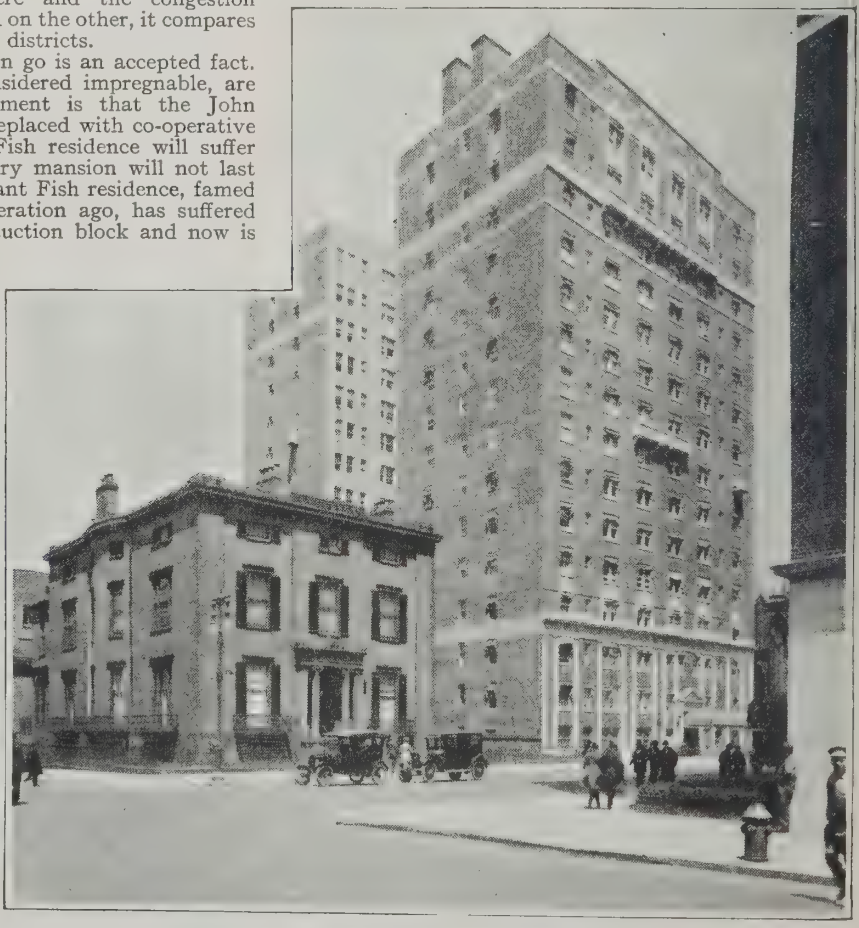
Famous Vanderbilt mansion, which faces on the Plaza and runs back to 57th street, on Fifth Avenue. The Heckscher Building, new cut-back architecture, on the southwest corner of Fifth Avenue and 57th street.



The old Brevoort mansion, Ninth street and Fifth Avenue, New York. Beyond is a big apartment house which has taken the site of the old Eno house.

Photographs by Ewing Galloway, New York

Above, left—Famous Fifth Avenue homes, north from 51st street: W. H. Vanderbilt house (left), W. D. Sloane place, Elliott and Shepard, W. K. Vanderbilt (next to church). Above, right—The J. P. Morgan residence at 36th and Madison avenue, with famous Morgan Library and Art Gallery in the rear. The late J. P. Morgan built the place. The son has it now. Below—The Gould house, 579 Fifth Avenue, now occupied by Mrs, Finley J. Shepard (Helen Gould) and her husband. At the 47th street corner, one of the most valuable pieces of ground in New York.

homes in America, which if nothing else ought to remain a monument to a family that has helped make New York history in its truest sense. There are certainly enough vacant plots on Fifth Avenue, and others surmounted by relatively cheap and unknown houses, which should first feel the jaws of Marion steam shovels and the echoes of riveting machines.

But the destructive fever is on. Buildings in centrally located spheres are being torn down, forcing many tenants mercilessly out, and they are being torn down ten and even thirty years before their structural usefulness has passed.

Every time a vacancy occurs in some of the old family homes along that most susceptible quarter, from Fiftieth to One Hundreth streets, from Lexington avenue to Fifth Avenue, one wonders what must have happened to alienate so many families from homes that though built twenty-five or fifty years ago are better in general than those put up today by commission-mad speculators. Personal circumstances may force changes in some cases; economic readjustments requiring economy may be responsible for others; but what of the rest? Are they sacrificing homes just for the dollars?

Is that what drives so many people to the hotels? For the hotels, especially those rated as non-commercial, are veritable hives of homeless people who have nothing but money. Hotels now figure as prominently in the social columns as do the individual hosts; sometimes more. The name of the hotel establishes a sort of social degree, and fashionableness is measured by the exclusiveness of its clientele. But no matter how exclusive, it is always a public place. It is never home.

And hotels change in this wise. The hotel that was the cynosure of attention ten years ago is forgotten today. In the same measure it is expected that the fashionable hotel of today will be unknown a dozen years hence.

What's the answer? None knows.

City officials are, nevertheless, disturbed by the general situation, even though they have paid no attention to the upper structure of the well-to-do and the rich and have dealt exclusively with the poor and the white-collared class. They predicate their analyses upon the wants and needs of these two classes, which are constantly added to by sinister realty speculation. The "operator" who in less than five years makes from $50,000 to $500,000 by using a shoestring capital and cleverly using his signature in options and "deals" does not worry, because he can retire, but the pity is that he considers himself one of the solid citizens of the community, "*one of its builders!*" In reality he undermines.

The New Yorker has heard so often the refrain that New York City belongs to the rich from other cities who gravitate hither to imbibe culture and refinement, that he actually believes it. He regards it a business proposition, pure and simple, and is not concerned, he imagines, with the human aspects of the problem. What is the result?

The line of demarcation between residents here is unmistakable. Brooklyn still retains the fame of being a city of baby carriages and churches, which is not empty fame for any community, and nearby Jersey towns and Staten Island are still good bulwarks of solid medium citizenship. But New York City has lost its heritage of homes

---

Fight for Prohibition Proceeds in Scotland

Concluded from page 2

G. K. Chesterton spoke at a big meeting called in the interest of "Moderation." Both expatiated on the virtue of "moderation in all things," and had some cutting things to say about "intemperate temperance reformers." Education rather than legislation, they insisted, was the only solution of the drink problem. Chesterton was particularly witty in his picturing of a nation depriving itself of the geniality and joy of a "foaming tankard" or a "friendly glass," and of a misguided band of lugubrious reformers bending their saturnine energies to killing all the joy out of life. So far as I can see, nobody takes this third movement seriously. There are suspicions, indeed, that it receives encouragement, if not financial aid, from the *Trade*. The old imperial dictum, "Divide and rule," seems to be in favor at "No Change" headquarters.

Since coming to Edinburgh, Scotia's beautiful capital, where a hot local fight was waged, I have called on Mr. Ralph Earnshaw, the publicity manager for the No Change party—which means the liquor and brewery interests. All I wanted was a few specimen posters to illustrate this article and I made this request to one of his lieutenants on the ground floor of the splendid mansion in Melville Place, occupied by the publicity bureau. I was asked to wait, and I waited some ten minutes before the lieutenant returned and asked me to see Mr. Earnshaw in his own room upstairs. I found the famous manager a gentleman of quiet and charming manners.

"You know," he said, "there are a number of Americans hanging about this country trying to spy out information as to our activities. And I'm sorry to say that many of these gentry have betrayed our frankness and hospitality by going over to the other side and passing on information given in confidence, in some instances actually speaking at No License meetings and giving garbled and misleading statements in regard to my work and myself."

Mr. Earnshaw went on to report with particularity of detail an interview he had had with a certain American doctor of divinity prominently identified with the Anti-Saloon League's activities in the United States; one who had smoked Earnshaw's cigarets and left him with an expression of good will and the assurance that, as men of honor, although holding opposite views on the liquor question, they could rely on each regarding the conversation as confidential. But that very evening the reverend gentleman, Earnshaw said, had given a garbled and dishonest report of the interview at a public meeting.

Then I was informed of the activities of Mr. Earnshaw himself during a visit of several months to the United States last year, studying the effects of Prohibition. During that time, he visited a score of the principal cities between the Atlantic and the Pacific. Everywhere, he said, he had found that the enforcement of the Prohibition law was a sham and a delusion. Official statistics—and he had gathered a trunkful—proved that claims for the diminution of drunkenness, vice and crime were baseless. He had determined that he would not personally be a violator of the law and abstained wholly from intoxicating beverages during his stay, although this was made difficult by the kindness of people he met, who insisted on presenting him with *bon voyage* bottles of whisky as he traveled from place to place. At one millionaire's sumptuous home on the Hudson, his hostess, who had taken a conspicuous part in the fight for Prohibition, herself poured out a glass of whisky for him and one for herself before dinner. When he expressed some surprise, the lady declared that she was absolutely sincere and not inconsistent in her advocacy of Prohibition—for the working classes. Mr. Earnshaw declared that he found himself shadowed by emissaries of the Prohibition organization, not alone in America, but also in his own country. Nearly every man crossing on the ferryboats between Windsor and Walkerville and Detroit, he said, carried a bottle of whisky.

Going down to the shipping room we found a staff of packers very busy. Orders for 100,000 lots of each of the nineteen different election leaflets published by the committee were coming in from one town after another. He showed me specimens of bottle labels that had been issued by the million during the last six months. About two million grocer's paper bags carrying propaganda calculated to influence the woman voter had been distributed. This was regarded as a particularly fine stroke, as the housewife could not buy as much as half a dozen bananas at a licensed grocer's shop without carrying home propaganda along with the fruit. More than a million of the picturesque posters depicting William Wallace "Standing Fast for Freedom" on a thistle-clad Scotch hill, had been displayed. With pardonable pride, Mr. Earnshaw announced that he had himself drawn this poster. He had a hundred able speakers in the field, all in constant touch of his guiding hand. The expenditure on newspaper advertising ran up into the millions—and millions in Britain means millions of *pounds,* not dollars. A particularly neat small placard was called to my attention for its politeness and modesty. It ran:

> TO OUR CUSTOMERS:
> WILL THOSE WHO DO NOT DESIRE TO SEE OUR PLACE CLOSED UP BE KIND ENOUGH TO REMEMBER TO VOTE "NO CHANGE" AT THE POLLS ON ELECTION DAY?

This placard was hung up in thousands of "pubs" throughout the country.

The results in the voting in Dundee and other northern points were coming in during my visit and showed that NO LICENSE was being snowed under everywhere. Not only were the NO CHANGE majorities increased over those of three years ago, but there was an actual decrease of the NO LICENSE vote. Pointing this out to me, Mr. Earnshaw said: "These elections ought to show the Prohibitionists that they have not the ghost of a show in Britain. If they had any sense they would abandon the stupid fight. There is no possibility of Prohibition ever being adopted in this country. Even 'Pussyfoot' Johnson has been frank enough to see and admit that much in a signed interview given to the *Daily Mail* just before he left London. Scrimegeour's National Prohibition bill got just fourteen votes in a House of Commons of nearly seven hundred members; about two per cent! That certainly shows just how public sentiment in this country stands and how hopeless is the fight the Prohibitionists are waging!"

It is only fair that I should add that Mr. Earnshaw impressed me as a sincere man as well as an able propagandist. Moreover, he is undoubtedly a type of the great bulk of educated and thinking people in Britain. The Prohibitionists are far from giving up the fight and that fourteen votes in the House of Commons for the first national Prohibition bill may prove fecund seed. It will not be the last Prohibition bill.

How Zane Grey Is Discovering Our America

Concluded from page 3

plainingly. He knew that he was on the brink of failure.

A chance acquaintance turned the tide. On a trip to New York, only to be again rebuffed by publishers, he met Alvah D. James, who had just returned from a trip over the Andes. It was through James that he met Colonel C. J. "Buffalo" Jones, who was in New York showing motion pictures of wild life in Yellowstone Park. Jones wanted to get publicity back of his exploits.

"Take me out with you," said the eager Zane, who saw an opportunity. "Let me write your exploits. I'll prove that you can rope wild animals."

"How do I know you can write?" questioned the veteran. "Let me see something you have written."

A copy of "Betty Zane" was soon in his hands. For several days Zane stayed away in apprehension. Finally he summoned enough courage to make a call. He had been turned down so often, when he felt that he merited acknowledgment, that he had become fearful of every test.

"Where did you learn to write that way?" challenged "Buffalo" Jones, when he met him in the lobby. "You can go West with me."

"When the time came to start," admitted Mr. Grey, "I found that it would take the remaining savings of my wife. I didn't want to go that way. But she persisted. She said that she knew something would come out of this opportunity. So I went to Arizona with "Buffalo" Jones.

Out of that adventure, his visit at the Painted Desert, the head of the Grand Canyon, the ranches and wild-life experiences were to come a number of books.

When he returned to Lackawaxen, he wrote "The Last of the Plainsmen." Harper Brothers refused it as they had his previous works.

"We don't see anything in this to convince us that you can write either narrative or fiction," the publishers told him.

Crestfallen he returned to the elevator. His mind was confused. He groped to the street. The way became uncertain and he leaned against the iron lamp post at a corner of Pearl street. The cold touch of the iron seemed to give him a message. It was that he would win by persistence.

Work was immediately started on another book. It was to be a western romance. The winter was cold and he was compelled to stop every few moments to warm his numbed fingers. When he went back to Harper's, he asked Mr. Ripley Hitchcock to read "The Heritage of the Desert."

"My next visit to the House of Harper was different," he explained with a smile. "After seven years Mr. Hitchcock laid one of his famous blue contracts before me for approval. I signed it."

In spite of its tremendous sales,. the publishers hesitated when next he offered "Riders of the Purple Sage." Finally on the strength of his first novel they accepted it. Its sales have reached more than a million copies. Success had been achieved at the turn in a long and troublesome journey.

With the financial rewards came travel. He made more trips to the Utah canyon country; visited Southern New Mexico and Arizona and spent three winters in Yucatan, Cuba and Mexico. His permanent home is now at Altadena, California.

"Mr. Grey spends much of his time traveling in wild places and thus gets the inspiration and scenes for his books," Mrs. Grey told me, when I made inquiries in June for her husband. "His stories are stories of settings principally. As for writing, he does that wherever he happens to be."

Perhaps it is the things that he writes that makes him a success. He finds romance in the open spaces of America. Sex problems do not appeal to him. He strives to bring the story of American life to the reader set in places that the camera transforms into wonderful pictures. It is because he writes of America, its far-away spots where few have gone, that the screen men find his books so much in demand.

The Rainbow Bridge in Utah where Grey gets color for his books.

The vine-clad cottage at Altadena has in it a workshop where most of his books are written. The walls are bare. There are no pictures. There are no shelves crowded with inviting books to distract the attention. He sits in a Morris chair and writes with a pencil on a board across the arms.

"Sometimes I write six or eight hours a day," he recently explained. "I do my best work after I have been writing about six hours. My wife and I go over the text together and we make many alterations—many are her wise suggestions."

On the third floor of the cottage is a room given to books. There are the favorite volumes of Hugo, Stevenson, Poe, Kipling, Ruskin, Hudson and Darwin. There also is a row of his own volumes: "Betty Zane," 1904; "The Spirit of the Border," 1905; "The Last Trail," 1907; "The Last of the Plainsmen," 1908; "The Short Stop," 1909; "The Heritage of the Desert," 1910; "The Young Forester," 1910; "The Young Pitcher," 1911; "Riders of the Purple Sage," 1912; "Desert Gold," 1913; "Light of Western Stars," 1914; "The Lone Star Ranger," 1915; "Rainbow Trail," 1915; "The Border Legion," 1916; "Wildfire," 1917; "U. P. Trail," 1918; "Desert of Wheat," 1919; "Tales of Fishes," 1919; "Man of the Forest," 1920; "To the Last Man " 1921; and "The Call of the Canyon," 1922.

More than two million five hundred copies of his books were sold last year. His latest volume, "The Call of the Canyon," deals with the soldier problem. Upon this subject Zane Grey feels deeply. It carries with it an appeal to help the disabled soldiers of the World War. Its pages contain a scathing rebuke to the infidelity of those who would turn this responsibility aside.

While his wife and three children are spending this summer at Altadena, Zane Grey is out gathering the color for new writings. He has gone to Southern Utah to capture the beauties of the wild, abrupt slopes of the Wild Horse Mesa. No man has yet seen it except from the distance.

"That country is going to be the scene of my next novel," he told his family early this spring. "I shall make an effort to scale the heights and will write a story about the characters that I shall meet in that picturesque country."

Outdoor life invigorates him. When he comes home from his travels he is as brown as an Indian, his body as hard and lithe as an athlete. His thin-drawn face; his sparkling, deep-set, brown eyes; his crown of hair turning to silver at his approaching half-century birthday, make him a picture of action, determination and courage. He finds his interest in bringing America to the Americans; his purpose in life in attempting to arouse the people to the dangers which threaten with the vanishing wild life of the country.

"Places inspire me in some sense as they did Stevenson," he recently explained. "I love wild canyons—dry, fragrant, stone-walled, with their green-cloaked niches and gold-tipped ramparts. I love to get high on a promontory and gaze for hours out over a vast open-desert reach, lonely and grand, with its far-flung distances and its colors—I love the great pine and spruce forests, with their spicy tang and dreamy peace, and murmuring streams and wild creatures.

"The Grand Canyon appalled and depressed, yet exalted me. Never yet have I attemped to write of it as I hope to. The lonely, white, winding shore line at Long Key, a coral inlet in Florida, always inspired me to write. I have wandered there many profitable hours. Clemente Island in the Pacific calls and calls me to come again to its bleak, black bluffs; its tawny wild-oats slopes, its bare desert heights, its white-wreathed rocks and crawling curves of surf; its haunting sound of the restless and eternal sea; its lofty crags, where the eagles nest, and its almost inaccessible ledges, where wild goats sleep, its canyons of silence and loneliness.

"Death Valley is a place to face one's soul, aloof, terrible, desolate, the naked iron-riven earth showing its travail. The sage slopes of the Painted Desert is the place for the purple that is the most beautiful of all colors. Then the sand steppes and the rock walls, the mesas, escarpments, domes and peaks of the desert flame with wonderful colors. Among features of nature I love color best. All of which is to say that my romances are simply the expression of my feeling for places."

The Sapiro Burr in Oregon's Golden Fleece

Concluded from page 6

The fourth point of the Sapiro-Steen claim is that it has a sales manager to sell its wool. When the consumption of woolen goods and wool in the United States is 600,000,000 pounds, roughly, a year, and the production of raw wool in the same country is only 300,000,000 pounds in the same period, what in the name of good business can a sales manager do that the farmer or sheep-raiser cannot do, except draw the ten or fifteen thousand dollars a year which the kind farmer puts in the sales manager's hand?

As a matter of fact, the officials of several of the co-operative marketing associations, organized and directed by Aaron Sapiro, have refused to sell the farm and orchard products over which they had control, unless the buyer would give them a "bonus." Mysterious as it may seem, the farmer never saw this "bonus," and this is the first time that thousands of farmers in the West will know that the men to whom they intrusted their crops and their money took pay not only from the credulous, co-operating agriculturists, but also from the buyers to whom those crops were sold.

Aaron Sapiro may not know this; it would be contrary to his usual practice to allow such obvious trickery to be carried on. But The Dearborn Independent is prepared to deliver the facts upon demand, including the names of those who took the "bonuses," and the places and dates at which they were taken, as well as the crops for which these "bonuses" were paid.

The second industry of Oregon is the production of wool and its weaving into garments, blankets and other goods. Here is one of the large woolen mills in the heart of Portland.

Fifth and last, the Sapiro combination holds up the "orderly marketing" feature of the "Pacific Co-operative Wool Growers." Let us not get away from the wool-growers of the Northwest; there is plenty of time later to tell how the wheat and hay and potato and cotton and tobacco men were looted. You have observed already that, through the system of having a manager, a sales manager, agents, and so on, the control of the farmer over his own product is entirely taken away from him. He cannot have even a committee of his own fellow-farmers to supervise the disposal of his wool as ordered by this sales manager. He must submit without protest to sale, when, where, to whom and at what price the sales manager dictates. Wasn't there quite an important war fought some 148 years ago over a similar situation?

The "orderly marketing" scheme cost the prune-growers, not to mention their associates, the apricot-growers, of California, rather more than $1,280,000 on the 1920-21 crop. If you doubt this, read the article on the subject in these columns in the issue of April 26, 1924. That article never has been denied, or even contradicted. This is what "orderly marketing" did to the fruit-grower; it has done worse to other classes of farmers, as it is well set today to do to the wool-producers of Oregon, Idaho, Washington and California. Time—the greatest detective in the universe—is slowly, surely, inexorably, telling the truth about Baruch, Lasker, Sapiro, Myers and the rest of those gentlemen making up that unnamed organization which is so successfully "doing the farmer good."

Now, the Co-operatives have put in a plant at Portland to sort, grade and scour the wool. This is a co-operative invasion of the American manufacturing field, and, as we proceed with these articles, we shall see a marvelous similarity between the methods which have applied to Russia, and those of this co-operative marketing ring.

How Chinese Quacks Wax Fat

Concluded from page 5

is circularized with “come-on” letters, promising cures of every disease under the sun by the use of Chinese herbs. Sometimes an American, usually in the chiropractic or osteopathic field, or a mental or religious healer, is employed to “steer” men and women of prominence in the community to the offices of the Chinese. In the main, however, newspaper advertising and so-called “personal” letters, are relied upon to bring in the gullibles. Even to the man familiar with the inside of the newspaper business in the United States, the manner in which these supposedly American newspapers promote and defend the interests of these Oriental invaders of the physical welfare of the American people, is little less than astounding.

The letters sent to persons known to believe themselves to be ill, or to be actually ill, contain “personal diagnosis sheets.” The man or woman who answers the questions on one of these sheets will be in a frame of mind at the end to believe that he or she has any and every disease known to humanity, and the psychological effect of this autosuggestion blank is to send the person scurrying to the Chinese “doctor.” When the prospective “patient” enters the office of the Oriental, he first sees a sign, on which is printed, flanked by gaudy Chinese characters, the name used for the time being by the Chinese “doctor,” who, as likely as not, was a cook, a bell-boy, a stevedore, or an opium peddler before he assumed a degree in medicine.

Within the office, the “patient” finds black and gold or yellow and red hangings, massive teakwood chairs, carved elephants, jars of mysterious powders, leaves, roots, and dried animals and insects. He is allowed to sit and consider these various Oriental adjuncts to “health” for several minutes, until he is in a mood to believe whatever “Sing High Low,” or “One Lung Yet,” tells him about his own precious life. Then there appears, silently through the heavy curtains, a solemn-faced Chinese, dressed in American clothing. Asked if he is the doctor, this “capper” replies that he is not the doctor, merely a student, who, while he aspires to be one day as eminent as the Doctor, he is as yet only a novice sitting at the feet of wisdom’s father, or some other drivel of like import. He then offers to act as interpreter, and leads the patient into a room still more beclouded in mummery, where, dressed in an expensive mandarin coat, or yellow priest’s robe, the “doctor” sits.

A few years ago, the patient was permitted to see the “doctor,” but so many of these Chinese swindlers have been caught by clever investigators for the state governments that now the “physician” provides a screen behind which he seats himself. The patient passes his hand through a slit in this screen, and the interminable pulse-taking begins. Without using a watch, the “doctor” twice “takes the pulse” on each arm of the patient. This is the sheerest buncombe, because, first, it is impossible to obtain a record of the human pulse without comparison with the passage of time accurately told by a watch; and, second, there are a number of diseases, some of them extremely dangerous, which have no appreciable effect on the pulse.

Speaking through the interpreter, the “doctor” then requests the patient to tell all that he or she knows of his or her own “case.” While the interpreter is repeating all this to the “doctor,” the latter, with the regulation Chinese brush-pen and cuttlefish ink, is making marks on paper, supposedly writing down what the patient has told him. In one instance, where two operatives were working for the medical board of a western state, the “doctor” was found to be marking a ticket in a Chinese lottery in San Francisco. The conversation in this instance between the interpreter and the doctor was afterward declared by the former to have been a discussion of how best to mark this ticket, instead of a translation of the statements of the patient. Doubtless similar subjects are discussed by interpreter and “doctor” while the patient is placing his life in their hands, in the majority of the offices of these “herbalists.”

When this three-cornered diagnosis is completed, the “doctor” prepares a “prescription” for the patient. In the old, care-free days, before the authorities went on the hunt for the Chinese, such prescriptions were given to the patient, with instructions as to which Chinese drug store he should visit to have them filled. Nowadays, however, and especially in the smaller communities, where there are no drug stores operated by Chinese, the “herbalist” fills the prescription himself from his own stock of drugs, and never allows the patient to see it, much less carry it away with him.

From translations of some of the older prescriptions, however, the writer has obtained the following interesting collection of “remedies”:

Heart troubles of all kinds, hair of the tiger, chopped finely and mixed with the dried leaves of the tree under which the tiger was killed.

Diseases of the lungs, ground claws of the lion, mixed with the dried blades of the herbage on which he died. Doubtless the ability of the lion to roar is passed on to the lungs of the patient by the eating of the animal’s claws.

Diseases of the brain, pulverized thorn beetles, mixed with oil of a non-poisonous snake. Though this “prescription” called for “thorn beetles,” whatever they may be, the jar from which this particular “doctor” took the beetles for pulverizing, contained four different varieties of the insects, as well as the dessicated bodies of several large white moths, apparently caught in the office of the “doctor.”

Pains in the liver, spleen and pancreas, the general upper abdominal section, dried toads ground, and mixed with imported willow leaves.

Jars containing dried toads, beetles, dried snakes, and snakes preserved in what appeared to be some form of alcohol, as well as bamboo tubes containing animal hair finely ground, and a large number of packages of dried leaves from various trees, were taken from the office of this “doctor,” who, with two companions, was operating one of the branches of the largest of these “herb importing” organizations in the United States. Beyond a doubt, this collection of prescriptions and “drugs” is a fair sample of the highest grade of medication furnished by the Chinese “doctors.”

A demonstration of pulse diagnosis by Dr. Foo.

Identification of mixed plant extracts, ground leaves, pulverized vegetable or animal matter, especially those containing materials not readily isolated, is often impossible, and usually very difficult. In almost all instances, it is necessary to take the stuff found in Chinese “doctors’” offices and in Chinese drug stores, at its face value, and to accept as correct the label on each package. In view of this condition, the writer was much interested to learn, while in Los Angeles, not long ago, that a young American, who shall be nameless, was earning a good salary by catching and clipping stray dogs, thereby supplying the necessary “tiger and lion hair” to a set of Chinese “herbalists.” Probably the “claws” of the lions and tigers came from the feet of defunct house cats. Who knows?

The patient, once equipped with this marvelous mess, formerly was allowed to take it home with him, and there brew the “tea,” or take the powder dry, as directed by the “doctor.” In these days, when a little more effort is being made to protect Mr. Average American from the medical fraud, the majority of these “herbalists” compel the patient to take the medicine right there and then, in the office. As might be imagined, these decoctions have quinine, asafetida and ipecac backed into the ice-cream soda class as far as taste is concerned. The writer knows, for he has tried some of them, and got away with them, too, right in front of the moon-faced “doctor,” who, less than six months before, had been a dishwasher in a leading hotel in San Francisco. One clever investigator for the California State Board of Medical Examiners, who has to his credit more convictions of these Orientals than any other man in this country, carries in a specially constructed vest pocket a rubber ball, connected to a tube about eighteen inches long. When he goes to “take his medicine” from one of these dried-toad experts, he sticks the free end of the tube into the cup, squeezes and releases the rubber ball, and has a perfectly good sample of the “medicine.”

The prescriptions and the medicines dispensed by these Orientals are of three grades, depending on the ability of the patient to pay. The average price for the diagnosis is two dollars; for a dose of “first-grade” medicine, two dollars; second-grade, one dollar and a half, and, third-grade, one dollar. The length of treatment varies also with the ability of the patient to pay. Very poor men and women can be “cured” with twenty-five doses, costing them, with the “diagnosis,” twenty-seven dollars. Men and women who can afford to pay for “second-grade medicine,” never can be cured with twenty-five doses; no, indeed, their “cures” require from thirty to fifty doses. And there is no limit to the doses the “first-grade” patient will be required to swallow, so long as he pays. By the way, these “physicians” have one rule in common—the patient pays before the medicine enters him; no chances are taken on giving him credit until he has swallowed it. When the patient was sent to the Chinese drug store with the “prescription,” he paid both for the compounding of the remedy and for the writing of whatever it was that passed for a prescription; today, he pays for both at once.

The writer recently had himself “diagnosed” by five different Chinese “doctors,” in four cities. From them he was surprised to learn that he had:

Incipient tuberculosis, an involuted stomach, a “foreign insect” in the stomach, diluted blood, an “eating cancer” in the lung, not saying which lung, and several minor troubles, such as high blood pressure, deficient hearing soon to become complete deafness, and poor eyesight with danger of going blind.

This is almost as good as the mechanical diagnosis made profitable by the domestication of the Electronic Reactions of Abrams, and somewhat better than the illuminating statement of the itinerant Parsee, Ghadiali, that “the disease is where the pain is.” Friends of the writer need not be alarmed, nor his enemies overjoyed, by the discoveries of these “herbalists” for the X-ray and a whole flock of American physicians have declared him rather better than one hundred per cent pure.

When the patient comes back for his second dosage, he does not see the same “doctor” at whom he got a glimpse before the clever swindler stepped behind the screen at the first visit. At that first call, the visitor was told that he was to be treated by “Dr. Sam Slow,” let us say; on the second visit, he naturally calls for Doc Slow, and is taken to him, yet the Chinese this time is not the same whom the patient saw before. There is method in this changing of “doctors.” It makes identification, always difficult with Orientals, almost impossible, and unless you can identify your doctor, you have little chance of convincing a judge or a jury that the accused man ever treated you.

This hiding of identity is particularly valuable in cases in which some one of the three or more Chinese in each “office” is accused of criminal malpractice or of illegal operation. Another man than the one who committed the crime will appear in court, declare himself to be the only “doctor” at the given address. The victim cannot identify him, and the case falls to the ground. Similarly, the Federal investigators in the field of forbidden drugs have been confronted by the same kaleidoscopic changes of identity, with the result that convictions of these “doctors” as drug distributors are almost impossible to obtain.

Americans who patronize these Chinese “doctors,” “herbalists,” “medicators,” or “Oriental healers”—whatever they may call themselves—are not only throwing their money away with not even the remote possibility of help on the way back to health, but they are contributing to the support, within their community, of a class of men who, in the vast majority are criminals, and who, without exception, are defrauding the American people, both of their money, and of what is of more importance, the opportunity to be relieved of whatever illness, if any, they have.

(In a succeeding paper, Mr. Sloan will tell of what has been done to eliminate the Chinese medicine men, and how they evade the laws of the United States.)

Have You Ever Signed a “Myself” Note?

Concluded from page 4

honorable and courageous Detroit banker got wind of it and informed the country bankers of the risks and shadiness of such transactions.

Although stock in this packing company was sold to the extent of more than two and a quarter million dollars, it is now in a condition of such difficulty that the officers are asking the stockholders to deposit their stock as security for a big cash loan to the company. This is one of the many instances where honest and useful co-operative efforts on the part of the farmers has been shackled from the first by the financial methods adopted. Yet a Morgenthaler is always at hand to do the “organizing.”

At the very time the Des Moines and Detroit packing house stocks were being sold and the Midland Packing Company of Sioux City was spending $2,500,000 to get $6,272,000—and then failing—it was known that the big packers were in difficulties because of general conditions.

Morgenthaler then moved over to Cleveland, Ohio, where he attempted to use the same old gang of dynamiters to sell bonds of the Federal Collieries Company. Commissioner Beck, of the Ohio Blue-Sky Office, who has been mentioned in this publication, soon reprimanded Morgenthaler because his salesmen were “pounding” other securities. This meant they had secured lists of stockholders in other companies and were trying to get them to convert their holdings into the paper offered by the high-tension boys.

Commissioner Beck then canceled Morgenthaler’s license and made him close up his office.

The dynamiters were now out of a job and in danger of destitution. Colfax Gibbs came to the rescue by taking them down to Louisville, Kentucky.

Gibbs organized the Silica Asphalt Company, a Delaware corporation, claiming to own leases of about 18,000 acres of asphalt land in Kentucky.

Three politicians headed this new asphalt company, and the Kentucky Blue-Sky Office obligingly gave the license in spite of the information which outraged Michigan people began to send down South. Then the Michigan people informed Kentucky bankers, editors and business associations in every county seat of Gibbs’ record. This broke the game. The bank that had agreed to act as trustee for the stock issue withdrew, and a man of standing who had become an officer resigned at once.

In conclusion, it can be seen that this is the record of more than fifteen million dollars of stock sales that would not have been possible if bankers had not succumbed to the “myself” note game. Fortunately bankers in the large cities, better business bureaus, and the National Vigilance Committee of the Associated Advertising Clubs of America, where this work centers, are making headway against this abuse of banking and of the public.

Country bankers who are approached by high-tension operators with “myself” notes or any other plan should not only repulse them but immediately send the details to their big city correspondent banks who will help to stamp out the pestilence. This should be done no matter how tempting the idea may be.

People who hear of high-tension stock-selling schemes or have purchased such stocks outright or given notes, should immediately write to the National Vigilance Committee of the Associated Advertising Clubs of America, New York City, giving all the details. These schemes spring up so fast that it is only through such *volunteer action* that they can be dealt with.

"I like to see a man proud of the place in which he lives. I like to see a man live in it so that his place is proud of him."—*Abraham Lincoln.*

The United States Patent Office has issued its 1,500,000th patent. It was taken out on a submarine designed to travel under ice and rise to the surface by breaking its way through the ice. The first patent was issued eighty-eight years ago.

The Post Office Department has equipped more than five thousand mail clerks with gas masks supplied by the army's chemical warfare service because of the recent mail-car robberies in which bombs of poison gas were used to force the guards to desert their posts.

With damaged hull and propeller broken the old coast guard cutter, *The Bear,* is wedged and stranded in the icy floes of Kotzebue Sound on the northwest coast of Alaska. For the first time in her half-century's history (she was making her fiftieth trip), the old vessel has been forced to abandon the annual cruise for the relief of natives and white settlers in the land of the midnight sun.

The late Mallory and Irvine of the Mt. Everest Expedition have at least established the world's record in mountain-climbing. They were within less than 800 feet of the summit of Mt. Everest when last seen—a height of 28,227 feet.

Sunlight develops an antiseptic in our blood which kills germs very quickly. People who live in darkness do not possess this "antiseptic" blood.

In making estimates on the cost of the air mail recently established between San Francisco and New York it appears that on the first eastward flight eight thousand pieces of mail were carried and $2,308.48 received. This netted a profit of more than forty per cent, or, to be exact, $539.68.

Grapefruit, entirely unknown to the average Britisher before the war, now forms a regular part of the early morning diet in thousands of households in Great Britain.

An American agent for a British company was murdered on the upper Yangtse by pirates operating from junks. The commander of a British gunboat executed a summary justice by insisting that the heads of the junkmen's guild which committed the outrage should be shot on the beach where the American was attacked. This was done.

The pearl diver in the Persian Gulf, wearing only an amulet for protection against the sharks and carrying a small net, is lowered over the side of the boat. A forty-pound stone and a rope is attached to him. He fills his lungs, clasps a clothespin on his nose and dives down. In about sixty or eighty seconds he reappears with his net filled with oysters.

Edward Fitzgerald sent 500 copies of his translated Omar Khayyam to a dealer in Hempstead, who tried to sell them at sixpence apiece. Failing to dispose of them he asked Fitzgerald to come for his books. Those first autographed volumes are selling today for anywhere from $300 to $1,000 each.

Unlike the tiger, the leopard is an expert tree climber.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A glass fruit jar with a paper inside bearing his name is the only marker on the grave of James Bethel Gresham, first A. E. F. soldier killed in the World War.

The Tokio telephone bureau has issued detailed statistics that are very interesting. When a woman is talking to a woman, it is claimed, 26.4 per cent of the talk is idle and unnecessary; when a woman calls a man, the waste is 13.8 per cent; when a man calls a woman, it is only 9.7 per cent; when two men talk, 10.6 per cent.

The Avon River, made famous by Shakespeare, has become a "river of death" because of the sewage from the town of Coventry. Plant life has ceased to grow in it, fish have died and even the branches of the trees touching its waters have sickened and died.

Mexico has compiled a list of 350 isolated cases of Mexican citizens killed in our border states during the years 1915-21. Together with claims for damages, including losses to commerce and the killing of several hundred Mexicans during the occupation of Vera Cruz in 1914, this list will be presented to the Mexican-American Claims Commission which is about to meet in Washington.

Thirty years ago in a native hospital on the Portuguese island of Macao, off Southern China, Sun-Yat-Sen, the first president of China, performed operations that seemed to the natives like black magic, when he cut men's bodies open, applied the knife to their organs and then sewed their bodies up. At that time he was a successful surgeon.

Among the Menangkabaus tribes of the west coast of Sumatra the husbands have no property, no homes, no rights in their children. They are only visitors in the houses of their wives. The woman owns the property and the line of descent is through the mother.

At least forty per cent of our foreign trade is in American farm products. About ninety per cent of this trade is with European countries.

Twelve branches of science will be represented in the 1925 Asiatic Expedition conducted by Roy Chapman Andrews. It is believed that the life of the Nestorian Christians, who went east from Persia, may be further uncovered.

The canine population of France is 3,313,116.

This coming December two hundred camels will travel with the 1925 Asiatic Expedition. The camels, in thick, shaggy winter coats, will start in the dead of winter at forty degrees below zero. This fact is surprising to many who believe the camel to be a hot desert animal unused to severe low temperatures.

That Abraham lived near the brick tower of the Ziggurat of Ur and other discoveries closely related to Bible history are claimed in a report of C. Leonard Wooley, the noted archeologist in charge of scientists from the University of Pennsylvania, now exploring in Babylonia.

Celtic Christianity is said to have preceded the Roman faith in Iceland, being introduced from the British Isles where it lingered for several centuries after the followers of Columba were vanquished at the council of Whitby in 664.

It is estimated that eighty per cent of the narcotics entering the United States come in illicitly.

Discovered by Magellan in 1521, the Philippine Islands remained Spanish possessions, with the exception of brief seizures by the British, Japanese and Chinese, until their cession to the United States in 1898.

It is estimated that the Alaskan forests could supply enough pulpwood to make one-third of all the paper products used annually in the United States.

While Columbus is usually credited with the discovery of America, it is certain that Cabot, sailing out of Bristol, beat him to the mainland, and it has also been claimed that the Norsemen sailing via Greenland, had reached the American coast some centuries before that.

The late G. D. Smith of New York once paid $75,500 for the little quarto containing the fourth edition of Shakespeare's "Venus and Adonis" and the first of "The Passionate Pilgrim." In the Capell corner of the library at Trinity College, Cambridge, is a nearly identical volume which cost the original owner three cents.

Charles Dickens' old home, Gadshill Place, is being transformed into a young ladies' boarding school.

California has three hundred centenarians.

Almost every industry in America shows that high wages lead to increased production and diminished costs. What a fatal policy we have pursued since the war.—*John Bull.*

So-called "Laziness" found among the inhabitants of tropical countries is due to disease, says an expert.

Robbers and man-eating animals are two of the dangers which India's native postmen have to face in lonely districts.

There are three golf courses on the Belgian coast.

According to *Collier's,* eighty per cent of the voters cast ballots in 1896; in 1900, seventy-three per cent; in 1908, sixty-six per cent; in 1912, sixty-two per cent; in 1920, less than fifty per cent.

CHRONICLER OF THE NEGLECTED TRUTH

They Are Blazing the Trail for Travelers by Air

American Aviators Greeted by Compatriots on Arrival in London;

Another Important Step in Realization of a Great Poet's Prophecy

By WILLIAM L. STIDGER

Why did U. S. Army aviators fly around the world? Was it a speed stunt, an endurance test, or a spectacular exhibition feat?

Far from it.

Those three flyers were on a scientific quest. They were not dare-devils but research workers.

In reply to a wire from THE DEARBORN INDEPENDENT, Dwight F. Davis, the Acting Secretary of War, said: "Around the World Flight will demonstrate feasibility of aerial communication between continents, obtain information necessary to base future flights and furnish first-hand data necessary to the development of commercial planes for this purpose. The Army now blazes its way for air transportation as it did on land in the days of the covered wagon of the sturdy pioneers."

"THE Campbells are coming, hurrah! hurrah!" in London today has been changed to "The Americans are coming, hurrah! hurrah!" for at noon the three United States world-encircling aviators landed in this great city.

They started from California, March 17. Today several thousand of their fellow Americans greeted them and sent them off on the last lap of the most remarkable flying trip around the world that has ever been made. By a coincidence, the Advertising Association of the World is in session in London, with about two thousand Americans on hand to give a fitting welcome to these intrepid and valiant voyagers through the air.

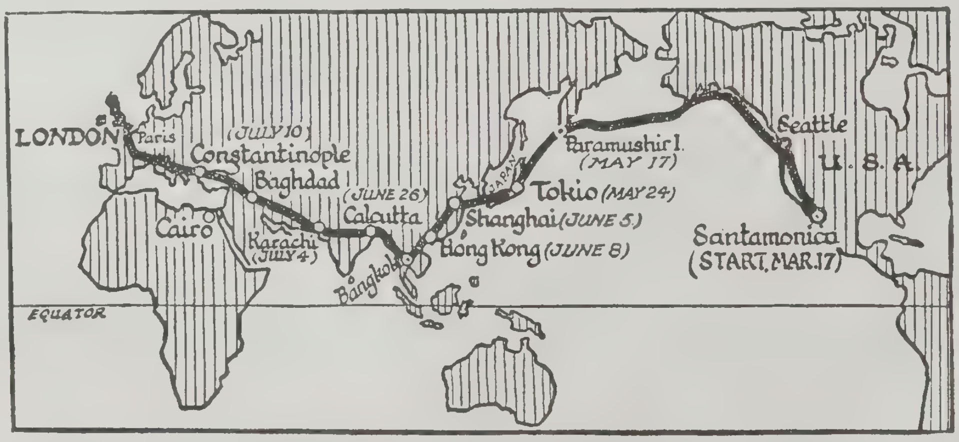
The American group was tense with expectancy this morning when the papers announced that the American aviators would take off from Paris at ten o'clock and arrive in London about one.

I had the honor with Mr. Le Roy Pelletier of being the first American to greet these world fliers. In the name of THE DEARBORN INDEPENDENT, I had no difficulty in getting credentials through English pressmen, who allowed me within the field of landing, where only a few, comparatively, were permitted to be, mostly photographers, the reception committee, and officials. The aviators left Paris at eleven-five and landed in London, at Croydon Landing Field, about two o'clock, smiling and happy. They were escorted across the English Channel by the Handley-Paige machine which makes daily trips.

I talked with several of the passengers who flew over in the escorting plane and they reported that our men flew in formation all the way from Paris within a hundred yards of them.

We Americans who had arranged to meet our countrymen in this memorable landing arrived on the aviation grounds, after a strenuous trip from London by taxicab, a half hour before the three American ships came into sight as mere specks against the sky.

It had been a cloudy morning, but about fifteen minutes before the signal that the fliers were in sight was given, the clouds began to swing back, as if some invisible hands in the skies were lifting a huge curtain for our heroes to pass through. A great patch of blue sky, about the size of a house, appeared at first, growing larger and larger until a patch the size of an acre gradually widened. We watched anxiously, following the signal.



Route of the American aviators.

Then suddenly a shout went up. "There they are! There they are!" A thrill went through every American heart when he saw, far off in the distance, those tiny specks which looked like sparrows sailing toward us.

"There are five planes!" shouted an English officer who was with us. His keen eye had sighted five before we could see them. He was Major Blake, of the British Army, who was the first man to conceive of this idea of flying around the world. He got as far as Burma and his machine broke. He was a fascinated spectator and a good friend to us as we stood with him watching this conquest of the air by our kinsmen. Major Blake is a quiet, young appearing Englishman who welcomed our fliers with a good sportsmanship that was fine to behold.

He was right; there were five machines in formation. First there was the Handley-Paige escorting, then there was a commercial machine, taking photographs for a London newspaper; then came our three fliers in a triangular formation.

The wife of Squadron Leader MacLaren was with Major Blake to greet these American aviators. Her husband is now on his way around the world making the same trip, only going in the opposite direction, and by the time this article sees publication the United States will know whether or not MacLaren or our fliers have been the first to encircle the globe.

When I greeted Lieutenant Lowell Smith and his two comrades, their propellers were still whirling and a cloud of dust was flying all about us. It was a thrilling moment for them and for us.

But to go back to those five specks against the sky. As they grew larger and larger the crowd was still, and scarcely a sound could be heard save the far-off drumming of the propellers. Then, before we knew it, the commercial plane had disappeared, sailing off toward London with its precious photographs. But on came the Handley-Paige and the three Americans in their triangular formation until they flew above our heads. After circling the field three times they straightened out into single file, one following the other, and swooped down to the rather small landing field.

Lieutenant Smith brought his plane to earth first, as gently as a sea gull alights on the waves. It was a beautiful thing to see how gracefully he landed. An English aviation officer exclaimed, "Jolly well done! Jolly landing! Your Americans do it well!"

It was good to see the red, white and blue colors on our three ships. It was good to see these three pilots and their mechanics, young appearing, all of them, boyish in their enthusiasm, tanned as Hindus, smiling, bright-eyed, clean-looking. We Americans were proud of our representatives in the air.

When I spoke with Lieutenant Smith and expressed my delight at the marvelous achievement, he said, "It is nothing much."

Leaving Santa Monica, California, March 17, our men flew to Seattle and then across bleak Alaska. Major Martin ran into a mountain side and was compelled to make what is called a "pancake landing." He had hard luck from the beginning and had to give up his command and come back to the United States. Lieutenant Smith was then given command and it was he who led the three ships to London.

Crossing from Alaska to Paramushir, Japan, they landed on May 17. Then to Tokio, Japan, where they arrived May 24 amid great acclaim by the Japanese. The men told us today that their most enthusiastic reception was given them at Japan, in spite of the Exclusion Act and the feeling against the United States at that time. They sailed from Tokio to Shanghai, China, arriving June 5.

Leaving Shanghai, China, they sailed down to Hong Kong, which they reached June 8. This is a British port. From there to Calcutta via Bankok, Siam, took from June 8 to June 26. While at Bankok they were greeted by Siam's aviation squadron. The King of Siam is an enthusiastic aviator and, even though his country is small and far away, he has had in training since the war a large air navy. From Calcutta, India, the next jump was to Karachi which was reached on July Fourth, and then to Bagdad. From Bagdad to Constantinople, the trip was across desert land. They reached Constantinople July 10.

At Constantinople they were delayed an extra day, much to the disgust of the aviators who told us about it, because the Turks would not allow them to land unless they would remain long enough to permit the Turkish officers to inspect the American planes. From Constantinople the jump was direct to Paris.

They were greeted in Paris with great enthusiasm, the Olympic Games being in session and thousands of Americans being on hand to hail them. The Paris papers called it the greatest feat in aviation to date.

From London the three pilots will sail by way of the Orkneys to Greenland, thence to Labrador, and Newfoundland to the Atlantic Coast and then back to the Pacific Coast.

These fearless American voyagers of the sky have surely taken the high road to London town. They have crossed the highest mountains on earth, the widest seas, deserts, cities, two continents, and they do not seem to have felt the wear and tear greatly. The ceaseless round of entertainments is the chief object of complaint and when we greeted them at Croydon field the first thing we noticed was a coldness. But when Mr. Pelletier and I told them who we were they remarked, "We thought you were another committee inviting us to a banquet. We're off banquets."

These United States fliers were not sent out by the army to make a record in speed, but to study the air currents, and to map out the first trail through the air around the world. They have taken careful and exhaustive statistics, figures, and computations that will be of invaluable assistance to all other aviators who attempt this flight, which will be many, in the future.

Each of the three great planes had in it a Liberty-Ford motor. We asked especially about this just after the great birds had swooped to earth and the engines were still hot from the trip across the Channel.

It is a great epoch-making moment in aviation history.

These men are the Marco Polos, the Magellans of the air.

Magellan was the first man who ever circumnavigated the globe. Our Americans are the first group of planes ever to circle the world in the air. It is something to hand on to one's children; this privilege of greeting our fliers in London.

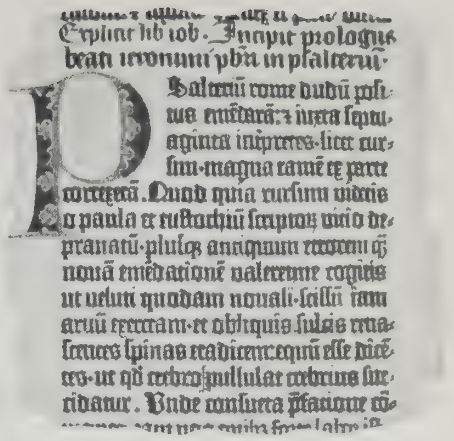
Curiously enough, these men, whom we have greeted this morning in London town, have fulfilled a great poet's prophecy, written in London a century ago:

"Then I looked into the future
Far as human eye could see
Saw the glory of the world
And all the wonders yet to be;
Saw the heavens filled with commerce,
Argosies with golden sails;
Pilots of the purple twilight
Dropping down their costly bales;
From the skies an awful tumult
And there rained a ghastly dew;
From the nations airy navies
Grappling in the central blue."

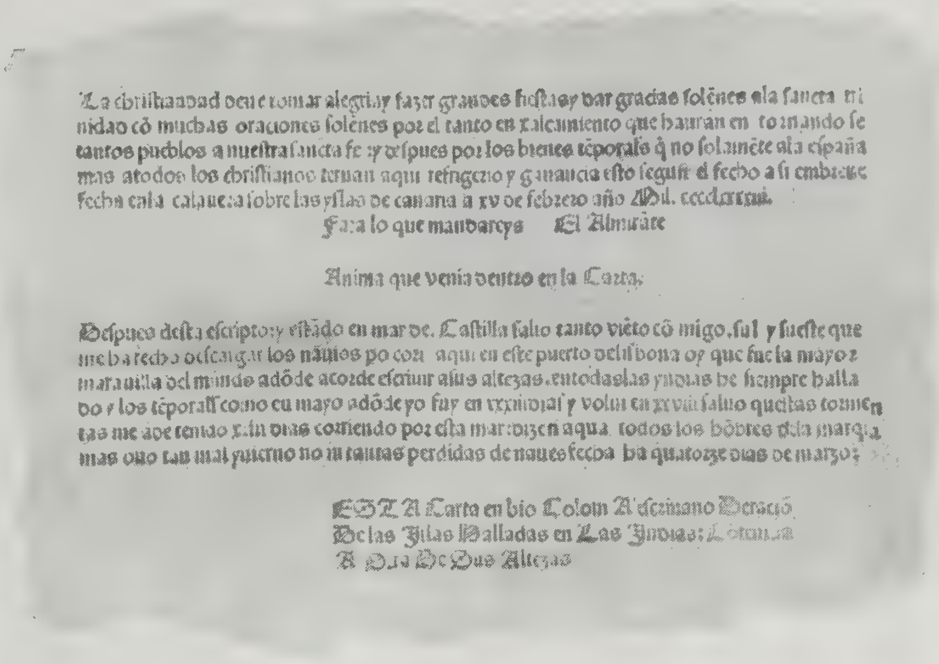
A Psalter Now Worth $75,000

Rare Books Which Pioneer Printers Produced

By LOUIS C. KARPINSKI



Psalter, printed by Fust, pupil of Gutenberg, about 1456. One of the most valuable books known.



The earliest Columbus letter, only one copy known. It is signed, above, El Almirate: the footnote states that this letter was sent by Columbus (Colom) to the Secretary "de Racion," et cetera.

NO PIECE of machinery that has been invented has so greatly influenced the history of the world as the printing press. By the device of movable type and a press, the labor over long years in copying books by more or less learned scribes became the work of a few hours. The printed page made possible education for larger groups of individuals through contact with the thoughts of the great thinkers of past ages. This connection with the past which distinguishes man from animal was heightened and given more bonds of contact by the printed book.

Small wonder, then, that the wonderful invention has been honored almost from the beginning. Small wonder, too, that the beautiful products of the early presses have since their production been prized as choicest treasures.

The early products of the printing press were indeed works of great beauty. Surprise is often expressed that printing should have sprung into being, like Athena from the head of Zeus, full-armed. The reason for the beauty and completeness of the early books lies in the fact that the early printers took as models for their type the artistically fine manuscript writing in use by the learned scribes who had been devoting their lives to the production of manuscript books. Not only the type but the form of page was copied from the manuscripts. Even the abbreviations used by the scribes were long used in print, where they were not necessary, and the large initial letters which were frequently illuminated with gold and colors in the manuscripts caused early printers to leave large blank spaces to be decorated by hand with fine initial letters.

The book which was most frequently copied was, of course, the Bible. With the discovery of printing the first monumental undertaking by Gutenberg was the Bible, and this first printed book has become, as a specimen of printing, one of the most famous books of the world. A copy of the Gutenberg Bible recently sold at $60,000 and were ten more copies to be discovered today buyers would be found to pay as much for each copy.

The Gutenberg Bible came into prominence first through the finding of a copy in the library of Cardinal Mazarin of Paris. It is often called the Mazarin Bible. About thirty copies have been found and the finding of new copies has served only to increase the price at which the book sells. At least six copies are in American libraries; the J. P. Morgan Library has one copy on vellum and also a paper copy.

The Gutenberg 42-line Bible is properly called a rare book. However, in a strict sense the term "rare" would be confined to those books which are known in only one or two, possibly three, copies. However, the term is applied to books which are more common but which are much in demand for collectors and for libraries.

The Gutenberg Bible embraced 600 leaves. Probably one hundred copies were printed and of these about thirty were printed on vellum. The printing extended over a period of three to five years and during this time some sections were printed twice to take care of an increased demand during the printing.

Unfortunately the tremendous investment necessary to produce the Bible caused Gutenberg financial embarrassment. His pupil, Fust, acquired some of his type and undertook another monumental piece of work which was printed in a limited edition of about twenty copies. This famous Psalter was for use by the choirs. The Psalter is more rare than the Bible; there is no copy in America. A copy of the Psalter would bring today, it is safe to say, seventy-five thousand dollars. Even though printed in large type, the work embraces only the psalms commonly sung, about twenty-three. However, the price would depend upon the fact that the known copies are almost wholly confined to German libraries, as the book was printed particularly for the Cathedral at Mainz and certain church organizations connected therewith.

Any book printed before 1500 is an *incunabulum,* meaning from "the cradle" of printing. There were some twenty thousand books printed before 1500 and it is possible to secure copies as low as fifteen or twenty dollars.

As specimens of printing and valuable from that point of view, the works of the first English printer, William Caxton, are almost as precious as the first works of Gutenberg. There were on the Continent of Europe a score of printers who precede Caxton in time but the products of their presses can be bought for a song (figuratively speaking) compared with the prices brought by Caxton imprints. The first product of the English press was "The Game and Playe of Chesse."

One hundred and fifty years after Caxton began printing, the works of one William Shakespeare, a modest playwright of the sixteenth century, had attained sufficient fame to warrant a folio edition. Of this "first folio," 500 copies were printed to sell at one pound a copy. Of the five hundred copies, not fifty perfect copies survive, but each of these is worth from thirty to fifty thousand dollars, depending upon the condition and the "points." The second folio of 1632 is worth about $3.000, while the third folio (1663-1664) which is far more rare than the first is worth from $5,000 to $10,000. The fourth folio of 1685 is the most complete but it is also the most common and brings at book auctions about $1,000. The separate works of Shakespeare in the first editions are prized as among the greatest book treasures of the world. At a sale in London in April, 1924, a copy of "The Rayse of Lucrece" (London, 1632) brought £1,860 or approximately $9,000. The poor London playwright must feel a little envious of the men who happen to have these early editions of his works.

At the present time in the book auction rooms of New York and London, the two great centers of this business, early works of English literature have risen to unprecedented heights. At the Britwell Court sale, to which reference was made above, a work by Henry Constable, "Diana, The Praises of his Mistress," printed in London, 1592, sold for £2,700 or more than $11,000. This work is really rare in that it is the only copy known. Were three or four more copies of this to be found, the price would doubtless be adversely affected. However, a dozen Shakespeare first folios would be likely to sell as high or higher than ever before. A few years ago Henry E. Huntington, of California, paid more than $75,000 for a copy of Shakespeare's "Venus and Adonis" bound with "The Passionate Pilgrim," both printed in

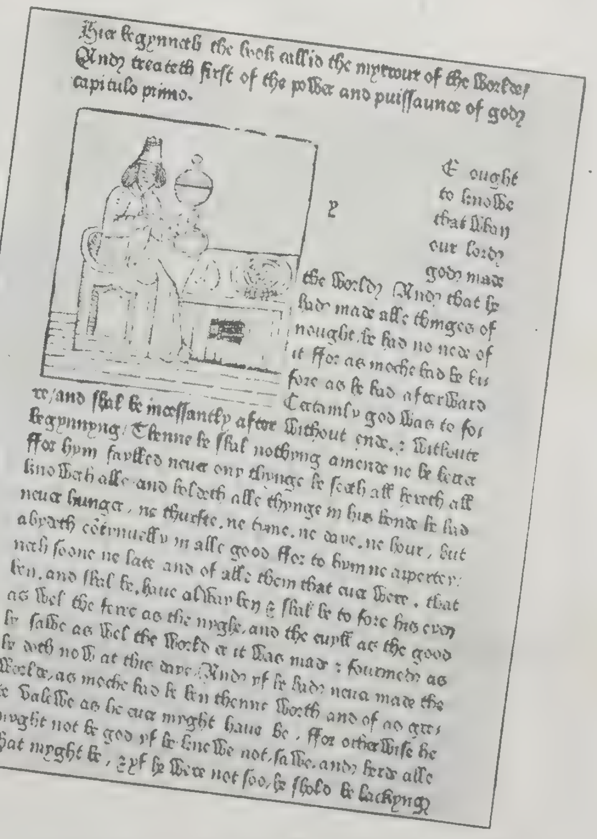
The famous "First Folio" of Shakespeare. One of the cornerstones of any great library on English literature. A fine copy of this work sells for approximately forty thousand dollars.



A Caxton imprint, London, 1483. "The Myrrour of the Worlde"—one of the first books printed in England. The first line reads: "Hier begynneth the book callid the myrrour of the Worlde."

Manhattan Gets the Biggest Shock of Its Life

Weird Phenomenon in Theatrical World Meets Success in City's Slums; An Experiment in Popular Entertaining Which Tells Its Own Story

By PETER SCHUYLER

A WEIRD phenomenon has startled the theater world of Manhattan. In an out-of-the-way showhouse, in the thick of the city's slums, and unconnected with any press-agent ballyhoo, there is being given a show that is worth not only the admission charged for it, but a sum considerably in excess of that amount. The theater is the Neighborhood Playhouse, an adjunct of the Henry Street Settlement, situated on Grand street a few short blocks from East River. The show is called "The Grand Street Follies." The top price for the best orchestra seat is one dollar and fifty cents!

Anyone who has paid from five to fifteen dollars for witnessing Florenz Ziegfeld's "Follies," George White's "Scandals," or Earl Carroll's "Vanities" will have difficulty in accepting the statement that for one dollar and fifty cents it is possible to see a show in which there is more genuine merit, fun, and novelty than in all these combined. Nevertheless, it is an indubitable fact that such a unique situation exists. As if to prove that the gentleman was right who said, "If you built a better rat trap than anyone else in the world mankind would make a path to your door," the Neighborhood Playhouse is packed to suffocation at every performance, while uptown Manhattan's show-center theaters, offering entertainment of the same type as "The Grand Street Follies," are closing on account of poor business.

Must Be Some Good Reason

WHEN the inconvenience attending a visit to the settlement theater is taken into consideration, the fact that for the first time in its history the Neighborhood Playhouse is listed among the attractions in the ticket speculators' agencies, the most skeptical show-goer must realize there is some good reason for such a condition.

It involves a smelly, clothes-destroying, temper-ruining trip in the subway to reach Grand street, no matter what section of Manhattan one comes from. Then a haphazard trolley car carries you leisurely across town, picking its way through the pushcart market, banging its gong past the swarming tenements of Mulberry, Clinton and Essex streets, creeping by the crooked, tortuous alley labeled "Attorney Street," and landing you out at the once white door of the slum theater.

There was a time when inexperienced visitors to the Neighborhood Playhouse had to look sharply or they would be carried past the theater, so unattractive is its front. Not now! It has reached a position of such importance in the life of Grand street that it rivals the fame of the lady who once told fortunes in the heart of Brownsville's ghetto. So widespread grew the reputation of this seeress and so large her clientele that the conductor of the car which passed the street on which she resided automatically pulled the bell when he reached her corner. Instead of announcing the name of the street to his passengers he simply bawled "Fortune teller!" and everyone got out.

Where the People Get Off

IT IS just the same on the Grand street trolley cars going east these nights. When they arrive in front of the Neighborhood Playhouse the conductor stops and yells "The-ayter!" and everyone gets out. All the rancid odors of the street, the pushcarts, the crowded sidewalks, the peddlers of sliced watermelon, the noise and the discomfort of the theater itself cannot keep customers away from the Neighborhood. Manhattan has learned slowly but surely that here is to be found a real entertainment which can be enjoyed for just about what it costs to see a super-special motion picture monstrosity from the gallery of a film theater on The Great Shine Way. That accounts for the jam of taxicabs in front of the Neighborhood every night when "The Grand Street Follies" rings down.

It is a long distance for the gentry who keep the ticket speculators in business to go for amusement. A large proportion of those who consider it an honor to pay extortionate prices for the shows of Ziegfeld, White, Carroll and the Shuberts clawed their way to affluence from the malodorous slums which surround the Neighborhood Playhouse. It was not easy to get them back in the old environment even for an evening, but back they have gone, braving the terrors of memory, just to see a good show at one dollar and fifty cents a smash. Manhattan's "spenders" certainly like to get their money's worth.

One of the extraordinary features connected with "The Grand Street Follies" is that its success is in nowise due to uncleanness. "Artists and Models" made the biggest financial clean-up the Shuberts ever enjoyed; but even Manhattan gasped. Many other Broadway "hits" went the police limit in dialog, dressing, and dirt. None of that in the show at the Neighborhood Playhouse. Not only is there no appeal made to the degenerate appetite but, what is even more remarkable, the program is crammed full of cleverness, true burlesque, and intelligent satire. Even that combination cannot keep "The Grand Street Follies" from being an artistic, financial, and theatrical success.

A Laugh-Compelling Satire

IT IS a strange commentary on the condition of the Manhattan stage that the only worth-while musical entertainment in the city, the only show in town whose book and lyrics is even a degree above the gutter, and the solitary example of what brains and a true sense of fun can accomplish, should be born in a slum, and brought up by people whose connection with the theater world is essentially philanthropic. The hit of Manhattan's summer season presented in a settlement showhouse! The cleanest, brightest, funniest piece in Manhattan played by semi-professionals to packed houses for one dollar and fifty cents a ticket! No wonder uptown theater owners have been pleading with the Neighborhood company to come to Broadway. But the Neighborhood company replies in unison, "Not much! We'll stay here where we are among friends. We don't get a lot of money but we have a lot of fun!"

From beginning to end the review is a laugh-compelling satire on all the fakes of the show business; dramatic critics, money-mad producers, "little theater" poseurs, attitudinizing actors, and musical bunco-steerers. The only slow moments in the evening are contained in a burlesque of Gilbert and Sullivan's "Iolanthe" with Teapot Dome for its background. Even that has many excellent lines and the sense of weakness it leaves is due to the subject and comparison with the other numbers.

For unadulterated, hilarious burlesque played with the necessary touch of seriousness, keen as a razor edge in dialog, bright as a new coin in idea, and unspoiled by any coarseness, theatrical Manhattan will go a long way before it beats "Sinfonica Domestica Triangula" and "Who Killed the Ghost?" The first is a slam at the composers of impressionistic musical twaddle and is so broad in its treatment that anyone who has the slightest gift of humor can appreciate it.

The second is a little more difficult of complete enjoyment for those who do not follow closely the eccentricities of the local stage. It is a roaring burlesque on the school of Shakespearean interpretation as typified by Manhattan's two best-known exponents of modernism in the mechanics of play presentation—Arthur Hopkins and the Theater Guild. The former stages the plays of William Shakespeare as if they were the plays of Arthur Hopkins; the latter manages to crowd a long flight of stairs into almost everything it offers to the paying public. If the Guild ever produces "Uncle Tom's Cabin" it is a foregone conclusion that Little Eva will go to heaven by climbing a staircase of at least one hundred and fifty steps.

"Who Killed the Ghost?"

WHEN Mr. Hopkins two seasons ago produced "Hamlet," with John Barrymore in the title rôle, he established the brilliant precedent of having the ghost played by the spotlight instead of a flesh-and-blood actor. Agnes Morgan, who wrote the book and lyrics of the Grand street show, has hit up Mr. Hopkins' vagaries with a vigor that is most effective. She has taken the most celebrated characters in the Shakespearean gallery and put them all into one Hopkinsonian gumbo. On the battlements of Elsinore she piles all the nightmare contraptions of the Theater Guild's stairway madness and then trots out Shakespeare's characters, done after the Hopkins theory of making the Bard of Avon snappy.

Imitators of well-known performers play the parts. Gallagher and Shean are the two gravediggers from "Hamlet," Pola Negri and Valentino (at their vampiest) are the player king and queen from the same play, Fanny Brice is "Ophelia." Lady Macbeth, Shylock, and Juliet are inserted to make the plot. Manhattan has seen nothing approaching the perfect tomfoolery of "Who Killed the Ghost?" since the Weber and Fields. Even they had nothing half so cleverly written.

Two uncommonly entertaining single numbers are made part of the program. One is a straight imitation of Gertrude Lawrence, the lovely English comedienne in "Charlot's Revue," done by Aline MacMahon. The other is a comic copy of Elsie Janis in all the glory of her stage tricks done with skill as exact as Miss Janis' own, by Dan Walker. Playgoers have felt for a long time that Miss Janis had about played to the limit her services as an over-sea entertainer during the war. Mr. Waiker administers the finishing stroke to that silly and unworthy capitalization by showing Miss Janis doing her favorite cartwheels wearing a pair of red, white and blue knickers. Burlesque can go no further than that!

But if the Neighborhood Playhouse has departed from the established custom of Manhattan's "little theater" movement and giving a good show at such astonishing prices, the city's two remaining groups devoted to high art and low salaries still cling to the idea that native trash and imported muck are the only things worth doing.

Aided by a hullabaloo in the newspapers that resembled in every particular the "smoking up" of a fake prize fight, the Provincetown Players staged Eugene O'Neill's latest bid for notoriety, "All God's Chillun Got Wings." But nothing could keep the thing alive and it passed out while the Democratic National Convention was performing in Madison Square Garden.

Justified Their Existence

THE Theater Guild has produced "Fata Morgana," one of the few plays which has succeeded in lasting through the early summer. This "comedy" was first produced on the Guild's mother stage in the Garrick Theater, whence, having created a money-attracting odor, it was moved up into the Tenderloin so that its full flavor might reach a larger number of nostrils. Now it appears to have settled down for a very torrid stay at the Lyceum.

Those who still cling to the idea that the hope of the American stage lies in the "little theater movement" should see at once "The Grand Street Follies." It is the only effort made by any of the Manhattan theatrical uplifters in many a long day that is worth going across the street to see.

The Provincetown Players have done something for the native theater by giving Eugene O'Neill his chance. Whether he is the genius his admirers proclaim him is not under consideration. He is a dramatist of power, talent, and potentiality. Good or bad, the Provincetown Players gave him, a young, unknown American writer, an opportunity. They have brought out a Negro actor of ability in Charles Gilpin. The Neighborhood Playhouse has developed one or two promising youths, particularly Albert Carroll, who should go far. In these cases, at least, the Provincetown Players and the Neighborhood Playhouse have justified their existence.

The Theater Guild's Efforts

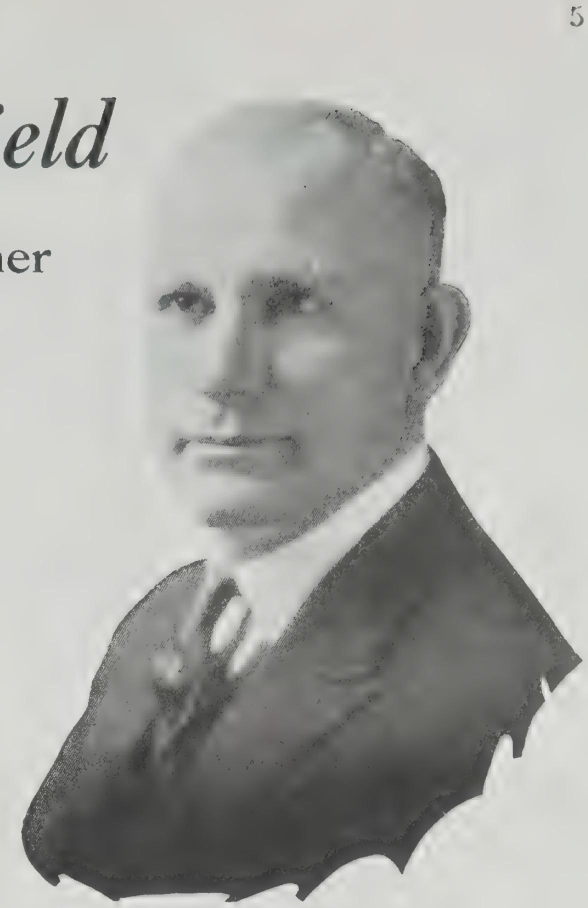
THE Theater Guild, which is the oldest, most press-agented and affluent of all the "little theater" bodies in Manhattan, has done nothing for anybody except the small group of Jewish "intellectuals" which runs it through the board of managers. As now constituted it cannot point to a single young American playwright whose genius it has brought to the light of public knowledge. It cannot produce the name of one young actor or actress in whom it has seen possibilities, to whom it has given a chance for development, whom it has trained and turned out a first-class handicraftsman. The American theater is not one whit better artistically, dramatically, or morally for its existence.

The native stage points with pride to the fact that it has staged two of G. Bernard Shaw's plays, as if that mattered. Two things it has done, however: It has accumulated enough money to build a new theater for itself, and it has given good jobs, either as actors, scenery designers, playwrights or stage directors, to the gentlemen and ladies who make up the board of managers. For which no one can blame anyone, least of all the board of managers.

Sapiro Invades the Tobacco Field

What Will-o'-the-Wisp Marketing Costs the Farmer

By ROBERT MORGAN



JOSEPH PASSONNEAU,
Colorado State Market Director, formerly organizer of the Kentucky Tobacco Growers' Co-operatives under Aaron Sapiro. When he learned Sapiro's methods, Passonneau resigned.

AS THE reader may have gathered from this series of articles, financial loss and often actual disaster come sooner or later to the American farmer who has allied himself with the Sapiro Plan of co-operative marketing. Except in such infrequent examples as that of the Colorado potato-growers, who saved themselves, and the Oregon hop-growers, who were rescued by their non-co-operative fellow-growers, the stories of the associations which have been based on the plan devised, introduced and imposed on the agriculturists by Aaron Sapiro, are uniformly disastrous to the non-Jewish member. The methods of organization and operation are virtually the same in principle, though sometimes camouflaged as to external appearances, in all the associations. These principles are fundamentally unsound because they are based on permanent price-fixing in defiance of the demands of the consumers, and because the associations are controlled and directed by men who in the majority of cases know nothing of the production of the particular agricultural product which they pretend to sell.

Burley Growers Paid in 1924 for Crop They Delivered Two Years Ago.

MEMBERS of the Burley Tobacco Growers' Co-operative Association of Cabell County, West Virginia, a Sapiro organized and controlled association, received, on April 26, 1924, the final payment on 36 of the 52 grades of tobacco they delivered to this Sapiro-Plan association in 1922.

On the other 16 grades of tobacco delivered from the 1922 crop, final payment will be made "when the tobacco still in the hands of the association has been sold."

Meanwhile, these growers have received nothing for their 1923 crop, which is filling the warehouses to overflowing, with the 1924 crop coming on this autumn.

Aaron Sapiro, who organized the tobacco growers, is at this writing in Europe with Judge Bingham, the man who called the Jewish attorney into the tobacco country. He has announced that he is in Europe to "find warehouse space for the storage of the American tobacco crop." And while the members of the co-operative associations wait for payment for their 1922 and 1923 crops, the growers outside the association have been paid in full, the majority of them receiving more net per pound than the members of the co-operatives.

But the particular operations by which the farmers within these associations fail to receive the pay for their labor differ with the different products which these organizations are supposed to market. It has been shown that the method applied to the California prune-growers was a combination of barefaced robbery and of incompetence. It has been told rather plainly in the story of the wheat-growers of the Pacific Northwest that ignorance of wheat-growing, wheat distribution and wheat marketing were responsible for the losses and failures. With the potato-growers of Colorado, it was trickery, thwarted by four Americans, which brought these agriculturists to the verge of ruin. In all these associations there is added to these factors of failure the tremendous operating costs which Sapiro, Rubinow and the rest of the Jewish ring impose on the farmer. It is stated here as a fact that there never has been a Sapiro Plan co-operative marketing association in which the cost of collection, distribution and sale of the farmers' product was not, and is not, higher than the same costs outside these associations. A large part of this overhead goes to the originators and promoters of the scheme; the larger part, however, goes in the form of salaries to the sometimes misguided, often dishonest, and not infrequently ignorant, "Gentile fronts," who, in executive offices in these associations, maintain the Jews in positions of control over the farmer.

Farmers hauling tobacco crop to warehouses which are already bulging with the product of former seasons.

The Sapiro method of dominating a co-operative marketing association is by attaching to himself at excessively high salaries Gentiles whose nominal "leadership" of such an association will keep Sapiro and others of his kind in possession of control of the organization's affairs. Sapiro uses other methods to bind men to him, as well as financial reward, but the writer would prefer for the moment to leave these to another time. In following his method of rewarding the faithful Gentile until such time as that Gentile is of no further use to him, Sapiro makes the farmer pay the bills. Neither the Sapiro brothers, Baruch, Lasker, the Fleishhacker brothers, Steen, Rubinow, nor any of the other brighter or dimmer lights ever put their hands in their pockets to pay their Gentile henchmen a cent—but they permit these Gentiles to put their hands in the farmers' pockets and pull them out full of money.

In no one of the uniform failures of Sapiro Plan co-operative marketing associations throughout this country has this high cost of Gentile fronts for Jewish exploiters of the American farmer been more artfully, or more expensively, carried out than among the tobacco producers of Kentucky. To tell all the details of this exploitation of an industry so that it might become "nationalized" for the financial benefit of international Jewry would require several issues of this magazine The most that can be done here is to present the facts as to the result of the application of the Sapiro Plan to the tobacco-growers of the Blue-Grass and other states. The statements made hereinafter are accurate; the figures given exact, and the story told is a history which it would be well for the agriculturists of the United States to heed.

In 1921, Judge R. W. Bingham, publisher of the Louisville *Courier-Journal* and the Louisville *Times*, launched the idea of the organization of an association among the growers of Burley tobacco. Somewhat later in the same year, the growers of dark tobacco were similarly organized. Thus these associations have been in operation among the growers of Kentucky, Indiana, Ohio, West Virginia and Tennessee for approximately three years. In both associations there are now rather more than 140,000 tobacco growers. The exact number cannot be obtained, because there have been many withdrawals, some additions, while some growers who have been "on the fence" and claimed by the associations have stepped off permanently on the independent side.

Judge Bingham called from California the redoubtable and altruistic Aaron Sapiro, whose avowed purpose in life is to do the farmers good. It was necessary, as it has been in more than forty other states, first to pass a law authorizing the formation of these associations, legalizing the ridiculously one-sided contracts by which the farmer is first thrown, then hog-tied and afterward branded by his Jewish captors, and permitting the Sapiro Plan to "function" in each state. Now the series of events which followed the passage of this law in the five states above mentioned were most striking in Kentucky, largely because of the greater area devoted to tobacco of all varieties, and to the larger number of growers who were led into following the Jewish *fata morgana*.

It is stated by members of these two associations, and by one of the men who was the right hand of the Jewish ring until he learned what was going on, that Aaron Sapiro, for less than two months' work, received $55,845 from the Dark Tobacco Growers' Co-operative Association, and $52,000 from the Burley Tobacco Growers' Co-operative Association as his fees. This sum would pay the salary of the President of the United States for approximately one and one-half years. The writer has studied Mr. Sapiro rather closely, and making all allowances for the cleverness of that gentleman, cannot argue himself into the belief that the astute Aaron is worth as much in two months to the farmers of five states as is the President of this nation in nine times that period. It is my belief that the tobacco-growers of Kentucky and the other states are coming to agree with me.

However, this $107,845, which Mr. Sapiro is reliably reported to have received as his fees for "organizing" the tobacco-growers of two associations, was merely the beginning. Incidentally, Mr. Sapiro is now in Europe, endeavoring to provide *his* tobacco associations with warehouses from which to distribute their crop, the warehouses in Kentucky and the other states being so filled with *unsold tobacco* that the crop must be taken somewhere out of sight of the producers. It may be that Mr. Sapiro will collect another fee when he returns.

When these associations had been "organized," they had to have executives. All Sapiro Plan co-operative marketing associations have lots of executives, supposedly to do the work which half a dozen competent salesmen, working on commission and earning as they produced results, could do with greater success and speed. There were twenty-seven of these executives, ranging from the general manager at $25,000 a year, to the statistician, at $3,600, and drawing a total in salaries from the dark tobacco association alone of $218,800 a year, or, roughly, $600 a day. Each of these executives had assistants drawing pay and doing the work. At one time, these assistants numbered 210, but at this writing, according to the best information obtainable by the writer, they have been reduced to 190. It is interesting to note that the statistician—who drew the lowest salary, a paltry $300 a month—was unknown to Mr. Sapiro until after he had been appointed. It costs the farmer money to know Mr. Sapiro; and it costs executives of farmers' co-operative associations money *not* to know him.

The selection of these executives was an operation full of interest to both the executives and the tobacco-growers, though the latter have just begun to learn how really interesting it was. Mr. W. F. Bradshaw, a banker, of Paducah, Kentucky, was made president of the Dark Tobacco Association, on the urgent recommendation of Mr. Sapiro and Judge Bingham. According to statements made by Judge Bingham, prior to the appointment of Mr. Bradshaw, the judge desired the banker to be governor of Kentucky and believed that, as president of the Dark Tobacco Growers' Co-operative Association, his election could be more easily obtained. Thus and here politics entered into the tobacco situation.

There were three candidates for the positions of secretary, treasurer and accountant. One of them was competent, trained, willing to do his full duty in return for his pay. He was made accountant at $7,200 a year, while one of the others was made secretary at $9,000, and the third treasurer at $8,000. (Names and dates given on application.) Once more, it pays a co-operative executive to know Mr. Sapiro, of San Francisco. Under delightful arrangements which have been made, neither the secretary nor the treasurer has any arduous duties to perform. The accountant has more than he can do.

The secretary was Mr. S. S. Stitt, of Henderson, Kentucky. The treasurer was Mr. R. D. Farmer, of Adams, Tennessee. During the first meeting of the board of directors of the Dark Tobacco Association, Mr. Sapiro presented his bill for $30,000—just a part of his "fee." Immediately, and, according to published statements, without the knowledge of the board of directors, Mr. Bradshaw, president; Mr. Stitt, secretary, and Mr. Farmer, treasurer, gave a note, in the name of the association, to Mr. Sapiro, for $30,000. Judge Bingham with equal celerity purchased this note, which thus passed into the hands of an innocent purchaser. When you have a little time, think over these two paragraphs you have just read. They illuminate the dark tobacco situation.

Among the other interesting appointments—and all twenty-seven of them are interesting, though there is neither time nor space to take up all of them—was that of Mr. Charles Rogers, as associate director of warehouses, at $10,000 a year. In most lines of endeavor,

Two Editors Sprang From Same Ohio Town

Dr. Albert Shaw and Murat Halstead of Shandon; The "Garden of Eden" Where Genius Flourished

By EMERSON ROBINSON

MURAT HALSTEAD
Of the old line of editors whose newspaper was built about his personality.

CALLERS at Shandon House at Hastings-on-the-Hudson often wonder, no doubt, why Dr. Albert Shaw, editor of the *Review of Reviews*, gave the house its name. And no doubt, too, Dr. Shaw has been called upon time and again to explain the name. And it's easy for him, for Shandon is the town in which he was born; it's the town now which holds a strong place in his affections and which, when time permits, he visits to renew old acquaintanceships and tread again the streets and fields over which he romped as a youngster.

Shandon is in Butler County, Ohio, and in one of the richest sections in that rich county. On a picture taken years ago but now so faded that the outline of the fields is barely visible, one of the older residents inscribed "The Garden of Eden," and surely Adam and Eve would not have asked a more delightful spot nor their descendants have sought a better one.

Shandon is proud of her sons who have gone to other cities to exercise the talents which the limits of her own boundaries and opportunities denied; and the "old home town" is like a magnet to them, for it draws them back again and again to get a glimpse of "Paddy's Run."

One of the products of Shandon is Dr. Mark Francis, of College Station, Texas, whose research in medicine for treatment of "cattle fever" has been the means of saving fortunes for Texans and caused Dr. W. O. Thompson, president of Ohio State University at Columbus, to say that "if O. S. U. had done nothing except give to the world Dr. Mark Francis" her mission was worth-while. Ohio State, by the way, is one of the largest universities in America and a tribute such as this for one among the multiple thousands who have attended there has been the latest source of pleasure for the Shandon-ites.

But to add to this came the announcement from Washington of important discoveries in the government laboratory of Dr. Edward Francis, a brother of Dr. Mark—and also a Shandon product.

There is one more whose tempestuous career would fill many pages in even a short history of Shandon—Murat Halstead, whose trenchant pen not only kept a city in an uproar but gave him such fame as few have held in American journalism.

Halstead was an editor when newspaper activities in all departments revolved about the personality of the editor. Success or failure depended on him, and Halstead tasted both. He was born in Shandon in 1829 and in his boyhood days wrote for the old *Intelligencer* at Hamilton, the county seat of Butler. He got his "higher education" at College Hill, a suburb of Cincinnati, and in 1853 became a reporter on the *Commercial*. A few years later he became part owner and in 1865 editor-in-chief and two years later the sole proprietor.

He was a caustic and forceful writer and he used his arts to the fullest prior to and during the Civil War. He was intolerant and impatient and these characteristics were evident in his attacks on politicians and politics, individuals and rival newspapers.

Under his control the *Commercial* soon became the outstanding newspaper in Cincinnati and continued so for many years, even distancing the *Enquirer*, Democratic, under Washington McLean. But John R. McLean, a son of the owner, assumed charge of the *Enquirer* and almost at once made it an independent newspaper and went after subscribers of the *Commercial* and the *Gazette*, the latter a Republican newspaper owned by Richard Smith. Halstead had kept his *Commercial* independent and with advanced ideas on gathering and disseminating news, McLean soon began to make his competition felt by both newspapers.

His final stroke came when he threw open the classified columns of the *Enquirer* free and in a short time, when they found not only their finances but their subscription lists dwindling, the *Commercial* and *Gazette* were forced to consolidate.

Halstead was forced to borrow considerable money, giving stock as security. This came duly to the ears of McLean. When the bank officials felt they had gone the limit for Halstead, McLean agreed, it was reported, to underwrite further loans. Then when Halstead had put up sufficient stock as security the bank foreclosed and McLean took over the *Commercial-Gazette*.

Halstead after this became editor of the Brooklyn *Standard-Union*, a position he held for many years.

Before the war with Spain, he went to Cuba and syndicated letters which were called the "Uncle Tom's Cabin" letters of the war with Spain, when they came on in book form under "The Story of Cuba."

With Halstead's great natural ability was a zeal for work and for his profession which made him the outstanding figure of his time in his field. It was said of him that he wrote more than 3,000 words of editorial matter daily for a hundred days, sometimes exceeding this to as much as 5,000 words. He never thought of an eight-hour day for himself; nor a ten-hour day; more often he worked sixteen and liked it.

Halstead spent the last few years of his life in Cincinnati writing a history and special articles and he died there in 1908.

Halstead never forgot the village of his birth although he never accustomed himself to the name of Shandon. To him it was Paddy's Run, the Paddy's Run of his boyhood, and the name he loved.

The house in which Halstead was born still is standing near Shandon. It is on the farm of Henry H. Robinson, whose wife is a niece of the famous editor and with whom he often visited. It is partly built on a small hill and is located in a beautiful sycamore grove. Every year, even at this late date, many go there to see the shrine and pay silent tribute to Halstead.

It is of interest to note that Dr. Shaw and Mr. Halstead were close friends and more, for they were related. Dr. Shaw's father, Dr. Griffin M. Shaw, was born in Shandon but studied medicine under Dr. Cyrus Falconer at Hamilton, after which he returned to the village. Dr. Shaw's paternal grandmother was Rebecca Halstead, sister to Colonel Griffin Halstead, who was the father of Murat.

Shandon, however, was not always Shandon; neither was it always Paddy's Run; and it was not always New London. For, in all, the village has had three names. Citizens in the pioneer days wanted to attach the name of New London but the postal authorities at Washington refused to permit this because there already was a town and post office by that name in Ohio.

Paddy's Run was the name originally given and the name that still is loved by many of the oldest residents now living there. It brings back pleasant memories of days long past, although they now accept with good grace the new and beautiful name of Shandon.

Above—DR. ALBERT SHAW, editor, *Review of Reviews*. Below—House in which Dr. Albert Shaw was born.

The story has circulated for more than a century that the village took its name from a winding little creek which flows on the outskirts, and the creek got its name from early settlers, because an Irishman drowned in it shortly after taking up his residence in the then almost unbroken wilderness.

This name clung to it until thirty-seven or thirty-eight years ago, when agitation was begun to change it to Shandon.

Girls and boys returning home from college were instigators of the movement. They reported that their fellows in college joshed them so much about Paddy's Run that they were mortified and embarrassed.

"And how would you," ask some of the prominent dwellers there today, "like to give the name of your town as Paddy's Run?" It was a hard question to answer and it took a long time for the voters there to do so. The town was divided into rival camps and the name changed back and forth from Shandon to Paddy's Run, and from Paddy's Run to Shandon until the latter finally won out and now everybody is glad that it did; or almost everybody; there may be a few who like Paddy's Run better than Shandon but most are ready to acknowledge the new name to be the better. So Shandon it shall be called.

In 1801 Edward Bebb bought a half-section of land in what is now Morgan Township, in which Shandon is located. He was one of many immigrants who landed in Philadelphia in 1796 from North Wales. Of the hardy type, he made his first trip on foot across the mountains and into the new land of promise. A few months after he had completed the purchase, Mr. Bebb returned to Ebensburg, Pennsylvania, and there married Mrs. Margaret Owens, formerly Roberts, whom he knew in North Wales, and took his bride down the Ohio to Cincinnati and thence to Morgan Township.

His first son, born on December 8, 1802, became governor of the state of Ohio forty-two years later. He was given the name of William. He was an industrious and studious youngster and learned rapidly. When he was twenty-five years old, after being duly married and having some experience as a teacher, he conceived the idea of opening a boarding school for boys. He obtained a good site on his father's farm and with the aid of his father and some friends in Cincinnati soon had the school going and as many students as he could handle.

But Bebb was ambitious politically and in 1832, he rode to Columbus, the state capital, on horseback, successfully passed the bar examination and returned to Hamilton to practice, abandoning his school.

In 1844 he was elected governor and served during the trying period of the Mexican War when sentiment was much divided as to the justice of the conflict. After his retirement he purchased 5;000 acres of land near Rockford, Illinois, and went there to live. A few years later, during a visit to England, he became interested in some emigrants who desired to come to America and assisted them in the purchase of 100,000 acres of land in Tennessee. The colony, however, did not last long after being established because of the slavery sentiment, and Bebb returned to Illinois.

When President Lincoln was inaugurated, Bebb was named as pension examiner and he held this office until 1869 when he returned again to Illinois. He died in 1873.

Those early settlers were God-fearing people and when "there were a few gathered together" there was a church formed. This was true of Shandon and the settlers formed their first church in 1833. Rev. John W. Browne, of Cincinnati, was chosen as minister and lacking the ecclesiastical formality of ordination, the settlers ordained him themselves. There was no church edifice and the congregation for twenty years met in the scattered cabins, in stores, or the school, or in pleasant weather under the great trees. In 1853 brick was burned for the first edifice; the following year it was inclosed and in 1855 the pulpit and seats or benches installed. This church gave way in later years to a larger one, so far as actual usage for worship was concerned, but the original structure is still standing, a community home, likely to remain standing for another century or more.

In this modern America one often wonders how many young men would walk fourteen miles on a Sunday to preach the Gospel. But in the early thirties there was a student filled with the Spirit, at Miami University, Oxford, and when he was asked to preach at Shandon, he went; it was his calling and it mattered not to him whether he walked or went horseback. He walked, and today Rev. B. W. Chidlaw is a name familiar to every one in Shandon. In 1836 he accepted the pastorate of the church and remained as such for seven years.

Some of the historic old homes are still standing in and near Shandon, but many have given way to the more modern home.

It is not growing in population; it has about 350 residents, probably less than some years ago but everyone in Shandon loves Shandon and those who have left love Shandon also.

Mr. Ford's Page

IT IS sometimes hard to understand the type of mind which succumbs to the fear of super-control in the material world. It is not so difficult to understand the purpose of those who plant that fear. These thrive on disorganization; they have a degenerate dislike for systematic progress; the only way they can exercise their leadership is negatively and destructively. It is bad for society when, as now, so large a part of the vocal leadership is devoted to rousing enmity to such method and order and success as mankind has been able to attain in providing itself with the elements of a living.

We shall deal with the matter of so-called super-control, but first consider the fear of it. What should we most fear?—(that is, if a man should fear anything, which he should not.) Should we fear mental or material control, most? Should we fear most the control of our ideas or the control of the commodities of life? Should we fear the possibility of rulership over our minds and our thoughts and our reason, or the possibility of rulership over lumber and coal and sugar?

> *THE sense of injustice, more than the unjust condition itself, is what wears on men's minds. Given this sense of injustice, even though no unjust condition exists, it is just as bad as if everything was wrong. In our day far too many are engaged in creating a sense of injustice in men's minds without stopping to prove that the unjust condition exists. Men are told that all the commodities of life are monopolized. Prove it! You cannot! Nature forbids monopoly and Human Nature destroys it. Money controls nothing: once it did, but no longer. Business controls nothing, but is absolutely controlled by popular reaction to the service it renders. Challenge the creators of fear and suspicion. Make them produce their facts, and line up their facts alongside daily life as you know it.*

Because, it is worth while knowing, there is ten thousand times more control exercised over what people think than over what they eat or wear or use. To an astonishingly large degree mankind has won economic freedom, that is, Nature has always been on the preventive side of economic freedom ever being seriously endangered or completely lost. But mankind is still at the mercy of gusts and storms of false thought which create for the mind false worlds and fill the heart of man with fears and suspicions that have no basis in natural and normal fact.

So that it doesn't really matter whether such super-control over the commodities of life as is charged exists or not; if men are told that it exists, if they believe that it exists, if they yield to the fears which the contemplation of it create, then the real super-control is in the idea thus planted, it is in the hands of the planter of such ideas, and nowhere else.

The only enslavement possible to man is the enslavement of his mind by false ideas. Every other avenue is open and free. The very laws of Nature and Human Nature make any other kind of enslavement impossible.

Twenty-five years ago we heard a great deal about Big Business. Well, as has been said before on this page, there was really no Big Business twenty-five years ago. What we had was our first mergers of money. Money is not business. Big Money cannot make Big Business. Men of money, foreseeing the approach of the Industrial Era, sought to seize and control it by means of their pooled capital. And for a time the country rang with their exploits, but the tale was mostly one of failures. Money brokers are seldom good business men. Speculators cannot create values. However, the idea got abroad that "money" had grabbed everything and that "money" controlled everything.

One has only to go back in mind twenty-five years and count the big businesses existing now which did not exist then, which Big Money did not bring into existence, and which Big Money does not now control, to see how faulty the assumption is we live under a super-control of all the more needful commodities of life.

That is, as regards the fact. It is equally true as regards the possibility for the future. There is, indeed, a money trust. That has been proved. For centuries, with marvelous forethought, certain hereditary groups have manipulated a large part of the gold of the world, not all of it, but the balance of power, especially in Europe, where they have used their power to make war or peace. Their power is not in their gold, because there is no power in gold; their power is in their control of people's ideas with regard to gold. It isn't the people's enslavement to gold that constitutes the fact, but their enslavement to a certain idea of gold, which idea was invented and is perpetuated by the principal owners of the world's gold. Control of the mind, again, you see. More than that, is this group's control of the methods of business. They have invented most of them. The methods of business constitute the rules of the game and give the inventor of those rules an advantage. Young business men, instead of studying the present rules of the game, should first study what is the main purpose of business and then study whether the present methods of business guarantee that purpose.

That kind of control does exist, money control. Not, please understand, the control of mankind by money, but the control of money by a group of money-brokers. And at one time this was very serious for the world. For at one time it meant the control of mankind by money. Not any longer however. For money is an inert thing. And when Industry came, and wealth began to find its true base and standard, money slowly receded to its proper place as one of the cogs in the wheel, not as *the* cog or *the* wheel itself. That is to say, the time came when even the money brokers found that their money was inert, dead, until the worker could be persuaded to use it. The worker made it necessary for so much more money to be made than all that the money brokers had, that today there are vast amounts of uncontrolled money, and the money trust with the money it controls is of consequence to speculators and gamblers only whose raw material, stock in trade and aim in life was money and money only.

The money trust does not control the worker, the creator, the man who with hand or brain serves society in a productive capacity.

But doesn't money control wheat, coal, and other essentials of life? How can it?—it doesn't create them. There are twice as many coal mines open as we can possibly use. Until a little while ago wheat was a drug on the market. Money doesn't own the coal in the United States. Money doesn't own the farms or the farmers. Money, following its traditional policy, would make coal scarce; here we have it too plentiful. Money would make wheat scarce; the world is piled with wheat.

What is the trouble then? Lack of business methods in coal and wheat. Coal is Big Business, but unorganized. So is wheat. Millers know how to organize their business so that flour can be supplied to all parts of the country, but coal operators apparently do not. They are learning, however. You can always go out and buy an automobile, but you cannot always go out and buy a ton of coal; yet proportionate to the need, the ready supply of coal is greater than the ready supply of automobiles. It isn't a matter of money control, it is a matter of wise method and system of business.

Super-control of commodities seems an impossibility among an enlightened and resourceful people. A people that would not stand a tax on tea—would they stand absolute, despotic control of the things they need for life? A people that freed their slaves —would they turn slaves themselves? The pin-maker is permitted to make pins as long as they are good pins. If not, someone else will make them. The real controller is the Public.

"But there is Big Business." Certainly. But it is *business.* It is something that goes along in response to a demand, and the demand is created by a service rendered. Stop the service, and the demand ceases; stop the demand, and where is your Big Business? All the money in the world could not stop competition among Americans. To do one thing well stimulates others to do it better. It is the genius of the race; who can control *that?*

Business grows big by public demand. But it never gets bigger than the demand. It cannot control or force the demand. There is no super-control save that of the people reacting in kind to the kind of service they get.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"Mobilization Day"

THE miscalled "Mobilization Day," set for September 12, has received much unexpected advertising. Governor Bryan, of Nebraska, went off at half-cock declaring he would do no such thing, and next day innocently inquired what thing. Others have trembled with terror at the horrific effect the day is likely to have on the nations of Europe. But millions—the greater part of the people—are asking what it is about.

Instead of exciting terror in the nations, we are more likely to excite their risibilities by what we try to do September 12. At the close of the war our Army authorities agreed to a reduction of the Army to 150,000 men and 13,000 officers. Congress reduced the Army to about 125,000. This force drills nearly every day of the week—think of it! The National Guard drills once a week or so—think of that! And the Navy mobilizes once a year—heavens! We have no military force whatever, as forces go. We have the merest skeleton organization, and it is that organization which is to be tried out on paper, September 12.

Of course, if testing the village fire department in a practice drill is likely to set the village on fire, let us keep the fire department under lock and key; but if practice is necessary to keep Dick Smith from entangling himself in the hose and to teach John Long his place at the ropes, let's practice.

Japan is at this moment holding actual army maneuvers, yet the world does not tremble. Last year France mobilized her whole disposable force on the Swiss frontier, yet Italy was not afraid. Today the British Empire holds a million armed men. France has a standing army of 720,000, and has trained 2,000,000 men under twenty-five years of age since the Armistice. Russia has a million and a half men constantly under arms. Opposed to this is the insignificant number of 125,000 men maintained by the United States. And yet there are those who say that for the citizen members of the skeleton military organization of the United States to assemble on September 12, is to rattle a sword in the face of the world.

And whence does much of this cry arise? From those whose spiritual mother is Russian Communism—and Russia today is the greatest militaristic state in the world. Russia, under Bolshevism, maintains a system of compulsory military training from sixteen to eighteen years of age; and a preconscription training from eighteen to twenty years of age; actual army service from twenty to twenty-four years of age; after which every man is transferred to the reserve for supplementary training.

It is the agents of this Russian militarism who will object most noisily to the American trying out their fire-lines on September 12. They ask us to recognize Russia and the largest army on earth, but they object to American volunteers marching down Main street.

The purpose of September 12 is the same as that of the training camps which have been going on all summer, without objection. The difference is that it is intended for citizens and lasts but one day. It is in effect to do some of the things which various committees would have to do in time of national danger. Our military machinery is so attenuated, we are on so complete a peace footing, that it is desirable to try out what we have and, important also, to explain to the people just what our military resources amount to. Of our 13,000 army officers, fully 6,000 have been engaged in citizen instruction, and September 12 is to be a test of the efficiency of their work.

There is no general call of citizens to leave their employment. It was the special wish of the Department not to call a general holiday so soon after Labor Day. There is no compulsion exerted anywhere, except upon the regular forces of the United States, the governors of the states being requested to summon the state military forces. Citizens are invited to observe or participate, to become informed as to the things that would be necessary for national defense—just as they are shown in public buildings the way of escape in case of fire. The expense has been minimized by the spirit of volunteer service which will actuate the reserve forces. Committees will meet to consider what they would have to do in case of national emergency. And we predict that all governors, including Governor Bryan, will do what the Government suggests, that millions of citizens will participate, and that Europe will smile to see how perfectly efficient we are in everything except peace-time soldiering.

Broadly, are we not setting an example to Europe? Are we not showing them, by the plans for September 12, that it is possible to be defended without being crushed under the burden of military establishments? Though militaristic Europe may smile, may she not also be led to think?

The Tribune Gets a Fast One

THE Chicago *Tribune* proposed to fill private homes, hospitals, hotels and offices with the complete details of the Loeb-Leopold murder trial, radioed from the courtroom. It put its proposal in the form of a printed ballot on which it invited its readers to indicate their opinion of the suggestion.

The answer was an uncompromising NO, to the very evident confusion of the Chicago *Tribune*.

About the only time the readers of that paper can show their disgust with its policies is at elections, when they vote squarely against *Tribune* counsel. But this time the *Tribune* handed them an opportunity to vote against an enterprising project of the paper itself, and they did.

When it is conceived what it would have meant to have a powerful broadcasting station pouring into the air and into tens of thousands of receivers the horrible details of a most loathsome crime, and all the methods which the state must use to reach approximate justice, then one must say that universal poison gas, promised for the next war, is already a reality: The Chicago *Tribune* was ready to deluge its whole territory through receivers in orphanages and nurseries and Boy Scout centers, with the poison gas of the new decadence.

After its defeat, which it attempted to mitigate in a one and a half column editorial, the *Tribune* argued that a trial is a public matter anyway and that it is only a matter of time when trials will be broadcast. Then our radio programs will doubtless carry schedules like this: "Station WGN: 7 a. m. Early Morning Police Court. 9 a. m. The Franks Murder Case. 11 a. m. Preliminary Testimony of the Mistress of Millionaire Lobelski of an Attack Made on Her. Noon: Crime reports from all cities in the United States. 2 p. m. Divorce Court proceedings. 4 p. m. Late Afternoon Third Degree at Police Headquarters. All Night—Bulletins from reporters on the crime beat."

A court trial is a public matter already. There is no secrecy about it. But the editor of the *Tribune* does not park his wife and family in courtrooms for an afternoon's diversion. What reason had he to suspect that other wives and families have lower tastes in this respect? It may be that he has listened so long to the common editorial excuse that "we fill our papers with crime and confusion because the public demand it," that he has come to believe it true.

The public don't have a chance to say by printed ballot every day what they want in their newspapers, but they did say what they wanted in radio—

And the result proved that the taste of its readers was higher than that of "the world's greatest newspaper."

There may be a lesson in that for all newspapers. Anyhow, we commend it to teachers in schools of journalism as a significant fact to be passed on to all fledgling reporters and editors.

The *Tribune* editorial will live long as a case of blind staggers. Criminal trials are public, it cries. So they are. Clinics in the city's hospital are public, too. Even around the article of birth the law throws its claims to publicity—but not by radio! If the Chicago *Tribune,* in its spirit of so-called enterprise, ever begins to pour into the homes of the Middle West what it proposed to do in the Loeb-Leopold murder trial, we predict that Station WGN will permanently sign off.

Since the decisive negative vote of its readers, however, it is not likely to attempt such a maneuver.

American Women, Attention!

IN THE Senate Chamber of the United States, on May 31, 1924, Senator King, speaking about the proposed so-called "Child Labor Amendment" to the Constitution, said:

"Every Bolshevik, every extreme Communist, and Socialist in the United States is back of this measure. The Bolsheviks of Russia were familiar with the scheme that was about to be launched to amend our Constitution. In conversation with one of the leading Bolsheviks in the city of Moscow, one of the educators, when I was there last September and October, I was remonstrating with him about the scheme of the Bolsheviks to have the state take charge of the children. 'Why,' said he, 'you are coming to that,' and he called my attention to the statutes in many of the states in regard to compulsory education. Then he said, 'A number of Socialists in the United States (and he mentioned a number of names, but I shall not mention them here) are back of the movement to amend your Constitution of the United States, and it will be amended, and you will transfer to the Federal Government the power which the Bolshevik government is asserting now over the young people of the state.'

"Of course, this is a Communistic Bolshevistic scheme, and a lot of good people, misled, are accepting it, not knowing the evil consequences which will result and the sinister purposes back of the measure."

About the only way to mislead an American is to appeal to his humanitarianism. It is the surest way to mislead the American woman.

But it is time for some one to arise in this land and speak a word for the Constitution of the United States, which has become the playground of all the faddists, and worse, in the country. When we amend the Constitution so much that half the people shall revolt against the amendments, we have created precisely the condition which the enemies of this country desire.

The Constitution should be amended only for the enlargement of liberty, not for the centralization of power in the hands of a body of Socialistic and Communistic women living at the Capitol at Washington.

It is stated in the *Congressional Record* of May 31, 1924, that the person who drafted the Constitutional Amendment now proposed to the people of the United States is Mrs. Florence Kelley (formerly Wischnewetsky), a professional Socialist; translator of Marx; editor of the *Archiv fur Sozialegesetzgebung,* at Berlin; president of the Intercollegiate Socialist League in the United States.

The women of the United States don't know these facts about Florence Kelley Wischnewetsky, yet they are being practically led by Florence Kelley in making another dent in the Constitution of the United States.

Why is it?

Because the women of the United States are homemaking, while with infinite ramifications from Germany and Russia, and with plenty of funds with which to operate, a group of hard experienced revolutionaries at the Capitol of the United States is using the humanitarian instinct of American women to work ulterior ends.

No wonder it is reported that President Coolidge would not come out against big campaign funds. He is reported as saying: "There are enemy agencies here in Washington who spend every six months more than all the parties spend in four years. If campaign funds are political educational funds, we certainly need the education."

At any rate, Americans are not going to have their Constitution amended from Moscow, if they know it.

One Year of Coolidge

AT THE beginning of August, Calvin Coolidge completed his first year as President. Suddenly elevated to his high office by the death of President Harding, he entered as a quantity almost unknown to the nation at large. His conduct as Vice-President had been meticulously modest. He knew his place and kept it. His new eminence did not change his nature but made his duties necessarily more public, the scrutiny of him more severe. Without noise or publicity-seeking activity, he took up his task, and his method of letting the country know him was to let hundreds upon hundreds of citizens meet him and form their own opinions. From these it soon spread abroad that Calvin Coolidge was a man of character and purpose, a strong, quiet personality, a President who could be depended on to steer a straight course. This opinion, first expressed by a few hundreds, has been confirmed by the nation's observation of the man. In a short year he has not only become known, he has become trusted. This in itself is no small achievement.

Canada's Long Fight for Prohibition

Question to Be Reopened by Ontario Government Plebiscite

By FREDERIC T. YEALLAND

The Ontario Government has decided that a plebiscite on prohibition is demanded by the people, and has fixed October 23 as the day of voting. It has not, however, announced the form of questions to be presented, but promises information on that point in September.

IT IS a matter of history, though a fact not generally known, that Canada was nearer to nation-wide prohibition seventy years ago than it has been at any time since. In 1854 a bill was introduced in the old Parliament of Canada—then composed of two provinces now known as Ontario and Quebec—giving to the country total prohibition of the manufacture, importation and sale of intoxicating liquors, and it came within a very few votes of adoption.

Those engaged in the traffic, realizing the narrow escape their trade had had, determined that never again should it be in such danger, and from that time until the beginning of the World War they were successful in combating the repeated attacks of the enemies of their business.

The efforts of the prohibition workers during all these years were not without some success, however. There has been prohibition in spots, in the form of local option.

First came the Dunkin Act in the early days of confederation. This enabled the people of a county to vote on the question of the abolition of the drink traffic therein. It, however, was not satisfactory to the temperance people, being far from workable. Then followed the Canada temperance act, which was more to their liking. But, although this measure was put into operation by the people of a number of districts, the temperance people wanted more; Dominion-wide prohibition was what they aimed at.

First Ontario Plebiscite

IT SHOULD be stated that there is a division of authority in Canada in the matter of liquor legislation; the Dominion Government has to do with manufacture and importation; the power of the Provincial Government is limited to the traffic within the limits of the provincial boundaries.

Finding that no more could be got from the federal authorities, the leaders of the prohibition movement finally turned to the provincial governments, and in Ontario and some of the other provinces a local option law was enacted. This measure enabled a municipality or group of them to vote on the question of prohibition within it or them. This was taken advantage of by many of the towns and townships of the province, in spite of the fact that to pass it required that two-thirds of the votes polled must be favorable. This feature was vigorously opposed by the temperance people, who claimed that a majority vote should be sufficient to carry. The answer given to this was that to insure its successful operation there must be a substantial public sentiment behind the measure.

But this local option was limited to a three-year period, at the end of which another vote, if demanded, must be taken. The result of the second appeal was repeal of the law in many places that had adopted it. The reason was apparent enough, for how could a local option community keep sober when surrounded by others where liquor was to be had in abundance? Not only did the thirsty of local option districts go to neighboring places to fill up, but they brought back with them a supply for the immediate future. The coming of the World War found very few districts under this local option.

Persistent agitation resulted in the taking of the first plebiscite on prohibition in Ontario in 1894, which, *in spite of a favorable vote of 92,000 majority, resulted in nothing,* some hidden influence preventing the government of the day—although its leader was a professed prohibitionist—from implementing the promise to abide by the result of the vote.

Weak Spots in Temperance Act

FOLLOWING this came the Dominion plebiscite in 1898, the government of the day having yielded to the popular demand. In this a tremendous majority was given, that of Ontario alone amounting to 108.000. However, Quebec Province gave a big contrary majority, which cut down the total materially, but still left a substantial favorable majority. *Here again nothing tangible came of the vote,* the government fearing, evidently, to antagonize Quebec Province, which was so strong against prohibition.

In 1902 the Liberal government of Ontario submitted a prohibition measure in a referendum, which *carried by a plurality of 96,000. Notwithstanding this, the measure was never put into force,* which was the greatest disappointment the temperance forces had yet met, the then prime minister, Hon. G. W. Ross, having always been regarded as one of the staunchest advocates of prohibition.

All the while the liquor interest was much disturbed. The men in the business viewed these big prohibition votes with no little alarm and they felt that defiance of the popular will could not continue forever, nor did the fact that cities were continually voting favorably for license reduction lessen their anxiety. Hence it was that they decided to make themselves an important political power.

The result of this was seen in the provincial election of 1911. The liberal party, under the leadership of Mr. Rowell, long known as a prohibition leader, entered the contest with "Abolish the bar" as its rallying cry. Of course there was only one side for the liquor people to take, and to their joining forces with the Conservatives was largely due the victory of that party at the polls.

There was, therefore, something like irony in the fact that it fell to the lot of a Conservative government, those supposed friends of the liquor trade, to introduce and secure the passage of a prohibition bill as a wartime measure. Sir James Whitney, the premier, a strong opponent of prohibition and author of the objectionable three-fifths clause of the local option bill, had died before the war came, and many people believe that if he had lived even war would not have induced him to propose such a course. Mr. Hearst, who succeeded Sir James as the government leader, was right in sympathy with the prohibition movement, but not so strongly as to cause him to compromise his party with it. It was not until after he had sounded his following in the legislature that he consented to the introduction as a government measure of the Ontario Temperance Act. He found the Liberal opposition ready to assist in the passage of the bill, which was a copy of the Manitoba Act, and the Ontario Temperance Act soon became a law of the province, the understanding being that as soon as the war ended and the Canadian soldiers came home the act would be submitted to the electorate of the province by referendum.

In 1916 the Ontario Temperance Act was passed, but it was not long before weak spots were discovered in it, the chief of which was what was known as "cross-circuiting." A man in want of a case or more of whisky, living, say, in Walkerville, would send by wire or mail to an agent at Montreal, Buffalo, or some other distant point, from whence the order would be dispatched to Walkerville and the goods would be speedily delivered at the home of the thirsty one. This plan was followed by people all over the province, and as far as they were concerned prohibition was a farce.

The provincial authority was powerless to prevent this, and appeal was made to federal government. The outcome was that a referendum prohibiting interprovincial traffic in liquor was submitted and indorsed by the people and the worse leak in the O. T. A. was stopped.

Farmers for Prohibition

IN 1919, the war having ended and the Canadian soldier survivors having returned home the promised provincial referendum on the O. T. A. was submitted and the act was sustained by the great majority of 407,000 votes, the electors at the same time rejecting by substantial pluralities government sale and bar and wine licenses. This is a most interesting sidelight on the charge that ex-service men would, on their return, vote liquor back into power.

The claim has been advanced that if prohibition can be kept out of politics it will be safe. Plebiscite and the referenda taken on the question certainly give strength to this claim. But to keep it out of politics is the difficulty. The fall of two governments since 1916 is ascribed to this very question.

When the Hearst Government appealed to the people in the next general election the fine hand of the anti-prohibitionist was seen in the result. The antis were determined to punish the Conservatives for what they called their betrayal of the liquor trade after the united support it had given them in the "abolish-the-bar" contest. The Liberals the trade regarded as its natural enemy, and the only way it could chasten the treacherous Conservatives without helping the Liberals was by throwing its united strength with the newly formed Farmers' party, which accounts in no small measure for the return of the latter to power, which they held for the full four-year term.

Again was the hand of the "moderation league," at first known as the "liberty league," seen in the general election of last year. The farmer Government had been more vigorous in its enforcement of prohibition than its predecessor and it held out no hope whatever of either repeal of the O. T. A. or another vote on it. The attitude of the Conservative leaders was that as the act had been endorsed by the people, if it is repealed it must be by the people. This gave the antis a ray of hope that the return of the Conservatives to power would mean another chance to place Ontario in the wet column. Anyway, the Conservatives had been well punished and they should be given another chance. That the antis viewed the matter in this way was shown by the return of the Conservatives to power by a majority over Liberals and Farmers of about forty.

Plebiscite in October

THAT there would be another vote on the question this year was considered certain, and not without reason. In the two last legislatures no member dared discuss the question. But in the new legislature private members, Conservatives, have not hesitated to speak out in condemnation of prohibition, one having declared his contempt for the law, saying if he wanted liquor he would get it and would "take it from a bootlegger if it was good stuff."

But the strongest evidence of the coming vote was the action of the present premier, G. H. Ferguson, during the recent session of the legislature. With his overwhelming majority he seems to have felt secure in asking anything, no matter how unreasonable. He could have kept his ante-election promise by simply taking a referendum on the O. T. A. Instead, he introduced and secured legislation enabling him to take a plebiscite if and whenever he felt there was a popular demand for it, and in addition secured a vote of the amount necessary to meet the cost of such an appeal. Not only was the premier given full authority and sufficient money to bring on a vote, but it is for him to say what form the questions on the ballot shall take. He may, if so disposed, confine himself to questions of which no prohibitionist could approve. It has now been decided that there is a popular demand for a plebiscite, and October 23 has been fixed for the vote. The form of questions to be asked has not yet, however, been arranged.

Ontario has had eight years of prohibition, but in all that time those who fought so hard for it have never felt secure. They see no reason for keeping the question open by the repeated taking of votes. The only way of meeting their great aim of permanent Dominion-wide prohibition, that will settle the question in Canada as effectually as the Eighteenth Amendment has disposed of it in the United States, is by federal legislation.

On the other hand the anti-prohibitionists have been waiting for such an opportunity as they expect Premier Ferguson will give them presently. Stocks in cellars are running low; some have been depleted and the owners, or many of them, dread being placed in a position of depending on illicit traffickers for their supply.

The Question in Other Provinces

THE O. T. A. is by no means a perfect measure and the antis have not neglected to stress its imperfections. They point to the ease with which a permit to buy may be obtained from a doctor, by which a quart of whisky is placed within reach; they tell of the "injustice" of a law under which a rich man need never be without a drink, while to a poorer man liquor is prohibited; they point to what they call the unfairness of a law under which a man found with a bottle of liquor in a place other than his home is fined two hundred dollars for first offense, while another who has poured the contents of a bottle down his throat and is picked up dead drunk escapes with a fine of ten dollars. All this and more do the antis speak of, not because they would have these faults remedied, but to condemn the law as a whole.

On the other hand, prohibitionists point to the wonderful social revolution that has been wrought since the coming of prohibition, the great improvement in industrial efficiency as testified to by large employers of labor, to happier homes, better clothed wives and children and the prospect, if prohibition is not interfered with, of boys and girls growing up without being exposed to the temptation that beset their fathers.

But Ontario is not the only Canadian province in which prohibition experiments have been made. Not long after the outbreak of war practically every one of the provinces was made dry by legislative enactment, the Yukon Territory being placed on the dry list by Order In Council. Quebec was the first to do away with the legislation which undoubtedly served a good purpose while war lasted, substituting therefor government liquor stores and sale of wine and beer in licensed houses, but not in bars, drinking rooms being considered an improvement on the old plan.

Drys Present United Front

THE Quebec Government boasts of a profit from the trade last year of four million dollars and prohibitionists declare that that is all that can be said in favor of the present law, adding that you must stretch the imagination to call it favorable. Next came British Columbia, where also prohibition gave place to government control, followed by Manitoba and Alberta, with changes of like nature. This leaves Ontario and the Maritime Provinces—New Brunswick, Nova Scotia and Prince Edward Island—still in the dry column, but in Saskatchewan the recent vote was overwhelmingly in favor of government liquor stores, while in the Maritimes it would seem that the people are satisfied to leave matters as they are.

The antis are heartened by the hope that the sympathy of the government is with them, by the evident revulsion of feeling in other provinces and by the belief that depletion of private stocks in cellars will add to their strength. Moreover, the opponents are supposed to have an abundance of funds with which to fight for the return of that which has been so greatly missed by them in recent years.

As for the prohibitionists, while they can see no reason for these frequent submissions of the question to the voters, they are prepared to present a united front whenever the vote comes and whatever the reading of the ballot papers. They feel their cause to be a righteous one and are filled with the hope that right will prevail. They gain confidence, too, by the recollection that every vote on the question in recent years, where party politics was not involved, as now, victory for prohibition has been overwhelming.

It may be stated as of some significance that no one is now to be found advocating the return of the open bar. The bar as it once was has gone for good; nobody wants it back. Eight years of prohibition has done that much good, if nothing more.

The James River—Where History Was Made

Scene of Pocahontas' Exploit and Cradle of America's Prosperity

By GEORGE H. DACY

NEAR the hill-bound heights of the tiny village of Hightown, Virginia, a cool spring gushes southward to feed Back Creek and join with Jackson River, Potts Creek, Cowpasture River and Bullpasture River to form the majestic James, a mighty stream which has helped to write American history.

Curving, twisting and meandering, the tortuous James flows 350 miles to the salt sea, divides the state of Virginia into almost equal parts and touches the soil of twenty-two different counties. Named after King James the First of England by Captains Christopher Newport and John Smith when they initially traveled its waters to Jamestown in 1607, the Virginia river has played an important part in the cradling and development of Uncle Sam's Republic. In early days, it was known commonly as "The King's River."

Today the James as a water boulevard winds its way through plantations and between many of the most famous mansions of America. For centuries the banks of the James have been centers of Old Dominion social life. From these plantations came the men who signed the Declaration of Independence and who fostered the Constitution of the United States. River packets, light freighters and excursion boats ply the James River. Annually the city fathers of Richmond petition Congress to straighten out the slants and crooks of the historical James and to deepen its channel so that the commerce of the seven seas may be brought by water to the very doors of Virginia's capital city. Potentially, Uncle Sam promises to heed these pleas to commercialize the inland waterway. Then the James River will write more new pages in America's history.

Shirley, built in 1642, is the oldest home on the James River. General Robert E. Lee's mother was born at Shirley. The estate is now one of the most productive in Virginia.

Jamestown Island on the north side of the James River about one hour's motor ride from its mouth is the site of the first permanent English settlement in America. For nine decades, Jamestown was the seat of government for the colony of Virginia. Then the colonial capital was removed to Williamsburg. The old ruins at Jamestown stood neglected for many years, mute testimonials of a vanished past. Latterly Virginia organizations and the Colonial Dames have restored the Old Tower and the Church. A statue of Pocahontas, the Algonquin princess, has been erected. The grounds have been beautified. Priceless relics have been unearthed from excavations amid the foundations of the historic buildings.

Nowhere on America's map is there a fount of history to equal the chronicles of Jamestown. There was held the first representative assembly of modern times; there took place the first jury trial in America; the first commercial tobacco was marketed there and the first marriage of English persons in the United States was celebrated. From Jamestown, the first turkeys and potatoes were exported to Europe. The first brick house in the New World was built at Jamestown as well as the initial ironworks in British America. The first written State Constitution was formulated there, while the city was also the birthplace of the "no taxation without representation" ideal.

The James River has been the scene of triumphs and tragedies. American liberty was cradled along its shores. Indian massacres, colonial famine and even acts of cannibalism have desecrated its course. A failure of the corn crop in 1609 reduced the ranks of the Jamestown pioneers from 500 to 60. Insatiable hunger and incomprehensible suffering forced the survivors to eat the bodies of their former associates. When finally succored, the few still alive determined to return to England, and but for the timely appearance of Lord Delaware with food and reinforcements Jamestown would have been abandoned. A dozen years later, following an Indian massacre of 400 white settlers, the colonists again considered returning to England. Thereafter, however, there occurred no more faltering.

The majestic James is rich, too, in Civil War experiences. More blood was shed along its banks in a few days during the efforts of General George McClellan to capture Richmond via the James entrance than resulted from the early centuries of struggle between the hostile redskins and Virginia's first white settlers. It is extremely unlikely that Richmond would have been rebuilt after its destruction by the Union army had it not been for the proximity of the James. The river waters that wash from Hightown to Hampton Roads have championed conquest, consoled defeat, erased errors, repaired the old and builded the new. They have carried away the debris of battle and have introduced the agencies of reconstruction.

The Algonquin Indians who peopled the James River country previous to the coming of the John Smith expedition used to call the upper James "Powhatan," while the lower part of the waterway was known as "Pasbaghe." Wahunsenacawh, seventy years old, husband of twelve wives and father of thirty-two children, was then king of the river and chief of the dominant tribe of red men. One of his daughters was the celebrated Pocahontas who saved the life of John Smith and, subsequently, married John Rolfe, an English colonist. Her real name was Matoaca (she who plays with something). Pocahontas was her nickname. It signified "little romp," "little wanton," or "little vixen." The hostility of Matoaca's father to the English was softened when his daughter married Rolfe. These nuptials established bonds of friendship between the white and red men.

A century previous to the Revolutionary War, Bacon's Rebellion was staged at Jamestown. The town was burned and when the ashes cooled, the ruined church tower was the only structure still standing. A score of years later, the remodeled state house was destroyed by fire. This led to the removal of the colonial government to Williamsburg where disease, mosquitoes and malaria were less malignant.

Strange to tell, in the years that followed Jamestown ceased even to be a village and became the property of a family named Travis. Notwithstanding, Jamestown retained its right to send one member to the House of Burgess for the next century. This was a political office of which members of the Travis family were always sure. A town which had ceased to exist thus gained political recognition for more than 100 years after its official demise. One of our national Senators, who recently visited Jamestown, when he was told this story immediately said, "I now understand why Jamestown Island is called 'Earth's only paradise.'"

Williamsburg, the seat of William and Mary College, although seven miles inland from the James River, has for centuries been intimately interwoven with the river's history. It is said of William and Mary College, established in 1693, and named after the English king and queen, that more illustrious men in proportion to the number educated there have gone out to make it and themselves famous than from any other educational institution in the country. George Washington was the first chancellor. Three Presidents of the United States—Thomas Jefferson, James Monroe and John Tyler—were educated at William and Mary. Chief Justice Marshall and Peyton Randolph, first president of the Continental Congress, were also alumni of the Virginia school situated near the James.

William and Mary was the first American college to institute the honor and elective systems. Its Phi Beta Kappa, an honorary scholarship society, was the first Greek-letter fraternity in the New World. The first college lectures in this country were delivered at William and Mary, a school which also boasts the pioneer departments of law, political economy, history and modern languages.

One of the curious rules at William and Mary was that no student should keep a race horse. Another regulation was that "drinking should be confined to that depictive of a prudent and industrious student." One old lady acted as stocking-mender for the entire college, being paid $60 a year for her services. She was obliged to provide her own "diet, lodging, fire and candles." The college remained in session during the Revolutionary War until the fighting became centralized in the James River peninsula. Then the college boys formed a company of volunteers and helped Washington defeat the British. Brafferton Hall, the initial Indian school of any consequence in the United States, was established at William and Mary College.

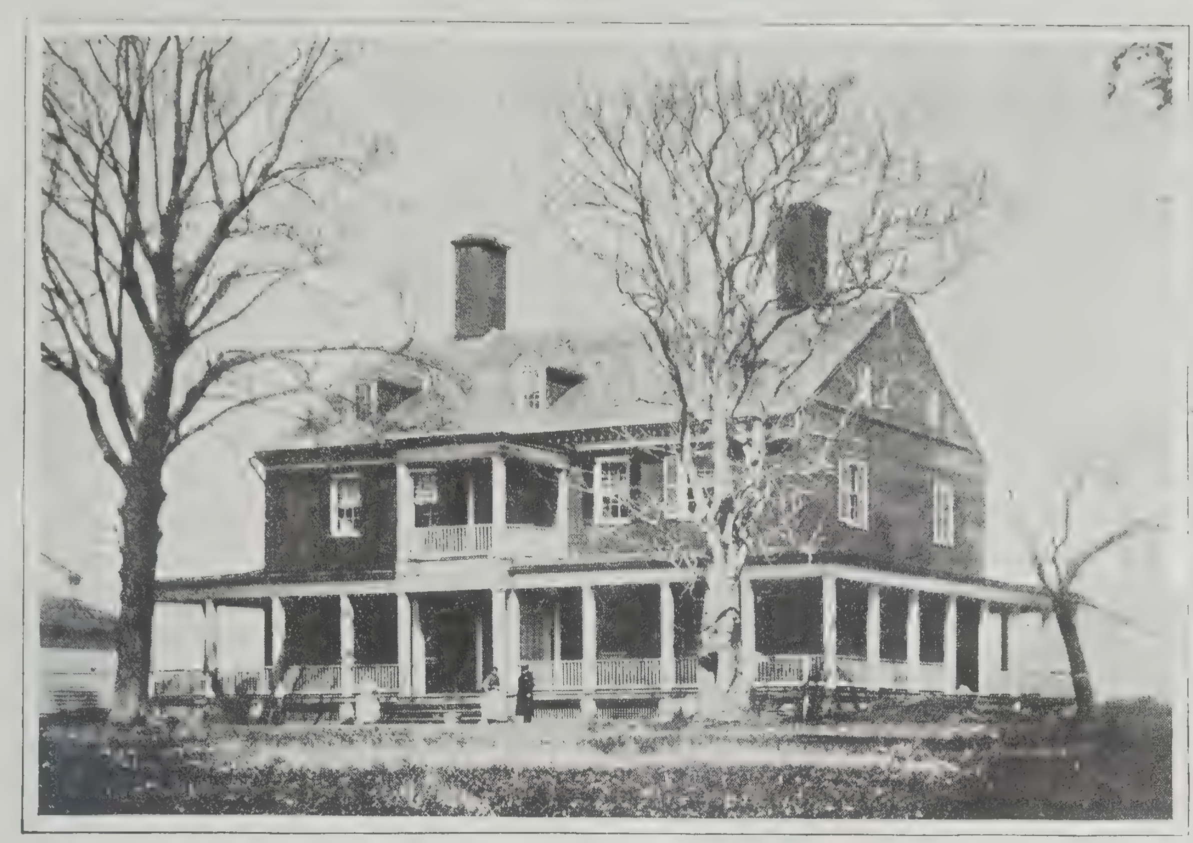
Westover, one of the most noted estates in Virginia and the South, fronts on the crooked pathway of the James. Rows of tulip poplars more than 160 years old underlaid by lawns as ancient adorn the homestead grounds. The mansion was built in 1730 by William Byrd, called popularly the "Black Swan of Virginia." Westover was a camping ground for Benedict Arnold and Lord Cornwallis during 1781, while McClellan's Union forces made headquarters there after the retreat from Richmond.

Berkeley, another famous plantation, adjoins Westover. The estate came into being in 1618 by special grant from the London Company. For five generations, Berkeley has been the home of the Harrison family in Virginia. It has been the birthplace of a governor of Virginia and a signer of the Declaration of Independence, a Revolutionary general and a President of the United States. Rumor has it that every President of the United States from Washington to Buchanan was at some time a guest at Berkeley. It was in this house that General William Henry Harrison prepared his inaugural address.

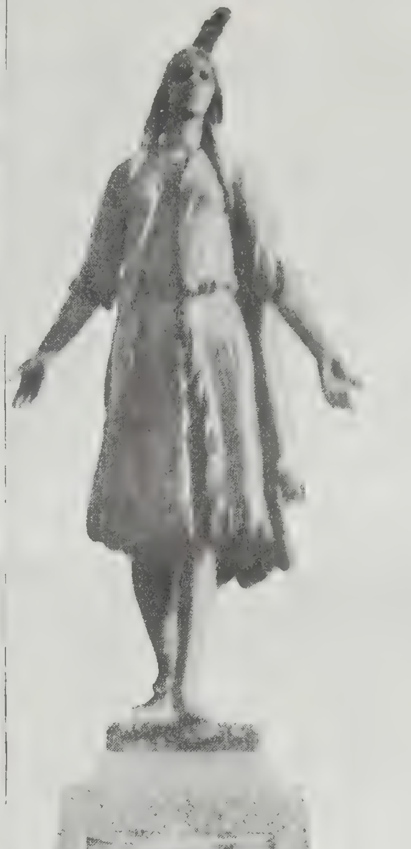
The family history of both Shirley and Lower Brandon, other impressive examples of colonial architecture that overlook the James, is illustrated by splendid collections of old mahogany, portraits, brasses and silver. Neither of these estates has ever been placed on the market. They have descended from generation to generation in the same families. Brandon plantation was initially granted to John Martin, a colleague of Captain John Smith. He sold the plantation in time and, thereafter, it passed through many hands, finally being purchased by a branch of the Harrison family. The finest old-fashioned garden in Virginia is now an outstanding feature of this remarkable mansion. Colonel Edward Hill, a leading man in the Virginia colony, was the original owner of Shirley, securing the grant early in the seventeenth century.

Malvern Hill, a neighboring estate to Shirley, takes its name from a village in England. This old plantation has been the camp grounds of four flags. Lafayette held forth there during the Revolution. It was the rendezvous of the Virginia militia during the War of 1812, while the forces of Generals Lee and McClellan waged a bloody conflict there during the Civil War. Varina, the home of John Rolfe and Pocahontas, now specializes in the production of pedigreed seed corn which

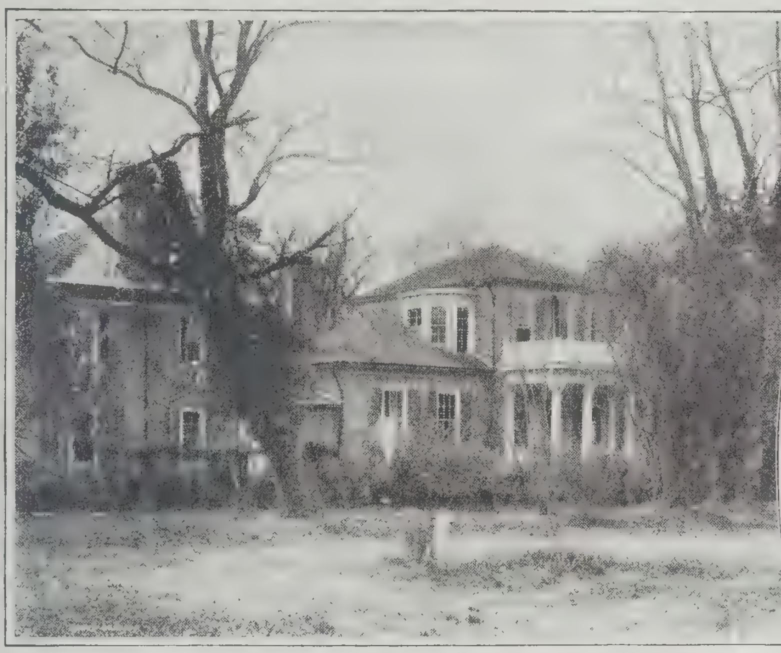
(Concluded on page 14)



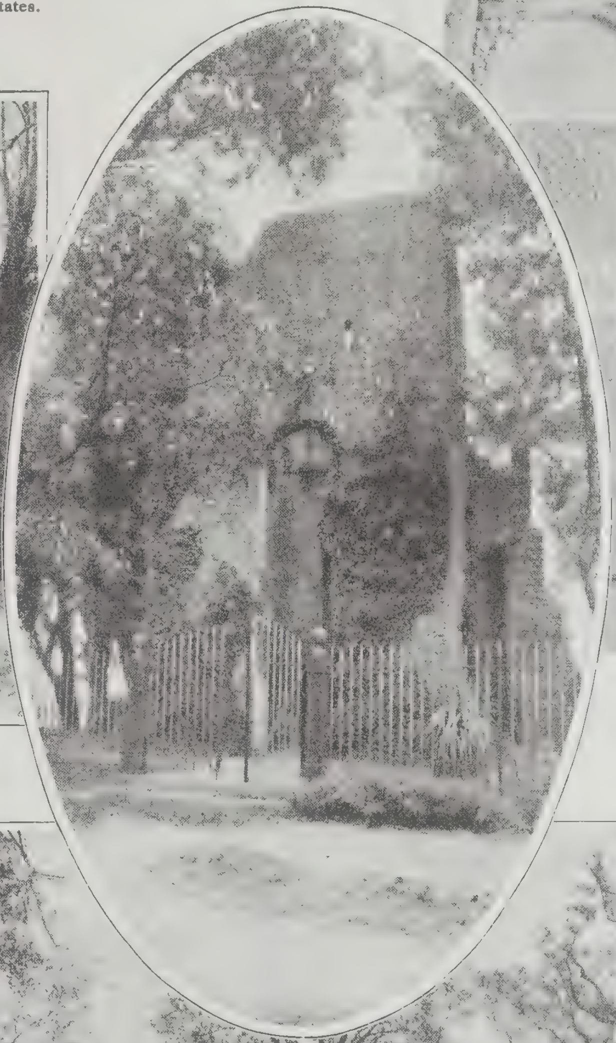
Berkeley, the James River, Virginia, estate of Benjamin Harrison, signer of the Declaration of Independence, and birthplace of William Henry Harrison, one of the Presidents of the United States.

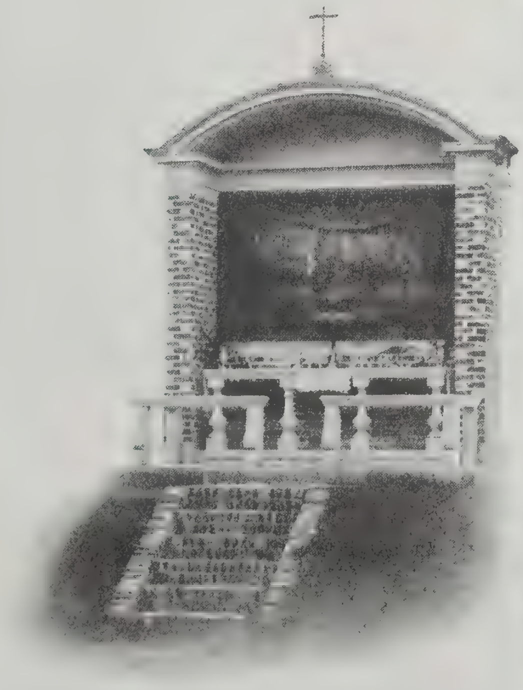


Above—This statue of Pocahontas is now one of the historical landmarks of Jamestown Island.

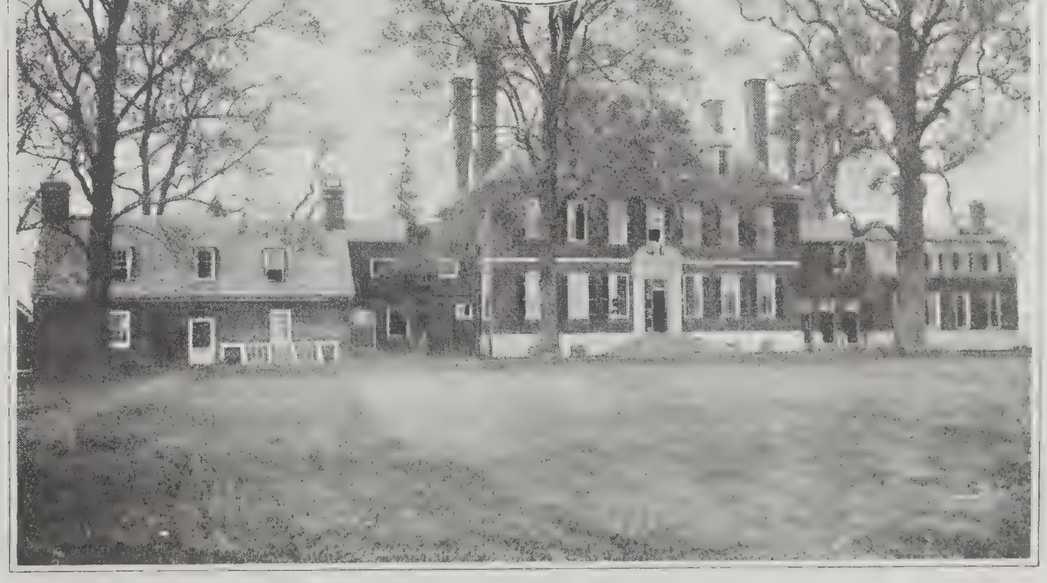


Lower Brandon, another Old Dominion estate whose patent papers were granted in 1635.





This shrine has been erected latterly at Jamestown Island to designate the spot where the Captain John Smith expedition held its first religious service.



Above in oval—The old ruins of the Jamestown Church have been restored and now are maintained by a Virginia society. Below—Westover, a famous James River estate, established in 1623. Brick used in house brought from England in 1737. Benedict Arnold landed at Westover in 1781 to march on Richmond.

Canalization as a Remedy for Dear Coal

Linking of Lakes to Ohio River May Revolutionize Transportation

By ROBERT EMERSON

THE great Northwest faces a crisis each winter over its coal supply. It has faced them for years and there is no reason to believe that it will not have a similar period of worry this year. Coal is high and complaint is continuous; and one of the greatest items in the price of coal is transportation—by rail.

A barge canal between the Ohio River and Lake Erie not only would lessen the likelihood of a coal famine in the Northwest and an "ore famine" for the industries of the Ohio Valley, but it would tend to cut the price of both and result in inestimable benefits for all concerned.

As long as the northwestern states must pay part-rail and part-water rates for the transportation of coal, they cannot secure fuel as cheaply as points on the Ohio, Mississippi and other navigable rivers which have the advantage of an all-water haul. At present there are many points having no waterway competition, but there are no points on lakes or rivers without rail competition.

Most of the coal for the Northwest comes from Eastern Kentucky and West Virginia and the railways make the same rate from those mines to the Great Lakes as from Ohio River points. In some instances where the railway has only one-fifth of the haul, it demands and gets four-fifths of the joint rate charged for a part-rail part-water haul.

The Dream of Business Men

THERE is at this present moment no way of getting from the Ohio or the Mississippi river to the Great Lakes except by rail. If the Great Lakes and navigable rivers were connected by a deep waterway, the all-water hauls on coal and ore would cause an industrial revolution.

That such a canal will be built some time under the supervision of the Federal Government is more than a possibility; it is a probability, and when it is completed there will be a new era of business in which many states and many cities will benefit.

This waterway has been the dream for years of business and civic leaders in Cincinnati, Pittsburgh, Columbus, Toledo and other great industrial centers. Detroit has shown little interest in the project, but Detroit would be one of the chief beneficiaries; so would Chicago and Cleveland, and here is the reason:

It is the history of transportation, according to Samuel J. Flickinger, secretary of the Central Inland Waterways Association of Cincinnati, that the railroads seek to meet water rates, and water rates now are about one-sixth rail rates. It was true when the Panama Canal was built and the great transcontinental railroads reduced their charges to "meet competition."

The result has been, according to Mr. Flickinger, that it is cheaper to ship from New York to San Francisco by water than from New York to Denver and to points even farther east than Kansas City by rail.

Detroit, Toledo and Cleveland have become great cities largely because they have been able to get, and of course still do get, ore at water rates. Pittsburgh has become great because it is contiguous to the coal fields and gets coal at water rates.

Imagine the possible, nay, probable growth of these cities, and their rapid industrial development, were they able to get both coal and ore at water rates!

Many of the great coal mines are located along navigable streams, notably those along the Big Sandy and the Great Kanawha. Some operators own their own railroads from the mines to the Ohio or other rivers and fuel is dumped directly into the barges.

Boats, towing from four to ten barges filled with coal, constantly ply the Ohio from the mining districts to Cincinnati, Louisville, Evansville, and other cities along the Ohio and the Mississippi rivers, where the coal is transferred to cars and shipped to inland points by rail.

Story of the Canals

ONE mine owner recently declared that a barge canal to the lakes would be able to handle most of the shipments of coal to the Northwest, which requires many millions of tons every year.

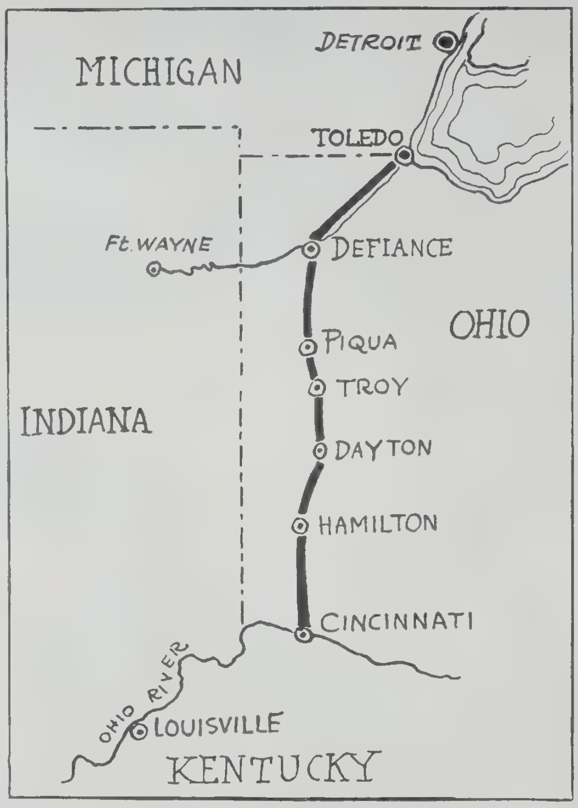
Advocates of the waterway believe that Government engineers, after a careful survey, will recommend that a barge canal be dug, and they visualize great fleets of barges carrying freight to and from the Lake States, the Ohio Valley and the South.

The value of water transportation is becoming more and more apparent to business men, especially the very large shippers. How many, though, are aware that perhaps within a year it will be really possible to ship from New York via the Great Lakes to St. Louis and New Orleans by water? Very few, for little public attention has been directed to the mammoth project of canalizing the Illinois River from the present Chicago drainage canal to the Mississippi. The work which has been going on for several years, Mr. Flickinger asserts, will cost when completed more than $20,000,000 and be the final connecting link in a chain beginning at New York, following the Hudson, the New York barge canal, the lakes and straits to Chicago and thence through the drainage canal and improved Illinois River to the Mississippi.

It is the hope of the proponents of the Ohio-Erie route to have a canal sufficiently large for barges with a capacity of 3,000 tons. When one figures that the average carrying capacity of the coal car is less than fifty tons, some idea of the magnitude of the size of the barge may be obtained. The canal would be at least twelve feet deep, and have a width of seventy-five feet at the bottom and 110 feet at the top. The banks would be of concrete to prevent erosion and the barges would be motor-propelled.

The government policy today, and it has been so for many years, is against the construction of canals that do not connect navigable lakes or streams.

In the early days of Ohio there were four canals leading from Erie to the river and many branches or laterals to the cities and villages off the main route. The larger cities had their basins or small lakes where the boats were loaded and unloaded, and the total tonnage which they carried was surprisingly large.



Boats for nearly a century were drawn by relays of horses and mules and progress was necessarily slow. Later the "electric mule" came into being, tracks being laid on the old driveway on the banks. There was the overhead trolley, of course, and the work car. This method proved expensive and was a failure. Still later the motor-driven boat was attempted, but this barely got out of the experimental stages.

The decline of the shallow canal began with the coming of the railroad and the demand for greater speed. Today the demand is for more canals because of excessive rates and congestion of railroads.

The old canals for the most part were built by the state and Federal governments, the state now controlling them, or, to be exact, what is left of them: for the property, worth untold millions, is lying useless and the banks are strewn with wrecks of boats that served the shipping needs of great populations a quarter of a century and more ago.

The property, too, is not quite useless in a few short stretches. Cities along the routes have converted the banks into beauty spots and at every session of the state legislature there is an attempt made to obtain leases so that the unsightly waterways may be converted into boulevards or parks; there has even been the suggestion that the entire Miami and Erie, running from Toledo to Cincinnati, be abandoned and converted into an automobile driveway; which is one of the pleasures to contemplate and anticipate, if the property ever is abandoned.

Surveying the Field

AGITATION for the deeper canal has been going on for several years, but it was not until five years ago that organizations began to be effected to promote the idea.

Four possible routes have been suggested:

Route No. 1—From Pittsburgh through Youngstown to Ashtabula.

Route No. 2—From Marietta through Zanesville to Cleveland.

Route No. 3—From Portsmouth through Columbus to Sandusky.

Route No. 4—From Cincinnati through Hamilton and Dayton to Toledo with a branch from Defiance to Lake Michigan and the Northwest.

In the preliminary investigations of army engineers, Route No. 2 was eliminated because it was found that sufficient water could not be obtained, since the rubber factories at Akron had appropriated the supply from the watershed.

Major General Lansing H. Beach, chief of the United States Engineers at Washington, assigned the field survey work to Colonel Charles W. Kutz in charge of the division, with headquarters at Cincinnati, and he in turn appointed C. I. Grim to be in charge of the field forces.

These forces are tabulating and making estimates from their field notes. The field work on Route No. 4 from Cincinnati to Toledo was completed in May of this year and field work on other routes will soon be done so that Colonel Kutz and Mr. Grim now expect to have the report of the survey of all the proposed routes ready to submit to the Board of United States Engineers at Washington, of which General Harry Taylor is chairman, by next October. Field work was not interrupted by the weather of last winter so that the engineers now expect to have this report ready for incorporation in the annual report of the Secretary of War to be submitted to Congress when it convenes in December.

Whatever may be the recommendations of Colonel Kutz, Mr. Grim and their assistants, the report must be concurred in by the board, of which General Taylor is the head, and then the chief of engineers and the Secretary of War with the final referendum up to Congress.

In event of the selection of a route next winter and the necessary appropriation, there are those who predict that construction may begin next spring and be completed within five years. More progress has been made in the last twelve months than in all the previous years.

Backing the Rival Routes

PITTSBURGH interests made a survey of several routes to Lake Erie on their own account and at their own expense and Professor C. E. Sherman with the engineering department of Ohio State University at Columbus, Ohio, made one of Route No. 3. No survey of Route No. 4 had been made since that of General Chittenden of all canals in the state in 1894 until the one that is now practically completed.

The Columbus and Pittsburgh surveys by private interests are not considered official.

Each of the organizations listed, of course, maintains that the route it is backing is the best, but a canal over any of them would be acceptable to all who are interested in obtaining all-water-haul rates.

Friends of waterway transportation point out that a canal from the Ohio River to Lake Erie will make it possible to ship throughout the year with the single exception of a short period in some winters when the canal or river would be frozen. Canalization of the Ohio from Pittsburgh to below Cincinnati already has been completed at a cost of about $70,000,000. Some work already has been done far below Cincinnati, but there is considerable yet to do in the matter of building locks and dams. Until the river had been canalized there were many weeks during the summer when the water was too low for navigation; since the canalization traffic has increased tremendously.

Many of the packets are from Pittsburgh to Cairo but a majority of them are for shorter distances. Towboats, however, now run from Pittsburgh to New Orleans.

Whether any of the old ditches would be used in the construction of a new canal is doubtful. Many of them run through invaluable city property and this is a hindrance, so that it is considered more than likely that canalization of streams not now navigable will be suggested wherever possible.

A board of engineers at first reported adversely on the whole project but only after a not too exhaustive investigation. With the report the canal advocates became more active, so that the field survey was ordered. It is believed this report will show that a canal would be a profitable and a proper undertaking for the government.. The first report, by the way, favored the Pittsburgh route as the shortest and cheapest and estimated that a total tonnage of 20,000,000 a year would have to be carried to justify the work.

Any Route Will Do

AN argument advanced at that time was regarding the cost which the engineers reported as prohibitive but the estimates were made when prices were highest right after the war and were conceded not to be correct, or to fit in normal conditions. The recommendation carried a suggestion that state and local governments be required to pay seventy per cent of the original cost, the Federal Government to pay thirty per cent and to assume the maintenance and operating costs.

The estimated cost of the Pittsburgh route at that time was $120,000,000 and the investigators advanced the argument of obstructive bridges against its selection.

The Cincinnati-Toledo route was estimated to cost $195,000,000. With the branch from Defiance to Lake Michigan, the cost would run close to $400,000,000. The Portsmouth-Sandusky route was estimated at $175,000,000.

These figures are of course excessive and they do not frighten those who are advocating a canal. They have the confidence that tells them that a waterway such as they desire would be more than a local improvement; it would be an asset to the nation and result in greater prosperity and more rapid growth and cheaper fuel and cheaper ore for millions.

Then, too, they are confident that the new estimates will be much lower.

Here are the officers of the associations backing the canal:

W. H. Stephenson, president, and Burd S. Patterson, secretary, Pittsburgh, for the Pittsburgh-Ashtabula route; Henry Williams, president, and J. T. Daniels, secretary, Columbus, Ohio, for the Portsmouth-Sandusky route; Albert Krell, Cincinnati, and S. J. Flickinger, Hamilton, the Cincinnati-Toledo route.

But any route will do.

Consumer Is Industry's Dominating Factor

Further Analysis of the Douglas Idea for Maintaining Social Credit

By WILLIAM WILSON

The following is Mr. Wilson's second article on the Douglas idea, in which he arrives at further conclusions based on the writings of Major C. H. Douglas, and discusses remedies for the social and economic problems, particularly unemployment and industrial dislocation.

WE WILL first of all repeat the conclusions arrived at in our first article of this series:

1. The reason that the peoples of the world are suffering from poverty and unrest in ever-increasing numbers is *not* that nations are poor—nor that populations are too large.
2. The growing distress and unrest is *not* being caused by any moral failings in the people.
3. Neither any fault in production, nor in producers (masters or men), is responsible.
4. The real root of the problem rests in the plain fact that, although we can easily make all the goods we need, we are unable to distribute them effectively.
5. The machinery of distribution is money. It is money that is not fulfilling its proper function.
6. The control of the issue of money is in the hands of a very small minority who are, consciously or unconsciously, enslaving whole communities to a system that can only remain active so long as poverty, waste, work, *and war* exist.
7. By the automatic—and quite unchallenged—process by which all industrial costs are included in the prices of goods to consumers, we have the absurd result that no nation, taken as a whole, can purchase the goods it makes. The consequence is a growing struggle for export markets. This struggle leads to periodic wars—whether sentimentalists denounce them or not.
8. The solution of the problem can only be effected by some arrangement whereby consumption can proceed as quickly as does production. And this can only be brought about by the issue of money, or its equivalent, for *consumption as consumption*—money that will not be added to selling-price, and the sole function of which will be the delivery of goods and services to individuals. . . .

A Rigid Financial Machine

"IN CONSIDERING the design, either of a mechanism or of an undertaking, it is first of all necessary to have a specific and well-designed objective, and after that, a knowledge not only of the methods by which that objective can be obtained, but also of the nature and treatment of forces which will be involved, the materials available, and their reaction to those forces."

The objective—the "why"—of a certain mechanism or undertaking is the domain of policy. The carrying out of this policy—the "how"—is the domain of administration.

In this division between the why and the how of industry rests a vital fact; while society is falling into chaos fighting over the how, the why goes almost entirely unchallenged. Socialists, conservatives, masters, men, priests, revolutionaries, are all wrangling over the control of administration in its various departments—but they are all in perfect agreement on the policy that underlies the structure of society. They will all bring forward pet schemes to cure unemployment, or to balance budgets; but none of them pauses to question why every man *should* be employed, or why budgets *need* balance.

The reason behind this condition of affairs does not rest in any fault in the individuals comprising society. We all learn by looking around us, and what we don't see we don't suspect. It is one of the most vital characteristics of the orthodox system that what "pays" must be boosted—and what doesn't "pay" must be left severely alone. Since it doesn't pay the invisible government to allow questions of policy to be raised, questions of policy are *not* raised. The finance-controlled press keeps as silent as an oyster, and consequently John Smith goes about his work happily ignorant of the forces controlling his labors—his consumption-rate—and very often even the number of children he may have.

Anyone who replies, "the world *is* tolerating the financial system," has only to look around to see that it *isn't*. Britain today is seething with unrest. Labor disputes come, one after another, and the issue of each is more vague than that of the one before. Communist orators can be found in dozens about London—in public squares, in parks, at street corners. Instability can be seen everywhere—if one cares to observe. And, considering Britain is looked upon as the stable nation of Europe, the kind of "toleration" the industrial system is receiving in other European countries may be imagined.

In this world of ours, it is action that counts. Might always get the best of an argument, whether it be right or not. The only way in which right can be installed as a working policy is by making right mighty—and this means the acquiescence of the majority to a right objective. Is it possible to bring about this happy condition to settle our industrial problems? Let us consider a few of the points involved.

Altruistic Ideals

ALTRUISTIC action may be dispensed with at once. Altruism is a characteristic of an occasional individual, but it is never to be found in crowd-psychology. Ideals—like those the well-meaning Socialists or Communists foster—are pure fantasies, simply because they are based on mass-altruism, a human quality that doesn't exist.

Is it possible to get a parliamentary majority working along the right lines? Theoretically, it seems possible, but actually any hope in this direction is too distant to be practical. It is perfectly sound to infer that a majority, fully informed, might work political miracles. But, seeing that the only way of disbursing information is through the press, and that the press is almost completely controlled from high financial sources, we are drawn to the conclusion that the permission of finance must be obtained before finance can be attacked—which is absurd.

It needs no great penetration to see that, by bribes in various disguises, money power can raise parties to eminence, or send them to political perdition; or, what is worse, finance can keep two parties so nearly balanced that each defeats the purpose of the other, causing contempt and ridicule. This is the condition the British Parliament is in today.

We must conclude, then, that neither altruistic ideals, nor parliamentary action can be looked to for the wedding of right with might.

The Unemployment Problem

"LET us, therefore, return to the springs of action in individuals. There is doubtless a certain small number of individuals whose interests are indissolubly wedded to the present economic and social system. The essence of this attachment to it is the fact that it places them in positions of enormous, if frequently hidden, power, and this power, far more than any material reward, is the object of their concern. These individuals are not amenable to any argument other than *force majeure*."

Accordingly, it seems that nothing can be done to get mass action toward the right objective until after the strongholds of finance have been attacked, which brings our line of reasoning round in a "vicious circle"—"We can only defeat money power with money power."

As we find ourselves at the point from which we started, it is clear we must take our line of reasoning at a different angle.

Now, what force has the financial system used, up to now, to insure the co-operation of the units of society? What is the policy that can be depended on to get everyone working together toward a desired end?

A few seconds of thought will give the answer to this question. The one inducement that never fails is "a living." The system that makes provision for all will get the support of all.

Up to fairly recent times the Financial System had the confidence of the masses because it made a livelihood possible—though only *just* possible—for everybody who would "work." Now, however, a growing number of persons are finding that there isn't enough work to go round, *however* willing individuals may be, and, worse, that "work" doesn't necessarily mean an adequate livelihood.

Everybody knows that England has at present a million and a quarter unemployed, but few statisticians would like to count the millions who *are* employed, and yet are living at a semi-starvation level. And it is a fact which we must face sooner or later, that there is no way to make this situation any better if we are to keep within the rules of the orthodox system.

"Not only is it indisputable that the industrial system does not do this (provide adequate livings for all) at the present time, but it is not even publicly contended that this is its object. As a system, it is only considered to be open to criticism when it fails to find employment for everyone.

"So far as the generally accepted methods of democracy are adaptable to the situation, there is no shadow of doubt that the first and most important task for the majority is to vote on this single issue. And the first task for any executive, genuinely empowered by the majority to serve its best interests, is to devise means by which the desires of the majority can be given effective embodiment."

A Mistaken Theory

IT IS vital to recognize the importance of consumption in the industrial process. If it were not for consumption, it is obvious industry would have no meaning whatever. Yet, think of the mountains of paper and the seas of ink that are used yearly in discussing manufacture—its successes, its control, its efficiency, its salesmanship, its advertising—without so much as a passing word on consumption, *its* success or failure, *its* control, its insufficiency, its *lack of any means to advertise.*

The vast majority of persons have been schooled to believe that the act of consumption, past a point that is but a particle in excess of subsistence, is practically sinful. If you put the proposition to the average man, "Picture a community consuming goods—necessities *and luxuries*—as fast as modern machinery, working at full capacity, could produce them."

Notice his reaction—trepidation! Ah, the demoralization it would cause! The press-created psychology of almost every ordinary individual sees a poor man made comfortable inevitably turn into a bad man. Yet the idea is sheer nonsense to all who care to look about them and think it out.

"It is possible to remove every factor from the industrial system, except effective demand, and some sort of industrial system, however primitive in kind (to the extent of digging for roots and climbing for fruit), will remain; but take away the desire, the need, or the belief in the ability to consume, and not a seed will be planted, nor a tool employed.

"It is not for lack of technical ability, but for lack of effective demand, that civilization today stands on the brink of irremediable catastrophe." In short, at present the forces of human nature are being kept subservient to a rigid financial machine, whereas the only just way—the only practical way—is to make that machine flexible to human nature.

"We are in the position of a would-be engineer who refuses to accept the principles of thermodynamics, and, instead of endeavoring to improve his steam engine, tries to alter the properties of steam."

Money, to be effective, must be a true reflection of the real wealth of the community—it must reflect the actual ability of the people as a whole to make and deliver goods to individuals as they want them.

Production can be carried on only by means of this credit inherent in the community.

Therefore, the product rightly belongs neither to the master-producer nor to the laborer, his partner; it belongs to the community from which production has derived its financial energy. The only claim that master or man should have over the goods produced should be on the score of their being consumers.

"It is the business of the scientist, the designer, and the inventor, to place before the individuals who compose the public the achievements which are considered possible. It is the business of the public to say in what quantity and in what priority, it considers these achievements desirable. . . . That is practically what happens at present, with the vital exception that the order system which connects the individual with the producer does not function; whether by accident or design is largely immaterial."

Let us now consider this order system that is not functioning. At present a certain quantity of goods is produced over a certain period of time, and this production sets sums of new credit in motion. Some of the goods are for consumption; but the majority, these days, are sure to be capital goods, goods that are only a link in a new productive process.

Distribution of Credit

SUPPOSE that consumable goods represent one-quarter, and capital goods three-quarters of the total produced in the period under consideration (this is by no means an exaggerated ratio). At the end of the time the consuming public will have received one-quarter of the national production, although by the "law" (blessed word) of supply and demand, it will have paid *the whole of the issue of money* in prices for that quarter share. The pricing system, as it exists, makes this process automatic and, for that reason, it is the pricing system that must be criticized and attacked if there is to be any kind of democratic control of policy.

Before communal control can be hoped for, individuals must have control over a large bulk of spending power, which at present merely flows back to its financial source—the banks.

In the above instance the community needs to possess four times the spending power it actually receives and three-quarters of this must come not through wages (or it will only level up prices), but from that fund of real wealth which has been produced in the interval. It must, in short, come from the source that at present allows banks to lend more than they receive.

Exactly how this distribution of credit through prices could be made is a question for trained accountants. There can be little doubt that, were they set to the problem, *and paid for the labor*, the men clever enough to prepare balance sheets for banks and insurance companies could devise an adequate bookkeeping scheme for social distribution of credit.

It might be done by the issue of discount vouchers against all goods sold for actual consumption. At the supposed ratio of three-quarters the buyer of a pair of shoes at eight dollars would receive from the retailer a voucher for six dollars. That voucher would represent the consumer's share inherent in the manufacture of that particular pair of shoes, and would carry with it all the privileges that a check receives today.

Bearing in mind that everybody consumes, this system would satisfy everybody. Not a single individual would be worse off; there would be no need for confiscation, nationalization, or any other of the "ations" that spell death to enterprise. The only forfeiture that would be necessary would be that of *power* by a mere handful of financiers.

It Is Action That Counts

IN CONSIDERING how a change so far-reaching could be made, let us first emphasize one point: This is *not* a question of ideals, it is a question of real forces with which we of this generation have to contend.

"The break-up of the present financial and social system is certain. Nothing will stop it. 'Back to 1914' is sheer dreaming. . . . The only point at issue is the length of time which the break-up will take. . . . There will probably come, well within the lives of the present generation, a period at which the blind forces of destruction will appear to be in the ascendant. . . . There is, at the moment, no party, group, nor individual possessing at once the power, the knowledge, and the will which would transmute the growing social unrest and resentment into a constructive effort for the regeneration of society. . . . but it is difficult to believe that the whole world is so bereft of sanity that a pause for reflection is too much to hope for, pending a final resignation to utter catastrophe. . . . During that period a small impetus from a body of men who know what to do, and how to do it, may make the difference between yet one more retreat into the Dark Ages, or the emergence into the full light of a day of such splendor as we can at present only envisage dimly."

Sapiro Invades the Tobacco Field

Concluded from page 5

one can hire a man familiar with the line at this salary. Mr. Rogers was—and is, for his business has not been interfered with—a wholesale groceryman, and probably, for this reason, was believed to know all about tobacco, with which he had never had any connection, and with warehousing and warehouses, which he knew only from the outside.

However, in the Sapiro organization, the less a man knows about the work he is supposed to be employed to do, and the more he knows about Mr. Sapiro, the better qualified he is to exploit the American farmer. After all, there may be something to the now old song about the man who affirmed that he had no bananas.

Some Prices for Warehouses

AND, while we are discussing warehouses, let us not forget that the subsidiary corporation to operate warehouses is the first step taken by Mr. Sapiro after he has formed a co-operative marketing association in any branch of the industry. There seems to be a sort of financial attraction about the co-operative operation of warehouses which appeals to Mr. Sapiro. Following this plan, the Burley Tobacco Growers' Co-operative Association, also organized and controlled by Mr. Sapiro, has 119 warehouses. At the first meeting of this association, whose salary list for executives is comparable in top-heaviness with that of the dark tobacco group, Sapiro prepared the minutes in advance of the meeting. These minutes contained a resolution that James C. Stone be made general manager at $20,000 a year, and that R. M. Barker be made director of warehouses at $18,000 a year. Mr. Barker was given absolute authority to buy all the warehouse property he might deem necessary to the conduct of the association's business. In addition to this purchase and control of warehouses, Mr. Barker was given authority to make contracts with the dryers to re-dry the association's tobacco.

Now, several of the directors, as well as Mr. Stone, the general manager, and Mr. Barker, had warehouses which they wished to sell, and did sell, to the association.

In addition to this, Mr. Barker owned, and still owns, a re-drying plant.

Approximately $6,000,000 was expended by this Burley association in the purchase of warehouses, which should have cost rather less than $4,500,000. The writer has been unable to get the figures on all these warehouses; it is current belief in Kentucky and some of the other states that the records of these transactions have been "lost." But some such records remain, notably one which shows that Mr. Stone, general manager, sold for $250,000 to the association in 1921, two warehouses which he had purchased during the war, at the record high level of prices, for $165,000. Mr. Barker also sold his own warehouse to the association, but the record of this is among the missing.

Here is a table, necessarily brief, showing the profits taken from the farmers in the Burley tobacco association, by ten owners of warehouses who sold their plants, through Mr. Barker, to the association.

Name of Warehouse	Price paid in 1917-18.	Paid by association 1920-21.	Profit from farmers.
Independent	$ 80,000	$ 130,000	$ 50,000
Central & Planters	165 000	250 000	85,000
Headley	110,000	175,000	65;000
Growers Co.	70,000	118 000	48 000
Burley	225,000	295,000	70 000
Tattersalls'	200 000	260,000	60,000
Shelburne	70,000	140,000	70,000
Maxwell's	60,000	72 000	12 000
People's	25,000	45 000	20,000
Geary & Buckley	80,000	125,000	45,000
Totals	$1,085,000	$1,610,000	$ 525,000

These warehouses were sold by the Louisville Warehouse Company in 1917 and 1918 during a period of extremely high prices to the private owners named. These owners, in 1920 and 1921, during one of the worst economic slumps Kentucky ever experienced, sold them to the Sapiro-created, and Sapiro-directed Burley Tobacco Growers' Co-operative Association, through a director of warehouses who was Sapiro's appointee, for an average of approximately fifty per cent more than they paid for them. The entire ten are in Lexington, Kentucky.

There is no evidence at present to show that Mr. Sapiro received any "commissions" on the sales of these warehouses, any more than there is to indicate the amount of commission he has received from Weyl & Zuckerman, if any, for the sale of vegetable, fruit and other products of western members of the Sapiro Plan co-operatives. But it has been reported, and never denied by Mr. Sapiro, that he did get $16,000 as "supervising legal counsellor" for the warehouse corporation which he formed subsidiary to the Burley Tobacco Growers' Co-operative Association. Just how this was put over at a meeting of the directors of the subsidiary is a story now familiar throughout Kentucky.

According to the Lexington *Herald*, a newspaper which has been doing all that lies within its power to save the tobacco industry from the Jewish grip, the Burley Tobacco Growers' Co-operative Association, organized and directed by Sapiro, paid to that altruistic gentleman "between $45,000 and $50,000." Mr. Joseph Passonneau, now state director of markets in Colorado, but formerly organizing director for Sapiro in the tobacco fields of the five states mentioned, declares that Sapiro received $36,000 in fees from the Burley growers, and $16,000 more from the subsidiary warehouse corporation—a total of $52,000.

From the Dark Tobacco Growers' Association, Sapiro is reported to have received—and has never denied the report—$30,000 in the method described earlier in this article, and $22,845 for "legal services," apparently in addition to his regular fee as "supervising legal counsellor." More than this, the able Aaron not long ago presented an additional bill for $2,500, which at this writing had not been paid.

Co-operative farm marketing, as practiced under the Sapiro Plan, whether it be in the prune orchards of California, the wheat fields of the Northwest, or the tobacco plantations of the Southeast, merely means providing payment for a lot of swivel-chair sales experts, managers, directors and other executives; the opening of opportunity for sale to the associations of whatever equipment certain favored executives and directors may have, and, ultimately, the support by these overpaid Gentile officials of the associations of the Jewish ring which is seeking to exploit the American agriculturist. The farmer and his welfare are the last factors considered by any of these promoters in organizing, controlling and directing the Sapiro Plan co-operative marketing associations.

In the tobacco regions, as in other agricultural districts invaded by the Sapiro Plan, there are established under the general associations numbers of local associations or branches, each of which provides a number of executive positions at high salaries for the lieutenants of Sapiro and for their friends. One of these locals in Kentucky—the Christian County Local—at the request of its members, attempted to make an investigation of, and a report on, the condition of the Dark Tobacco Growers' Co-operative Association. Though met with opposition, "office politics" and deception on every hand in the offices of the association, nevertheless this committee, headed by M. J. Boyd, persevered, and finally rendered a report which is one of the most interesting documents yet written in this effort to break the grip of organized Jewry on the American farmer. It cannot be reproduced in full here, but the report shows that the association produced for the 1922 crop approximately 175,000,000 pounds of dark tobacco, of which "all but about 30,000,000 pounds" had been marketed on May 5, 1924. That is to say, two years had been required to market 145,000,000 pounds of tobacco, whereas, prior to the organization of this association by Aaron Sapiro, the entire crop had been marketed within three or four months after it was ready for sale.

Who Owns the Association?

BUT the report also shows that to market this 145,000,000 pounds of tobacco, the costs to the association totaled $5,495,410. Now this dark tobacco brought a top average of thirteen cents a pound, or $18,850,000 for that part of the crop marketed. That is to say, the cost of marketing this tobacco through the Sapiro-directed association was almost one-third of the sale-price of the tobacco. For every thirteen cents the Kentucky tobacco-grower received for his crop, he paid out approximately four cents for the cost of marketing. Incidentally, this report figures that Mr. A. Sapiro, of San Francisco, received $58,068.90 in fees *for the year 1923 alone.* This is more than other investigators have given as Mr. Sapiro's fee, but the writer believes it is more nearly correct than any. How long could any private enterprise hope to survive if it spent one-third of the price of its product to sell that product? Not one-third of the cost-price, bear in mind, but one-third of the selling price.

In concluding its report this committee very naïvely says:

"The members of this committee have been under the impression that the association belongs to the farmers who are feeding it with their tobacco, raised on their lands by the sweat of their faces. Perhaps we are in error. It may be that the association is owned by the men who are drawing large salaries and being paid fat fees; that the farmer's only duty is to grow and deliver the tobacco; his only right to receive what is paid to him from time to time, with the positive understanding that if he should so far forget himself as to open his mouth, he will be spanked and put to bed.

The Summing-Up

"SURELY, surely, however, this cannot be true. Yet, when we come to think about it, we were in and out of the association headquarters for several weeks, and we did not see any farmers holding office in or drawing large salaries from the association, or in any other way showing ownership therein.

"The affairs of this association (The Sapiro Plan Dark Tobacco Growers' Association) have not been properly managed. The expense account shows gross and reckless waste and extravagance. Outrageous prices have been paid for warehouses; new warehouses are being erected at points over the district. The members are carrying the surplus tobacco, to the profit of the non-member. Politics play an important part in the policies of the association.

"Salaries paid by the association are far greater than salaries paid for similar services in other lines of business. The expenses of the association run into figûres so large as to stagger the imagination. As one official of the association said:

"'More money was spent last year than I thought was in all the world.'"

In spite of all this, in spite of the flamboyant promises made to the tobacco-growers of five states by Aaron Sapiro when he carried his disastrous plan of co-operative marketing to them three years ago, one-sixth of the 1922 dark tobacco crop is unsold at this writing; less than half of the 1923 tobacco crop has been disposed of, and, in the language of one of the largest co-operative growers in Kentucky, "the God of Isaac and of Jacob—and of Aaron—alone knows what we'll do with the 1924 crop." Possibly Aaron of San Francisco knows, but he is now flitting about in Europe, and has as yet given nothing by way of solution to the men who paid him more than one hundred thousand dollars to be their "supervising legal counsellor."

A Psalter Now Worth $75,000

Concluded from page 3

London in 1599; this is the only known copy of this edition of the "Venus and Adonis."

The two American libraries which contain the finest collections of early English printed works are the Henry E. Huntington Library, at San Gabriel, California, and the J. P. Morgan Library, recently presented to the City of New York. Only the most unusual circumstances have made possible these libraries which harbor treasures equal to any in the world. As far as early printing is concerned, Harvard College Library with its Widener Collection, the New York Public Library, the Newberry Library in Chicago, and the Ann Mary Brown Library in Providence, Rhode Island, enjoy wonderful collections. English writers have achieved a real "place in the sun" of the book market. In general the authors popular with the ordinary reader are the ones whose works have achieved the further fame of high prices. Burns and Byron and Shelley among the poets, with Dickens and Stevenson and Joseph Conrad among writers, are considered by the collector as assured of undying fame. In general the judgments of the auction block—for books are sold in this way—have been sound.

Shelley's "Queen Mab" with his own autograph corrections, published as late as 1813, brought $6,000. At a sale in New York of the manuscripts of the works of Joseph Conrad a grand total of more than $110,000 was reached. This distinguished author is one of the elect few to live to enjoy some direct participation in the extraordinary prices of his manuscripts and first editions of his works.

Dickens' works were largely published in a form something like dime novels or penny dreadfuls, issued in parts with yellow or blue covers and advertisements. The true Dickens' enthusiast must have all the blue covers and the "ads" and he is willing to pay up to a thousand dollars for such a copy, whereas without these strange embellishments a bound copy would bring only fifty or sixty dollars.

No discussion of rare books would be complete without mentioning Americana which name covers a multitude of books which touch more or less directly upon the New World discovered by Columbus. Any book published before 1550 which so much as mentions the New World comes within this category; all books published in America before 1800 are also included. Early books of voyages and travel are particularly valuable as Americana, especially when containing maps or illustrations.

It is almost useless to try to place values upon the precious documents of human history which we have mentioned. Such records are found in America in several great collections. John Carter Brown has his memorial in the library at Providence; Lenox and Astor, of New York, have their memorial in the great New York Public Library; Ayer, of Chicago, has his memorial in the Newberry Library of Chicago; Huntington has one of the wonders of the world in his library at San Gabriel; J. P. Morgan has perpetuated his memory in a treasure house in New York; William L. Clements, of Bay City, Michigan, has erected at Ann Arbor a shrine to which from now on competent students of American history will come; Detroit has a fine collection on the Great Lakes Region, a tribute to the life-long enthusiasm of Clarence M. Burton. These collections are priceless. Such collectors are benefactors of the American people, true patriots whose names will be cherished by future generations.

The James River—Where History Was Made

Concluded from page 10

is sold in all the corn-raising sections of the country.

Tuckahoe is the oldest of the James River mansions west of Richmond. Originally it was a frontier settlement, for during the era when the Indians terrorized the Virginia colony, the law required for every 500 acres, "one Christian man, perfect of limb, provided with a well-fixed musquett or fuzee, a good pistoll, sharp simeter and tomahawk to live upon the land." The house that stands there today is bordered by towering elms. A box-labyrinth with its twisting, winding walks is a unique feature. Tuckahoe is the estate of the Randolph family. The names of some of the members scratched with diamonds centuries ago on the windows are still discernible. The estate is famed for its hospitality. Like most of the other Old Dominion mansions, it also has its ghost stories—the spook of a murdered peddler haunts one room, so rumor says, while the ghost of a distressed bride paces the east walk during the dead of night.

The Curl's Neck plantation, where Nathaniel Bacon and William Randolph once lived and concocted the inglorious Bacon Rebellion, gets its name from the twisting bends of the James River in that neighborhood. It is one of the most notable stock farms of Virginia. C. K. G. Billings now owns the place. It has been the training grounds of hundreds of the best race horses that ever faced a starter's flag. Such champions as Lou Dillon, The Harvester and Uhlan have made track records and grazed on luxuriant fields of blue grass at Curl's Neck.

The Human Appeal in Scrap-Book Philosophy

Virile Verses of Grace E. Hall Attract Wide-Spread Recognition

By MRS. NORMAN DAVIS

ONE day, while seated at breakfast in one of the small hotels in Eastern Oregon, I fell into conversation with the young man who shared my table. During the earlier part of the meal, he had seemed quite absorbed in skimming the headlines of the newspaper which he had propped before him, but as I finished my grapefruit, and poked questioningly at the eggs, I noticed that he had taken his cigar-clipper from his pocket, and was cutting a paragraph from one of the inner pages. As he stirred his coffee, he read and re-read this clipping, until my curiosity was thoroughly aroused. Finally, he glanced up and handed me the slip of paper.

Banging his fist down on the table with a vehemence that fairly made the sirup jug dance, he said:

"She hit the nail on the head that time. Watch me go out and get that Johnson order today!"

The broad-shouldered, red-blooded young man across from me hardly seemed the type that would absorb verse with his pancakes, but I noted that the clipping was just that—a bit of verse, signed "Grace E. Hall."

As I read the quaint bit of philosophy which had been so cleverly worked into rhyme, the salesman opened his wallet, and extracted some dozen or so well-thumbed clippings, which he passed over to me.

"I've never met Grace E. Hall," he went on, "but she seems to know me and my kind well enough to give us a message every so often that sort of straightens out the mean kinks in us. She seems to get pretty close to you women-folks, too, for at home the little wife has a scrap-book in which she pastes the kind of things women love to save, and I'll warrant you that a good two-thirds of those pasted clippings are signed by this writer. That's why they call her 'The Scrap-Book Poet.'

"I'm with a bank-note concern, and do considerable traveling through the western states. We salesmen get pretty well acquainted as we go along, and I think a student of psychology would be interested in seeing what we carry in our bill-folders along with the home snapshots, the blank checks and the business-cards. In nine cases out of ten, I'll bet you'll find not one, but several, of the poems of Grace E. Hall. There isn't much she hasn't written about that isn't sensible, wholesome and inspiring, and it would take a weak-minded person who couldn't find some bit of cheer or helpfulness in her daily verse."

When I repeated this last sentence to the woman of whom we were speaking, she laughed, with the infectious, girlish laugh that is part of her charm. "During the past year," she confided, "I have found that even the weak-minded get something from my verse, although I could hardly state that it has been helpful to them—and it certainly has caused *me* a great deal of annoyance.

"Last winter when I was in California, I received a letter, written in a German-American script, from a man who told me he had enjoyed my verses, and who wanted to meet me. He asked for my address. Naturally, I have to use care in these cases, so I simply wrote him that such a thing was impossible, and that the only way in which he could reach me was through the newspaper which published my verse.

"Upon returning to Portland, I found a book in my mail-box, entitled "Jail-Birds vs. Game-Birds," written entirely by hand. It was a strange mixture of philosophy, anarchistic sentiments, information on various subjects; in fact, it rambled on about a little of everything. Inclosed with it were personal letters, and a man's prison discharge. Letters began to arrive, both by mail and delivered by person (since they were slipped under the door in the latter case, I never saw the writer or messenger). After he had proposed matrimony, seeming to have the idea that I was a divorceé, I handed the matter over to the police, who apprehended the man, and he was adjudged insane. Later he was sent to the state asylum. While he was still there, other mysterious letters, written in a different handwriting, began to arrive, which became very annoying in their tone.

"This writer seemed to feel that we were already married, and when the police caught him, after he had left two packages at the house one day, he was quite indignant about it, and insisted that I was double-crossing him. The packages proved to contain a worn-out pair of man's shoes, with a note saying that since I had spoken of 'golden sandals' in my poem, he feared my feet might become cold, so he was sending me something better. Besides the shoes, there was a rough stick, with the notation that I might find some of my subjects unruly, so he was giving me a scepter with which to rule them!

"The examining-board found him insane, and just after they had packed him off to the asylum, Writer No. 1 escaped from there, and immediately began his letters again, so the sleuthing began once more, and continued until he was caught and sent back to his proper place. It seemed that he had given my name and address to the second writer while they were both at the asylum, and Writer No. 2, after giving the first man directions to escape, made his own way out, and tried his hand at the game!

"However, these are the only unpleasant and unfortunate occurrences in connection with the appearance of my verses that I can remember. On the other hand, I have had so many pleasant things happen to me, because of my readers wanting to show their appreciation, that it would fill a volume to tell of them. Some of my dearest treasures are the books and pictures that have come to me in this connection.

"People have told me," the recipient of these gifts related, "that I have a remarkable personal response to my verse, and I think perhaps this must be so. Never a day passes that I do not receive letters, several phone calls, visits or packages from those who have read my verse, and feel that they want me to know how it affected them, or else desire a poem along certain lines which they feel would be helpful to them. Naturally, I enjoy this; one likes to feel that one's work is doing a bit toward giving happiness and lifting others along the road. I do not tell you of this because of what *I* have done, but because of what these others are doing for *me*. It is these messages—these letters that have been my excuse for going on. I would have stopped writing long ago were it not for the encouragement that I have received from my readers.

"Had anyone in all the world given me any encouragement when, as a child, I first began to give indications of 'writer's itch,' I might have become a real writer—might, years ago, have won a name worthwhile. No one can rise above his present condition, if he has failed to make good in his own estimation. All he needs is confidence in his own powers. No strength comes from any other source, but the honest encouragement of others is a wonderful help, and we owe it to our fellows to speak out, and tell them they can do what they are willing to attempt—that it is a matter of application and self-belief. I honestly believe that half of our down-and-outers are what they are, simply because of the lack of self-esteem, self-confidence; and that many failures are blamable to the parents and the friends, who have failed to say an encouraging word at the crucial moment in their lives. And, too, I believe there is a real comeback in nine-tenths of these same men and women, if human kindness and interest in them were shown by the rest of us—not in the form of charity, but in real heart-interest, true desire to help them to get back self-power.

GRACE E. HALL

The scrap-book philosopher: probably the only woman writer of newspaper verse who is under contract.

"There is nothing in all the world that so kills ambition, so chills and depresses a human being, as the stolid indifference of the people with whom they are thrown in contact. The feeling—'What does it matter? Who cares?' may be a weakling's excuse, but it carries a powerful indictment of mankind."

Grace E. Hall's parents were New Englanders, but she was born in Illinois. The family moved West early in her life, so the greater part of her time has been spent in the Willamette Valley, and the last thirteen years in Portland, Oregon.

She told me that her earliest recollection was of being a very lonely little girl on an Illinois farm, without playmates except two older brothers.

"I was possessed of an intense love of horses," she said, "but a heartless disinclination for dolls. I still love horses, and I still have a dislike of the make-believe. I think that is why I am still lonely, too; I have never been able to be satisfied with the small-talk and sham of the social world. I cannot endure the superficial. As soon as I meet anyone, I want to get beneath the surface to know the real man or woman underneath the conventional form shown the world.

"From my first memory I have had an intense desire to know the 'why' of everything, especially of people's conduct—the innermost motives of actions; not as they appear, but as they *are*. An analytical mind that has been able to grasp values with a fair degree of accuracy has not, perhaps, added to the sweetness of life. Sometimes it is better *not* to see!

"My loneliness found an outlet in writing; bits of verse and prose were readily accepted by small-town editors whenever I offered them, but the glory was not sufficient to inspire me to continued effort. About the time I would have entered college financial misfortune befell my father, and I sought employment in a country town newspaper office shortly after coming to the coast. I enjoyed the work and the atmosphere. I served in every department, except that of the job work, and did everything one does in a newspaper office, except hunt for 'type-lice'! Anyone who has ever been around such a place knows how the 'greenie' is always asked to bend closely over the saturated type-forms, to hunt for these mites—only to have the wet mass 'bunched,' which throws a perfect geyser of inky water into one's face. My analytical mind refused to see where any such pests could cling to wet metal, so I refused to 'bite'!

"Gradually I became a news writer and reporter, and the last two years of my employment I did all the writing except the editorials, and occasionally I did those, too. For five years I did the correspondence for a Portland daily from this same country town.

"About five years ago, disregarding the advice of all my friends, I sent in some verses to the Portland *Oregonian*—one of the ten largest newspapers in the United States. These were accepted, and after a time, I decided—still against the advice of friends—to ask for payment for my work. Since there is, so far as I know, no woman in the country who is paid, under contract, to write newspaper verse, I was suggesting an unheard-of thing, when I broached my idea to the *Oregonian*. I believe there is no other woman who does just the sort of thing that I am doing—which is that of having regular space on the editorial page of a large newspaper, for which she is paid. For my paper immediately began to pay me for my verse, and I have been under contract with them ever since."

Just as book-dealers consider Edgar Guest as the "best seller" among verse-makers, so is Grace E. Hall declared to be the best-paid woman who does this sort of work. A year ago, when her first volume appeared, information was obtained from book-sellers throughout Oregon and the western states to the effect that her book of verses had received an unprecedented welcome and sale.

"Homespun" is the name of the little collection, the name being a fitting one for the type of poems it contains—poems which in the aggregate make up the fabric of life. It has never been the author's ambition to break into the world of books, but from the time of the first appearance of her verse in the *Oregonian*, she has had requests for such a volume. There are qualities in her work—qualities hard to define, yet undeniably there. Her poems were regularly read over Oregon, over the western states; they trickled East, finding friends wherever they went. That is how Dodd, Mead & Company, New York publishers, arranged with her to print the collection. They have recently brought out her second book, "Patchwork."

There is nothing of the abnormal about Grace E. Hall. She lives in one of the prettiest suburbs of rose-gardened Portland, and has a normal, interested and interesting woman's program. Her home is a *real* home, with soft lights, restful colors, good pictures, books and music.

The stamina of this writer's verse seems to be a reflection from her own virile strength. She is aglow with health, and keenly interested in the world about her. She loves the out-of-doors, and expresses this in much of her verse. One cannot meet Grace E. Hall without feeling her whole-hearted friendliness, which reaches one in her firm, quick hand-clasp, and warm, radiant smile.

The letters that come to her by the hundreds express what these readers feel. There are those from invalids, others from prisoners; many from the growing girl and boy, uncertain of the way to go. Some of the letters are pitiful, some are brave. One of the most tragic that the writer has received was from a man whose home had been wrecked, and in his later years; he had written, begging her to write a protest against divorce.

"Perhaps the funniest one I ever received," she laughed, "was from a dear old man in Washington, who said he always thought of me as wearing wings! Considering my splendid state of health and substantial build, it gave me a good laugh—although I am quite sure that is farthest from what the man intended.

"People often write or phone me asking for a verse to fit some occasion—a birthday, an anniversary—even a little sentiment at the time of a death. I gladly respond. This morning, I had a request to have a sentiment, in verse, in the hands of the jeweler by four o'clock this afternoon, as it was intended to be engraved upon a child's silver cup! I had it there by noon. It is never a task to prepare a verse in a given time.

"Recently a welfare worker called me up, and asked me if I wouldn't write something that would appeal to a wayward girl. It seemed she could not be reached by the worker, or by her mother—she felt especially bitter toward the latter, because the mother was not able to afford the things the daughter felt so necessary for her happiness. She felt her mother did not understand. For some reason, in the past, my poems had appealed to the girl.

In the five years in which Grace E. Hall has been contributing verse to her home newspaper, she has had more than a thousand poems published. For one period of thirteen months, one a day appeared from her facile pen. While some of her lines may lack the music of those of more widely-known poets, they never lack the potent message, wherein her readers find the answer to their own questions.

She disclaims being a poet, but calls herself a writer of verse. She writes with a homely philosophy, putting common-sense thoughts into easy rhyme.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Brazil is an enormous country comprising every zone save the Arctic and capable of producing all the fruits of the earth. This country, nearly the size of the whole of Europe, has a population not more than one-fourth that of the United States.

Man lived in Florida twenty-five thousand years ago, according to evidence found by Dr. F. B. Loomis, professor of geology at Amherst College.

The famous old ship *Constitution* lies rotting away at a dock in the Boston Navy Yard. A bill appropriating money to repair and save this patriotic old relic was shelved in the rush of business as Congress closed.

President Beatty of the Canadian Pacific Railroad is now visiting in Denmark in an attempt to divert flow of Danish emigrants to Canada from the United States. He offers special facilities and virtually free farm land in Canada.

Clemenceau is living in his garden, writing a book on political philosophy.

The district mounted patrol of the Krugersdorp (Transvaal) in Africa while destroying locusts on the boundary of the West Rand noticed one locust with a white body. He captured it and found tied round its body a piece of paper bearing the message "Farmers do your best—26-5-24, Christiania." The distance between Christiania and the place where the locust was captured is more than 200 miles, and the locust dispatch flyer must have covered the distance with a swarm about a mile long in twenty-four hours, which included a rest overnight.

Robert Raikes, a Gloucester (England) printer and publisher, in 1780 noticed some urchins playing in the street on a Sunday morning, gathered a number of them together and formed them into a class for private religious instruction. This was the beginning of Sunday schools.

A committee reporting to the American Bar Association brings to light the fact that in the examination of the law courses of twenty-five of the leading schools of this country they found that a study of the Constitution is compulsory in only nine of them, and in two of those attention is given to the purely commercial or legal value of it.

Less than two per cent of the total land of the United States is now irrigated, yet reclamation has reached the stage where future progress can be made only through the construction of extensive storage works or the use of underground waters made available by pumping.

The Mexican Government has decided that no military commander in any section of the republic shall remain in office permanently, but that all such commanders shall interchange offices frequently. This step is aimed at preventing the development of political machines, which are said to have been largely responsible for the last revolution.

Zane Grey, author, is credited with landing the largest swordfish of the season. On July 15 he caught a four-hundred-fifty-pound monster with rod and reel, after a battle of several hours in Catalina waters off the coast of California.

The maids and matrons of the Italian Young Women's Catholic Union are pledging themselves to modesty in dress both inside and outside the church in Italy.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Mrs. Grace Rogers, sister of Paul J. Rainey, the well-known hunter, has presented twenty-six thousand acres of land in Louisiana to the National Audubon Societies, together with a large endowment for the boarding of hundreds of millions of wild duck every winter. It is to be known as the Paul J. Rainey wild life sanctuary.

Speeding across Mica bay, on Coeur d'Alene Lake, Idaho, in a war canoe, a group of Campfire girls from Camp Sweyolakan prevented the spread of a raging forest fire which threatened several farms in the district. With shovels, hatchets, buckets and every available implement, the girls threw a trench 100 feet long by 20 feet wide about one end of the fire and brought it under control. An all-night vigil was kept over the fire area, the girls taking turns at standing guard while the others rolled up in blankets and slept.

Unoccupied fields in Marinette County, Wisconsin, will be sowed to buckwheat this summer and the crop fed to prairie chickens in the winter by members and officers of the Izaak Walton League at Marinette and the Marinette County conservation clubs.

Sixty per cent of the guests of the Clifton Hotel at Niagara Falls are honeymooners. The general manager says they don't eat much of *anything* and those who do eat don't care *what* they eat. They are the easiest people to please. All they want is to be let alone.

A division of fast destroyers of the British Government have been dispatched to co-operate with vessels of the French and Italian navies in curbing the slave-trading *dhows* that ply between Africa and Arabia.

It is said that 200.000,000 pieces of mail are yearly given "directory service," which means that postal employes must take time from the regular handling and dispatching of mail in the endeavor to provide correct addresses for this huge volume of misdirected matter. This service costs approximately five hundred dollars daily in the city of New York alone.

At a sale of early Chinese porcelain just recently held in London, two bottles of the Ming period were sold for the fabulous sum of $32,000. The bottles are turquoise blue and richly crackled.

The Federal Government has collected $589,000,000 since 1917 in taxes for motor vehicles and has paid out $264,000,000, or forty-five per cent of this, for Federal and state highway funds.

Washington aviators are buying powder puffs by the carton. They place a puff over each ear and then buckle on their helmets. Ordinarily when going into high altitudes they must stuff their ears with cotton and the powder puff is more comfortable.

The twentieth amendment to the Constitution, if it is ratified in time by the required number of states, will be that giving Congress the power to regulate the labor of children under eighteen years of age.

There are eight million more women than men in Europe.

From duties levied in Tarifa, a port city on the Strait of Gibraltar, on all merchandise in ships passing through the strait in Moslem days has come our word "tariff."

The United States Department of Agriculture is about to establish a forest experiment station in the Pacific Northwest to determine the best method for the restoration of the forest in the cut-over land of that region.

A journey from Haifa, Palestine, across the desert to Bagdad which two years ago took about two weeks, is now being made in four days. This is due to the operation of a motor bus service between the two points.

A murder a day for June and 177 since the first of the year is Chicago's record, according to the report of the Chicago Crime Commission. April, with thirty-three homicides, had the largest number.

The original Olympic games date back to 776 B. C., which is the accepted date of the first Olympiad. The Paris Olympic games this year were the eighth of the revived series which began in Athens in 1896.

The largest elevated water tank in the world is being erected in San Diego, California. It has a capacity of 1,200,000 gallons.

The lowest proportion of foreign stock in any section of the country is in the east south central states of Kentucky, Tennessee, Alabama and Mississippi. Here only three per cent of the population is of foreign stock and but eight-tenths per cent foreign-born.

In proportion to the number of inhabitants, Alaska has the most intensive radio development of all lands. It seems to have been especially devised to fit the needs of these people, because while they are cut off from many settlements for six months of the year by the snow, the icy blasts are no obstacles to the electromagnetic waves.

The most important library in the world, according to the number of volumes, is the National Library in Paris which has 3,500,000 books.

The value of the products of all the states' prison industries during the past year was $69,000,000; of this prison-made work, clothing was valued at $19,000,000.

As a result of a terrific maritime convulsion a new island has sprung up in the Sea of Azov, an arm of the Black Sea. The island is a dangerous impediment to navigators and beacons have been erected to warn the approaching ships.

Greek Temple at Paestum.

WE REALLY know so little about the Italian in America that our slang name for him is itself a misnomer. The name "Diego" or James is frequent among the Spaniards. The term was picked up by our mono-tongued fellow citizens, the Yankee sailors, in their voyages along the coast lands to the south of us, who used it to designate all those who spoke Spanish or Portuguese. Later it was used to include all dark-skinned, foreign-speaking people in the coastal cities of Latin-America. In the United States today it has come to apply largely to the Italians.

We commonly fail to differentiate the people who come to us from Italy, but all Italians are not simply short, dark-skinned men of a single type.

The earliest people in Italy whose identity is known were a branch of the great Mediterranean race—the same race who first settled Greece, and akin to the Iberians who early overran Spain, France, and the British Isles. They were an adventurous, seafaring folk, swarthy or with olive complexion, and black hair. They were dolichocephalic, or long-headed, and of relatively slight, short stature. This ancient type is still found in large proportion in Calabria and parts of Apulia in Southern Italy, and in Sardinia.

At a much later time, probably beginning about 4,000 years ago, there came into Italy, in succeeding periods, from the north and the east, pre-Celtic people of the Alpine race. Occupying at first the lake regions of Northern Italy, these broad-headed people gradually extended southward to the plains of the Po and across the Appenines into Tuscany as far south as the Tiber, blending with the earlier long-headed race. Their occupation of Northern Italy was broken some time about 1200 B. C. by the invasion of other peoples of long-disputed and still uncertain origin coming from the north and perhaps also from the east—the nucleus of whom was long-headed and probably proto-Teutonic.

Ruins of Roman Theater, Timgad, Africa, in desert on way south to the oasis of Biskra.

These new invaders spread over the valley of the Po and extended their conquest across the Appenines into Etruria and Umbria. Following this new invasion in the north at a date undetermined, but at about the year 1000 B. C., an original and distinctive civilization known as the Etruscan was built up.

The Etruscans thus were a mixed people among whom the early Mediterranean race formed a certain part, with a larger per cent of Alpines, and a considerable per cent of long-headed people of the later invasion. The Etruscans were a wealthy people dwelling in a league of twelve cities and having a very advanced culture—as inspection of Etruscan jewelry, bronze household utensils, pottery, terra cottas, and glass, in the museums of Italy and in our own Metropolitan Museum of Art in New York will abundantly prove.

While the Etruscans were flourishing in Northern Italy, in Southern and Central Italy Greek colonists were coming into the country. So widely did the Greeks settle in Southern Italy that it received the name of "Magna Graecia," and until an advanced period in the Christian Era Greek customs and language prevailed there in some districts.

In the Greek ruins in Italy one can still see with what art and beauty the Greeks permeated all life. Most notable, perhaps, are the ruins of the theater at Taormina, in Sicily, on the site of the ancient town of Tauromenium, dating from the fourth or fifth century B. C. The view today from the hill on which the ruins of the theater stand is one of the most beautiful in Italy. One sees not only the pyramidal Mount Etna, but half a dozen other towering peaks crowned with castles —truly "castles in the air"—while below is the city itself perched on a cliff overlooking the Mediterranean, which stretches far away in the distance southward.

The best known Greek ruins of Italy are the Temples of Paestum, close by the Mediterranean Sea, south of Naples on the site of the ancient city of Poseidonia, "City of Neptune," founded about 600 B. C. The three temples are the finest specimens of pure Greek architecture outside of Athens. Five hundred years before Christ lived those temples looked upon a thriving city and an advanced civilization.

Between the Etruscan culture on the north and the Greek colonies on the south, there developed other peoples in the central part of Italy—important among whom were the Sabines and the Latins. The Sabines seem to have been akin to the Etruscans in origin. By the fusion of the Sabines and the more homogeneous Latins and other kindred peoples of Central Italy the Rome of history emerged, the tongue of the Latins prevailing over other dialects. With this rising power of Rome, and new invasions of Alpines from the north, the Etruscan civilization was absorbed and overthrown.

What can we say of the glory of that Roman civilization? The history of the Roman Empire belongs not to Italy, but to the world. Its system of laws is the basis of the legal systems of the civilized world of today. Not only do we find marvelous Roman ruins in Italy, but scattered over Europe and along the shores of the Mediterranean.

Far down in the desert sands in Africa are the ruins of the great city of Timgad. The streets with worn and rutted pavements, with temples, market places, theaters and dwellings, attest the busy life that was once a part, even in this distant spot, of the great Roman Empire. In Spain, in France, off the busy Strand in London, out from the city of Budapest in Hungary, we find still the ruins which show what Rome once was. And still farther eastward Roman soldiers and colonists fixed their name, and, in part, their language on a Slavic people who are known today as the Rumanians.

What shall we say of the mixture of races in Italy when "all roads led to Rome"? Alien legionaries, immigrants and invaders, peoples from the ends of the known earth centered there: Greeks, Spaniards and Portuguese of the Mediterranean race; Egyptians, Moors and Negroes, bond and free, from Africa; Gauls and Celts and Slavs of the Alpine race; Goths, Vandals and Lombards of the Teutonic race; Huns, Jews and Syrians; Arabs and Saracens from Asia—all came to Italy when Italy was Rome. Until, as a Roman writer said, the Orient had emptied itself into the Tiber, and the Eternal City became a *cloaca maxima,* the universal sewer of the world.

Of the many reasons given for the fall of Rome, her diverse unassimilated aliens must be considered an important factor.

From the earliest time of Gothic legionaries and invaders, to the day when Genseric the Vandal sailed up the Tiber and Rome was sacked, and on to the present day, the Teutonic racial element has been strong among the Alpine Italians of the north.

In Southern Italy the mixture of races was not yet complete. From the ninth to the eleventh century Sicily was overrun and her cities conquered, one after another, by the Saracens or Mohammedans of North Africa, thus adding Arab blood, doubtless with dashes of Berber and Negro. And again during the first half of the eleventh century while William the Norman was leading his victorious forces into England, his cousin, Roger the Norman, was conquering Sicily.

Traces of those northern men are yet visible. Many times I saw persons on the streets of Palermo whose eyes were lighter than brown, and there was also striking co-ordination in individuals of taller stature and lesser pigment.

However, the period of Norman domination witnessed a new Latinization of Sicily. This was due to the conditions of toleration which openly permitted all peoples to come and to retain their culture, and to the fact that Latin peoples and culture, being the most numerous, survived.

In Palermo we find the most important monuments of Norman art—the palace of the Norman Kings, the Chapel of King Roger II, and the famous cathedral of Monreale built by William II.

Of the history of Italy during its brilliant renaissance and the centuries following, of the rise of the republics and the duchies, of the subjugation of various parts of Italy at different times by the Spaniard, the French, the German and the Austrian, it is not here our province to deal.

An intimate picture of the sixteenth century Italy in one of these duchies, that of Milan, may be seen in *the* great Italian novel, one of the world's great novels, Manzoni's "The Betrothed." The reader will there get a view of Italian peasant life in those days—of political, social and religious conditions. He will see famine, pestilence and armed foreign foes stalking through the land. And above it all and through it all he will find a psychological analysis of character and a presentation of eternal moral and religious truth unrivaled in any novel of which I know.

For many centuries the history of Italy was that of political instability and consequently of petty disunion. And so fixed did the differences of those centuries become that even today we have in the different provinces of Italy different dialects, different folk songs, different customs—almost different peoples. Piedmont, Venetia, Lombardy, Tuscany, Umbria, Abruzzi, Campania, Apulia, Calabria, Sicily—each produces its distinct type.

Today we find these provincial differences perpetuated in America, especially among the 700,000 Italians in New York City. In the heart of the city one finds in the Italian colonies a Sicilian, a Neapolitan, a Calabrian quarter, each with its peculiar traditions, manner of living and dialect.

"We Italians," says one of them, "like to live with people of our own province, who speak our own dialect." This suggests the extreme educational need of such broken groups before they can grasp and practice the American unified type of nation-wide representative government.

More than provincial differences, it is most important to note that the racial history of the north of Italy has been different from that of the Italy of the south. The race and conditions of the northland have produced a different Italian from those of the southland. So different are the two peoples that our government keeps the North Italian distinct from the South Italian in our immigration records; it classifies the South Italian as Mediterranean, and the North Italian as Alpine.

And it is anthropologically true that from the earliest time the largest single racial element of Southern Italy has been Mediterranean, and from the time of the prehistoric Alpine invasions Northern Italy has been predominantly Alpine. However, the northern culture has been somewhat modified by the long-headed invaders and especially by the almost constant historical inflow of the Teutonic tribes. The differences between the people of Northern and Southern Italy show not only biologically, but in all phases of their political, economic and social life.

For those who wish to understand the Italians in America, a knowledge of the geography and something of the history of Italy is thus indispensable. Calabria, Lombardy, Abruzzi, should have a meaning for one in relation to its respective people and history. The recognition also by the Italian of one's knowledge of his particular province will be an open sesame to his heart.

One needs also to have a feel for the beauty of Italy itself—a near landscape of vineyards often hanging between earth and sky, of olive orchards and citrus groves against a mountain background. The Italian some-

Uncle Sam's Junior Farmers

Agricultural Club Boys and Girls Raise Crops and Livestock; Youngsters Using Scientific Methods Excel Their Parents

"Heh, boys, can you beat these for 'spuds'?"

By GEORGE H. DACY

AGRICULTURAL club boys and girls to the number of 457,904, representing every state, last year produced more than $8,300,000 worth of food products under the active leadership of the national Department of Agriculture.

None of these youthful farmers were more than eighteen years of age, yet they showed skill, sagacity and experience in tilling and tending their miniature crops which was far and above the ability displayed by the average good agriculturists of our best farming sections.

Uncle Sam has adopted the novel policy of teaching the old through the young. When a champion club boy of a certain section produces a remarkable crop of corn or potatoes, you will find the elders of that community stealing his thunder the following year by copying his system of planting and method of management. The club demonstrations of children in their teens have been more effective in revolutionizing the farming methods of a hidebound district than all the "isms" and dogmas of science.

The juvenile "spud" farmers of Garland County, Arkansas, latterly organized a co-operative marketing association and manipulated the successful sale of a large potato crop which they grew at profitable prices. Ninety-eight boys and girls planted one-eighth of an acre of potatoes apiece under the direction of the local county agent. They followed the planting, tillage and harvest methods recommended by Uncle Sam. The average yield was 220 bushels to the acre. The young farmers bulked their crops at marketing time, shipping one carload of choice "spuds" to Kansas City while the remainder was sold to the resort hotels at Hot Springs. A net profit of seventy-four cents a bushel was the cash turnover of each young grower. This demonstration was epochal in popularizing modern methods and co-operative marketing in Arkansas.

For scores of years, the farmers of the countryside contiguous to Brookston, Indiana, have raised corn by a cut-and-dried system which is as venerable as the settlements thereabout. Thirteen club boys decided it was time to root their community out of the rut. They banded together and rented a 102-acre cornfield on a main-traveled highway close to town. They purchased purebred seed and costly fertilizer. They prepared the land in ideal fashion. Their "dads" and their fathers' friends scoffed at the boys and called the cornfield "folly's acres."

Harvest time, however, put the laughter on the other side of the fence. The average corn yield of Indiana's fertile black soils is less than forty bushels to the acre. The junior farmers, following the best modern methods and taking advantage of every economical opportunity to increase their crop profits, produced an average corn crop of more than eighty bushels an acre. One of the club boys harvested an additional five-acre crop of corn on a neighboring field which produced 100 bushels to the acre. The corn-growing achievements of the Brookston youngsters have wholly reformed the ordinary methods of the neighborhood. "To see is to believe" with the average Hoosier farmer. The Brookstonians were of this type. They saw, believed and followed suit. Their locality is now being groomed as one of the pre-eminent corn-growing sections of the entire state.

Down in Spalding County, Georgia, cotton-growers were feeling rather glum because their fields were not yielding as well as formerly. It remained for some of Uncle Sam's champion junior farmers to show them the way out of the difficulty. These boys tested the soil and found what fertility elements were lacking They supplied these in commercial fertilizer. They used the best seed obtainable of a variety that was adapted to that district. When the plants were up, they dusted them regularly with a poisonous chemical which put the destructive boll weevil to flight. Briefly, thirty of the club boys raised thirty bales of cotton on thirty acres of land. The cotton was sold at auction for fifty cents a pound. This simple and practical demonstration has been the basis for remodeling the cotton-growing methods of the county and increasing profits.

These farm club girls make all their own clothes under the supervision of the local farm woman demonstrator.

Fred Crow, a pig club boy of Rocky Ford, Colorado, has been interested in hog raising for several years. First, he raised one purebred pig, then another. Last year, at the age of seventeen, he raised and fattened twenty-five purebred porkers. At the age of eight months, these fat swine averaged 270 pounds apiece. He exhibited the fat stock at the Denver Livestock Show, where he won two leading prizes for the best carload lot of porkers. Subsequently, young Crow sold the hogs to a Denver packing house at ten cents a pound. His farming enterprise yielded him a net profit of $270—a remarkable accomplishment for a high school boy and an immeasurably efficient inspiration to the farmers of Colorado.

In Harford County, Maryland, seven groups of agricultural club boys and girls imported 115 purebred dairy calves into the county in a three-year period. They paved the way for the extermination of the "star boarder" cows from Harford stables and the substitution of registered stock for "catch-as-catch-can" cows. For example, eighteen-year-old Roland Davis now owns nine purebred Jerseys which he has raised. In the showing at the county fair this boy's entries defeated those of his father in all the classes. Other junior farmers did as well. Their parents finally got together and purchased registered stock and adopted modern methods, convinced by the practical results of their children that the new ways were the most efficient.

Three of these crack juvenile farmers won the livestock judging honors of the United States at the National Dairy Show. As a result, all their expenses were paid to London, England, where they competed against the best boy judges of Great Britain—and won. During the current year, three Illinois boys are making the same trip, having been selected as the best young judges of America. The chances are that this trio also will show the British youngsters how to pick the winners.

As a direct consequence of the outstanding success of her junior farmers, Harford County has undergone an agricultural reformation which has entirely revamped her farming systems. At present, ninety-eight per cent of all the dairy herds in the county have been tested and certified by the Federal authorities as free of bovine tuberculosis. It used to be that the average dairy cow of that county ate twenty-five dollars worth of feed more each year than she returned in marketable dairy products. Now, praise be to the teachings of the agricultural club boys, the average Harford dairy cow returns a clear cash profit of more than $300 a year.

Louise Calloway, of Griffin, Georgia, is one of the enterprising club girls in Uncle Sam's result-getting army of youngsters who has hung up a wonderful record. From a small package of pimiento seeds which she received from the national Department of Agriculture, this slip of a lass established a specialized pimiento garden. Last season she sold in excess of $2,000 worth of pimiento pulp to a canning factory of her community, in addition to disposing of considerable seed. She will use the money to pay her expenses through the home economics course at the state university.

Ewart Brownell, of Brookfield, Connecticut, is one of the proficient poultry fanciers of the country. Latterly, twelve of his purebred Rhode Island Reds produced an average yield for one laying season of 206 eggs a bird. Young Brownell deposited in the savings bank a profit of $5.47 above feed cost per fowl—an outstanding record, as anyone familiar with poultry will immediately recognize.

The girls' sewing clubs and junior homemaker organizations are quite as efficient in their work. Approximately 150,000 young girls were members of these clubs during the last twelve months and made 493,376 new garments and repaired 16,000 old ones. The 33,000 agricultural boys and girls clubs under Uncle Sam's supervision scattered throughout the United States are the most potent factors that are making for the upbuilding and improvement of American agriculture.

One of Uncle Sam's agricultural minutemen—a county agent—shows club boys how to select seed corn.

A pig club boy; his two purebred Duroc Jersey sows and their pigs.

Any American boy might well be proud to own such baby beeves as these.

General view of the harbor, Nantucket, Massachusetts.

Quaint Old Nantucket

Once Famous; Now Artists' Paradise

By F. N. HOLLINGSWORTH

A PARADISE for artists is the quaint little island of Nantucket, thirty miles out at sea, off the Massachusetts coast. Not the Greenwich Village type of artist, with bobbed hair and bare knees, dabbling in batik, free verse and Turkish cigarets and holding "Bohemian" revel, nor the long-haired Bolshevik male poseur—but the real, honest-to-goodness artists, who paint real pictures that discriminating people buy for their art qualities.

Once the "Glory of the Seas," rich and prosperous from its far-flung whaling industry, known the world over for its hardy seamen and sturdy ships, Nantucket suffered many reverses from the decadence of its industries and the successive wars that took such toll of its manhood and wealth that the whaling ships were swept from the seas, while picturesque old fish houses, oil works, cooper shops and seamen's cottages were empty and neglected.

Today Nantucket's greatest assets include these same forsaken old shacks and low-roofed cottages, along with her splendid sunsets, her ever-shifting sand dunes, the changing color of her moods; her rocks and shoals and deep booming surf; her quiet and peaceful isolation; her balmy air, and her many relics of the past.

The artist colony is not so very big, as yet: not so big, perhaps, as those at Provincetown and Gloucester. But then the entire population is not very big, anyway. Only 1,200 or so in winter and at the most ten thousand in summer when the hotels, boarding houses and privately owned cottages are filled with visitors. Nevertheless the artist colony has become an important factor, and has attracted a very desirable class of people to the old town, along with some wealthy "off-islanders" who make the island their vacation home, and they give a new note of color to the always picturesque streets. In the streets, as along the beaches and dunes, on the moors or up on the cliffs, perched upon the rocks, may be seen any day the artists at work with brush and canvas or pencil and sketch block.

Almost in the gutters of the narrow, winding streets one may stumble against easel and stool of some artist busily at work, unmindful of passers-by. They find many a picturesque human subject in the old-timers, too, as well as the Portuguese fishermen who supply the hotels and townsfolk. They can find many families who still have the heirlooms inherited from their Quaker ancestors, queer bonnets, shawls and dresses, which they sometimes don for the painters. Then there are the plump little dark-eyed babies and olive-tinted girls of the fishermen, who are always willing models for the artists, many of whom dwell among them on Whale street in the studios remodeled from all sorts of old fish houses and shacks. Then there is the town crier, still an institution, and an important personage. Nantucket is one of only two towns in the country which still retain the town crier. His duties are manifold, for he has a multitude of announcements to make as he walks with measured tread through the town; rings the old Spanish bell three times a day, at seven, noon and nine at night, when the natives are supposed to put out the lights and go to bed; and acts as auctioneer and walking encyclopedia on occasion.

The daily auction market, too, furnishes much material for the artist and interests the visitor. A curious custom is the disposing of any surplus stock at the butcher shops by auction. The meats are displayed on a bench in front of the shop and after the town crier has gathered a good-sized crowd, the sale begins. Potatoes and other produce are auctioned off this way whenever there is a glut in the market. These auctions are a very ancient custom at Nantucket and are so successful that frequently a sale is held every evening.

Strictly speaking, there are two artist colonies; one of them over at Siasconset or "'Sconset" where the studios cost more, or the artists own their own property, and the newer one in the Whale street district of the town among the fishermen. This new colony is due particularly to the efforts of Mrs. Florence C. Lang, herself an artist, who realized the difficulty artists have in finding suitable quarters at anything like reasonable rental, where subjects for their work can be found at every turn. She has led in the remodeling and renovation of the many ancient buildings into studios with kitchenettes and modern conveniences which are rented to artists at as low as $50 and $70 for the season.

The biggest studio apartment is the Harbor View, and another noted one is the Candle House Studio. This is an old building where once the women dipped the candles that lighted the stately old mansions and the more humble cottages. The Anchor House is another, that has a huge anchor hanging on the outside. Among the artists foregathering on Nantucket are Alice Sands, A. F. Murgrave, Helen Whitney and F. X. Ludwig.

Few places in America have more, perhaps, to offer the artist. Everywhere that one turns in Nantucket there are visible reminders of the early settlers, the departed whalemen and seafaring generations long past, that considered $50,000 a fair profit for a single voyage. There are traces of their handiwork in doorknobs fashioned from whalebone, or shell pictures on the walls of some old cottage, with strange trinkets and souvenirs brought from distant savage islands where their ships had touched. There is the old windmill, one of the curiosities of the island, probably the only one of its kind in America, in that it has wooden gears. It was built in 1686 and ground corn as late as 1892.

On the roofs of many of the houses are still seen the "captains' walks," narrow platforms like the bridge of a ship, perched on the ridgepoles, from which the owner or his family searched the horizon for signs of island ships returning from distant cruises. Old costumes, queer, antique vehicles, now never driven, shearing carts used in more leisurely days to convey the villagers to the sheep-shearing festivals, are routed out and sketched. The sheep still pastured on the "sheep commons" afford many pastoral subjects for painters on the moors.

Indians called the island Mantuckes, and their tradition is that Mashope, a mighty warrior, formed the island by dumping his pipe into the ocean. The frequent fogs about the island were attributed to the smoke from Mashope's pipe.

Geologically speaking, the island is only about fifty million years old. They tell us that it was dropped by the great Labrador glacier into the ocean and the turbulent Atlantic has ever since been molding it, wave and current raising the sand cliffs at Sankaty Head, smoothing out beaches at either end and making ponds and lagoons by cutting bays and then filling up their mouths with sand; the while making dangerous shoals about the 88 miles of coast line.

Historically speaking, Nantucket is 282 years old. It was discovered by Bartholomew Gosnold in 1602 while cruising in the bark *Concord*, but the first authentic records date from 1641, when the island was deeded to Thomas Mayhew by the Earl of Sterling. It is only fourteen miles long and about three and one-half miles wide, and is only four hours sail across Vineyard Sound. It is now accessible the year round, by steamer, excepting in the severest weather. A telephone cable, laid in 1917, now connects it with the mainland, but in earlier years the island was often icebound for weeks at a time, and the inhabitants were often hard pressed for food.

In spite of its small size, the island is replete with quaintness, natural scenic beauty and ruggedness. Even with its isolation there is much to keep it in touch with the outside world, for it is directly in the path of that enormous north and south bound coastwise traffic and almost directly in the great ocean lanes frequented by the ocean liners bound to New York and Boston. As they pass Nantucket Lightship, off the Nantucket Shoals, the farthest from shore of any lightship in

the world—42 miles—they exchange wireless messages, and report to New York when over 200 miles away from that port. Recently the radiophone was added to the wireless equipment, so that the lightship keepers can "listen-in" to broadcasts on the mainland and keep posted on all the latest news, as well as telephone or telegraph information ashore.

While the resident population has diminished by two-thirds since the palmy days of the whaling industry, the old town of Nantucket and the many scattered houses on the other parts of the island stand as they did, practically in those days, with the added modern conveniences of electric lights, town water and open plumbing. Many pretty summer cottages, bungalows and studios have also been built, as well as a few hotels. There are none of the great spraddling hotels of the usual summer resort type, however, and no one wants them. People come there for rest, quiet and a real vacation. For a number of years there was a little one-lunged railroad that ran across the island, the chief feature of which seemed to be to break down when the little train was halfway across, leaving the passengers to make their way on foot as best they might. Autos were fought tooth and nail by the townsfolk for years, but recently they have been permitted on the island under certain restrictions. The streets are so narrow, however, and the outside roads so rutted that there is small comfort in using them.

A sailor on one of the old Nantucket whaling ships, watching a California clipper ship pass his, while hove-to off Cape Horn, with her passengers, Philadelphia-bound, waving to the whaling crew, said mournfully: "Gol durn it. I wish't I was back in Nantucket." And thousands of other people, visitors to the island in years gone by, vacationists who had no opportunity to return, as well as the many Nantucketers who have gone to seek their fortunes elsewhere, have echoed the old whaleman's wish.

The old town, with its crooked streets, the shore with its dangerous shoals, rips and tides, its fine beaches; the rolling "commons" covered with wild roses and the balmy air where "nervous prostration melts away like lard on a hot pancake griddle," have etched themselves on the visitor's memory and found a soft spot in his heart.

Although Thomas Mayhew bought the island in 1641, he never settled there. Eighteen years later he sold to nine others equal portions of a part of the island for "thirty pounds and two beaver hats." These men were Quakers and took as partners, selling them shares, some other men, also Quakers. They were very rigid and strict in their rules, and always bitterly opposed to any improvements, greatly retarding commercial progress. During the Quaker domination life was almost unendurable, even the simplest forms of amusement being tabooed. This rule of bigotry continued for a century. But the hardy whalemen, after contact with the outside world, brooked less and less of this spirit, until it finally died out, except here and there in some few families.

When the island was first settled by these Quakers, that part of it not occupied by the Indians, or on which "sachem rights" had been purchased, was parcelled out by agreement, a part being reserved as common grazing land for sheep and cattle, and called "sheep commons." A sheep commons consisted of 1-19440th of all the land on the island, when it had all been acquired from the Indians, and was an undivided fractional part of a very uncertain something else. This system of holding lands in common for the benefit of the entire community was brought from Scotland, and, according to the Scottish system, five geese commons equaled one sheep common; eight sheep commons, one cow common; two cow commons, one horse common. A holder in commons could only pasture as much livestock as he had commons to correspond.

The sheep and farming industries declined and whaling had its rise and fall, first because of the many vessels lost during the Civil War and later owing to the discovery and development of the petroleum industry. The once big fleet of over 150 vessels, with 2,000 whalemen is now no more. Many Nantucketers left the island to seek their fortunes elsewhere, and the population dwindled from around 12,000 to a third of that. Nantucket, once the "Glory of the Seas," dropped behind in the race for power and place until its rebirth as a summer and health resort.

Today the largest vessel seen in the harbor is the steamer which brings passengers, mail and freight from Woods Hole and the sailing vessels are catboats, fishing sloops and small pleasure yachts. And in the five resort months the population is swelled to around ten thousand temporarily. Nantucket is prosperous again, but this prosperity comes to her year after year. The Middle West is largely represented in the vacation colony, and there are millionaires from New York, Boston and Washington who have summer homes there on which they pay considerable in taxes and which they spend much money to keep up. So Nantucket does not now feel the pinch of poverty, though there have been times in her history when she did.

The "Inventing" of Austria-Hungary

How the Latest Achievement of the League of Nations in Hungary Is Proving the Wisdom of a Century-old Saying

By HUGH A. STUDDERT KENNEDY

This article is presented not only for its wealth of interesting information but to illustrate how human and readable foreign politics can be made. Read here how artificial economic boundaries, the consequence of artificial political boundaries, affect real people in real ways. And when you read ask yourself whether any literate person should be destitute of world opinions, when world facts can be so simply and clearly and humanly presented.—*Editor*

IT WAS Talleyrand who said, more than a century ago, that if Austria-Hungary did not exist it would have to be invented.

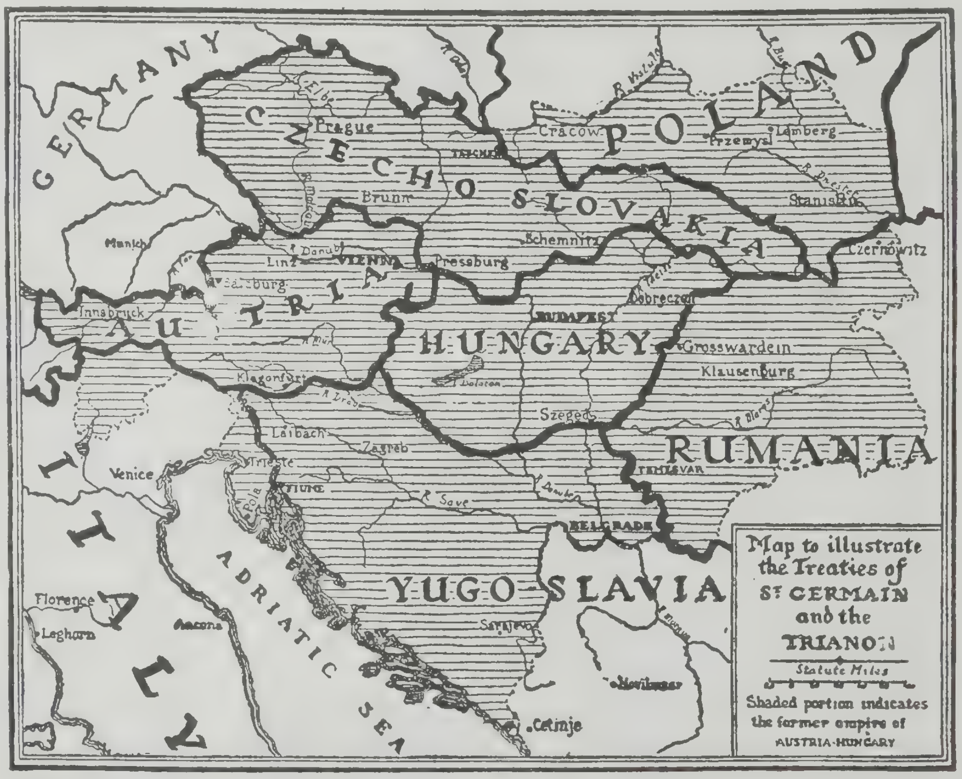
What, exactly, did he mean?

Talleyrand certainly had no particular faith in the excellency of government which emanated either from Budapest or from Vienna; but Talleyrand knew his Europe as few men of his day knew it. And he knew how, for centuries, in this part of Europe, all roads had led to Vienna. He recognized, even in those days, before railways had come to reinforce his view, that it would be impossible to throw a barrier across these roads without occasioning untold suffering to the peoples on either side of the bar. Now, it was just this great fact, so evident to Talleyrand, that the framers of the treaties of St. Germain and Trianon, which settled the fate of Austria-Hungary, left so largely out of account. And it was just this fatal defect in these treaties, this ruthless cutting athwart of old trade routes, this blocking up of rivers and turnpiking of roads—it was just these blunders, constituting a bad economic settlement, which a fierce economic pressure has been obliging the parties most concerned to remedy ever since.

Gradually the succession states, in other words, those states such as Czecho-Slovakia, Poland, Rumania, Jugo-Slavia, and Hungary, which have, in whole or in part, been formed from the old dual monarchy of Austria-Hungary, have come to realize that to cut themselves off from Austria and each other was simply suicidal.

Such a realization was inevitable sooner or later. If there is one great fact which has been emphasized more than another in the realm of international settlement during the past few years, it is this: that, *while a bad political settlement may be made to last indefinitely, a bad economic settlement is bound to give way sooner or later* before the imperious economic demand which it outrages. It is for this reason that, among the achievements of the League of Nations, none is likely to be more far-reaching than the work which has been done toward the rehabilitation, first of Austria and now of Hungary, and the steady efforts that have been made to bring about *the removal of all economic barriers* as between the succession states.

And yet, the setting up of these much to be condemned barriers was, in the first instance, understandable enough. The position is soon stated. In relation to the rest of the dual monarchy, Austria, and particularly Vienna, stood in the nature of a great clearing house. Not only did all the threads of Austro-Hungarian finance, but all the threads of Balkan finance, center in Vienna. Vienna, in the fullest sense of that word, was the shopping center for this whole vast territory. It was to Vienna that the choicest goods were sent, not only from all the states of the monarchy, but from far beyond. It was here that buyers from all over Europe gathered, and it was here that all the great displays and exhibitions were arranged. Wealthy people from Prague would come down to Vienna to buy carpets made in their own country, because in Vienna they always had a better choice than anywhere else. It was to Vienna that wealthy people from America traveled to buy pianos made in America, because they had been tested and adjusted by Austrian musicians.



Map further shows the way in which the new boundaries cut across lines of communication in the form of the Danube tributaries.

And what was true of Vienna was, in a measure, true of many other cities in Austria. Austria proper, immediately before the war, had attained a position where her wealth depended almost entirely upon her activities as a middleman. Immersed in this work, she gave little thought or attention to developing those industries which would make her in a measure self-contained.

Then again, in addition to this perfectly legitimate activity as a middleman, Austria, through force of circumstances, had gradually drifted into the position of being the playground and the fashion center for the wealth of the old monarchy. In spite of the fact that the Czech, or the Hungarian, or the Slovak, or the Jugo-Slav, or the Croatian, was in bitter opposition to the government at Vienna, it was to Vienna that they traveled for its lights and its gaiety and its fashion. So enormous was the concentration of wealth in Vienna, that it was calculated that fully eighty per cent of the taxes of the old monarchy were paid by the great city on the banks of the Danube.

It was this last fact, above any others, which fired the imagination of the succession states immediately after the conclusion of the treaties of St. Germain and Trianon. Why, they asked themselves, should this wealth continue to drain out of their country into Austria? Why should their wealthy people travel to Vienna to spend their money? Were not the streets of Prague, or the streets of Belgrade, or the streets of Bucharest, better than all the streets of Vienna? Why should not some means be found of diverting the flow of wealth into their own coffers?

And so, whether the framers of these treaties anticipated it or not, one of the first acts of the succession states was to run up a succession of economic barriers between themselves and Austria. The effect was immediate. The terrible situation in Austria, like a reservoir cut off from its feeding streams, began to attract attention very soon after the Armistice, and it was not long before prominent economists in various countries were trying to arouse public thought to what rapidly came to be called "the Austrian danger."

"If Austria goes down," they insisted, "she will not go down alone."

Men like Sir George Paish, the British economist, declared roundly that the saving of Vienna alone would be worth untold treasure to the rest of the world. Austria was recognized as an essential part in the financial scheme of Europe, and many authorities went so far as to say that a loan to Austria, sufficient to place her on her feet, would be worth while many times over to the countries subscribing for it, even if it were never repaid. The trading activity resulting from such a loan, the throwing open of the doors of the great clearing houses in Vienna, the rehabilitation of the Viennese banking system, would, they insisted, more than repay the nations for the actual money expended.

The world, however, was not in a mood to listen. Then as now, moreover, there was far too great a tendency to view matters from a national standpoint, and for each nation to seek to use Austria's need as a lever to gain its own ends. In the great struggle for territorial and political adjustments, for strategic frontiers and military safeguards, the economic demand was again and again thrust aside, and the fact that the water was steadily rising behind the dam disregarded.

Ultimately, of course, after long months, even years, of debate, the loan was forthcoming; and through the efforts of the League of Nations, Austria began to be rehabilitated. It is, however, perfectly evident that money could never have brought about Austrian rehabilitation, and can never bring about the full rehabilitation of Hungary or any of the other succession states, unless all economic barriers between the countries are swept away. It is because the international loan to Austria was accompanied and quickly followed by understandings with her neighbors, that the rehabilitation work has gone so well. And if a similar beneficent work is to be carried out in Hungary, under the new League of Nations scheme for that country, it will, of course, have to be accompanied by a similar good understanding.

Take the case of the Carpathian Slovaks. The experience of these people is the experience, in a greater or lesser degree, of the peoples in all the succession states. The Slovaks are an agricultural people. The vast majority of them are quite primitive and simple, tilling a rather hungry mountain land as their fathers have tilled it for centuries. But while their harvest from the field is always diligently sought, what they depend most upon for sustenance are the great forests which clothe their hills and mountain sides.

Between these hills and mountains there flow down to the great river in the plain, the Danube, a number of tributaries set in parallel lines across the land, and for centuries it has been the custom of the Slovak peasant to use these streams as carriers of lumber. Two or three families would join together and, having felled some trees, would roll them down the steep sides of the hill to their particular river, and there, after poling them to a place where the waters broadened out, they would fashion them into rafts. When this was done, it was their way, with a small stock of provisions, to drift down with the current into the Danube, and then down the Danube as far south as they could, for the farther south they went through the treeless plains of Hungary, the better price they got for their lumber, and the greater the quantity of wheat they could take back with them to their native land.

All through the great war, this work continued in one way or another, but after the war came the treaty of Trianon. Overnight, a great "dam" was thrown across the mouths of these rivers. And when the Slovak lumberman came down with his raft, he found there was no passageway into the Danube because an economic barrier had been built up by some people in Paris, and to pass into the Danube would be to pass into the territory of a foreign country. Desperately he sold his lumber for almost nothing to dealers who crowded to take advantage of the situation, and returned home to his family, to straitened fare and bitter times. For his river, his beloved Waaz, or Neutra, or Gran, refused to flow in any other way but the way it had always done, simply because a certain number of men round a table in a distant country had thrown a bar across it at a certain point. Meanwhile, the Magyar peasant was deprived of his lumber, and had to find what market he could for his grain.

It was the same with the Austrian banker, the Hungarian grain dealer, the Jugo-Slavian peasant with his herds of swine. In all directions, in fact, in Central Europe, every effort at rehabilitation has brought men round full circle to the point where to succeed they have had to make the frontiers imposed by the peace treaties of no effect as far as trade was concerned. And so today, as these economic barriers are being steadily thrown into the discard, men are beginning to understand better what Talleyrand understood so well more than a century ago. In other words, Austria-Hungary, having ceased to exist, is in process of being invented.

And as it is with the old Austro-Hungarian empire, so it is with the rest of Europe. The removal of economic barriers is a process which almost more than any other will tend to the restoration of that understanding and good will among the nations which must form the basis of all future progress.

Many of the wars of past centuries, wars which drenched the Continent in blood, had their origin through economic wars, wars against imposts, tolls, tariffs, and tributes. Many of these impositions were legalized forms of robbery which may have enriched princes and potentates, but which pressed heavily on the people.

The removal of age-long causes of irritation such as these is a hopeful sign.

Mr. Ford's Page

ONE of the most hopeful facts of the time is the vastly increased interest of the people in what are commonly called economic matters. When their store of knowledge begins to equal their degree of interest, the material world is going to be absolutely safe for the plain man. The reason it is so easy to deceive people today with regard to these matters is that they are not in possession of enough facts to challenge and test the things that are told them.

They are deceived twice: once by professional financiers who tell them that we now have the best possible system, and once by professional reformers who declare that we all are slaves of designing men who with infinite malice and cunning contrived the shackles that bind us. Presently the people will learn that there are just two classes of teachers which they can afford to disregard, and these are the professional financiers and the professional reformers; neither class knows the a b c of economic principle; both are actuated by self-interest and class prejudice.

> *THE last stamping ground of the money power is in Europe. Its failure to fasten itself upon the American people has driven it again overseas. The chief danger to our people in this is that Europe may assume that it is the American people who are doing what inevitably the Money Power will do to helpless nations. The need of Europe is not money, but developed industry. This would free her from control by the Money Power. Industry has emancipated the United States. The embassy of liberty to Europe should not consist of financiers and politicians, but industrial leaders who can actually start to Make Needful Things, and introduce the blessing of steady work, sure earnings, and plentiful exchange among people who need these more than anything else. Governments may need loans, but nations need industry.*

But it is only a matter of time before the people get the facts, now that they see economics to be more than a college study, to be really their own daily business. Economics was once considered as a book subject, but now it is known to be a bread-and-butter subject. Economics is really a compound of knowledge and honest purpose in the task of feeding, clothing and housing the world, a task which is perfectly easy of accomplishment once this knowledge and honest purpose are brought to it.

In this country the people have just instinctively found their way into the path of economic freedom and success. Something in the genius of our people just naturally prevented them being made slaves. There are some races that can be subjugated, and others that cannot; ours cannot.

In this country the money power has never wholly controlled the people, and for a quarter of a century such control as it once possessed over the economic fortunes of our people has been steadily diminishing. This is one economic fact which our people should begin to realize.

The period and ratio of the decrease of the money power in this country corresponds exactly to the rise of Industry in this country.

There is still a certain class who rail at Industry; it was Industry that secured to this nation its economic freedom; it was Industry that made it impossible for any Money Power to gain control of the destiny of the American people.

Why? Because a people that has learned to produce the *things* that are needful for life can do business among themselves, and make their own money if necessary. America, for one thing, is the only country in the world whose working classes can buy what they make. England perishes without an outside market; her workingmen cannot buy what they make. Germany went to war for outside markets; the German manufacturer never dreams of the German workingman becoming a customer for what he makes. In this country, our people have something of everything that they make. For example, there are more motor cars owned by the workmen of one industry in one city of the United States, than can be found in all Germany or England.

It is perfectly clear that with capable people like ours, no money power has any chance at all. Industry has its own money, earned by service, rededicated to service, and in plentiful amount as long as service is given. When service ceases, the money simply gravitates back to the people to whom it belongs.

One has only to read the foreign news and know a thing or two of what transpires behind the scenes to understand that a Money Power is still in existence, but its only field of operation now is the backward countries of Europe, where Money still stands for wealth, and where Industry is still frowned upon as beneath the dignity of high-born folk. Many plans of international bankers have been laid these recent months to enslave by money whole nations in Europe. And they will succeed as long as the people lack industrial leadership, as long as such industry as there is bows the knee to speculative bankers. Industry will save Europe, not political loans which are dissipated in the affairs of bankrupt governments. This is the only field left to the Money Power.

Anyone who for a moment would compare conditions in Europe with conditions here, and argue that as Europe is controlled by money, so is the United States, would simply be talking wild. And this is a point which our people should have clearly in their mind. They should challenge the declaration of men (mostly aliens) who, coming from Europe, assume that the same conditions obtain here. Most of our Communists and subversive Socialists are newly arrived Europeans who have been so busy talking that they have not discovered that the United States really and fundamentally differs from the rest of the nations. It differs in this totally: it is not controlled by any money power.

We must learn to drive through all our thinking the profound distinction between finance and business. This is the country of Big Business, without a doubt. But as shown in a previous page, Big Business controls nothing, it is entirely at the mercy of public demand.

Still, the very bigness of Industry fills some minds with misgiving. It is amazing how few seem able to distinguish between industry and finance. In the violent period of the union labor movement, the *employer* was always referred to as the *capitalist.* The whole trouble was that the employer was not a capitalist, but was under the thumb of capitalists. In those years most businesses were conducted on borrowed capital, which gave the capitalist a super-control of the industry. The poor manufacturer, standing between hostile labor and rapacious capital, had a hard time getting anything done. Pressed from above for interest and dividends, pressed from beneath to grant more money for less work, he was in a strait betwixt two. And all the time he had to bear the abuse that was being heaped upon the capitalist.

But a change has come. Business has gradually been making its declaration of independence. It does not minimize the service which the world of finance could render, but it has declared itself free from domination by that world. When finance exists to serve industry, which is its proper function, then finance is recognized as part of the service instrument of humanity. But when finance assumes that the whole world works to produce profits for finance, and for finance only, then that assumption is not only denied but destroyed.

Business has freed itself from domineering finance by keeping within itself its earnings. Business that exists to feed profits to people who are not engaged, and never will be engaged in it, stands on a false basis. This is being so well understood that it has become a part of the creed of commerce that the service of business is wholly to the public and that the profits of business are due, first, to the business itself as a serviceable instrument of humanity, and then to the people whose labor and contributions of energy make the business a going concern.

But neither business nor finance has power to compel the public to buy here or buy there. The record of financiers in business affairs is full of disaster. If finance were all that the lurid alarmists say that it is, America would be filled with a race of ragged peasants today. But Industry has prevented that; Man Making Things, Man Thinking, Man the Believer in Real Wealth rather than in Sham Wealth—that is to say, Man in Possession of his Original Deed of Ownership of the Earth is not likely to become the bond-servant of non-creative money-changing system.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Prohibition Wins Olympics

APOSTLES of "personal liberty" may regard it as merely a coincidence, but the fact remains that the honors of the Olympic games were carried off by athletes from prohibition countries.

Regard it from whatever angle one may, it is now a matter of history that Prohibition America and Prohibition Finland won the chief prizes in the Olympic contests at Paris. The figures of national standings have been given as follows: America, 255; Finland, 166; Great Britain, 85½; France, 26½.

The figures may mean nothing at all, but there they are.

Free Speech

LET us preserve free speech at all costs. Prejudice, ignorance, malice, never so surely evaporate as when expressed. When men growl and curse, these moods are dissipated into thin air. The most certain way to prepare for explosions is to suppress free speech. People who hear their religion, politics or principles denounced should listen with wise satisfaction, knowing that the very act of utterance is preventive of more serious antagonism. Free speech, coupled with an understanding of its value as a safety valve, will prove a solvent of many strained situations.

Too Much Machinery

THE common fault of many schemes for monetary reform is that their adoption involves complicated and unnecessary machinery for administration. Reform in the monetary system does not require any great alteration of present laws. The strength of the currency of the United States lies entirely in the faith and credit of the nation, based on its ability to redeem every form of issue in the metal designated as the standard. The weakness of the system lies in the fact that the chosen metal is not stable in value, but fluctuates. This variation in gold values is expressed in the changing prices of commodities, labor and land. With every change in the purchasing power of gold, one class or another of the people is injured.

This fact is recognized by financiers. Take an individual whose earning power is $3,000 a year. Suppose he could capitalize that earning power at $50,000, the amount which would return him the same income at six per cent. As a wage-earner, his income would not only secure less of a living for him if the dollar decreased in purchasing power, but even his wages would be proportionately reduced as expressed in dollars. As a capitalist, however, he would receive not only the benefit of reduced prices, but the increase represented in the increased purchasing power of his income.

This inequity is recognized by every economist of reputation, and many have made efforts to stabilize the dollar, so that it will represent at all times an average quantity of commodities. Such economists, if consistent, must agree that the gold standard is not equitable.

To return to the machinery required for monetary reform. Granting the claim that the evils charged to the Federal Reserve System are due to bad management and not to the plan itself, there would still lie against it the fact that it is a coarse, unnecessary machine, whose functions, even when properly managed, *could be more economically performed by the Treasury Department.*

The basic evil of the Federal Reserve System is the delegated authority to issue currency and the permission to make its volume rest upon commercial paper, denying to government obligations the currency privilege. Thus, while retaining the interest on commercial paper deposited, the system is permitted to extend the government credit in equal volume to member banks, to use which credit every political unit must pay tribute in the shape of interest. Even government itself pays from four to five and one-half per cent on its own credit, while, by monetizing its own obligations it might eliminate all interest, saving each year more than its running expenses.

This is a complicated and costly machinery, just installed within recent years. And machinery which increases the cost and reduces the measure of service can scarcely be called an improvement.

Is It Wasted Effort?

"THROUGH the sudden clearing of the misty atmosphere which left the whole ridge of the final peak of Everest unveiled, there were seen two tiny black spots silhouetted on the snow, steadily climbing upward toward the crest. Then the whole fascinating vision vanished, once more enveloped in cloud."

This was the last that was seen of A. C. Irvine and G. L. Mallory, two members of the Mount Everest Expedition, which has once more been abandoned.

Whether expeditions such as this are worth men's lives is a debatable point. All such enterprises must be judged by the benefit they are calculated to confer on the human race; and it is hard to see what good could come of reaching the summit of the highest mountain in the world, except to deter others from attempting a similar feat.

The spirit which impels men to make such efforts recalls Longfellow's lines on the ambitious youth who perished amid Alpine snows, and awakes one to the futility of wasted forces. Those who died may be called "martyrs to science," but is such martyrdom justifiable? The only test is the good which may follow.

Men have perished in trying to reach the poles; they have died in their endeavors to open up new pathways in the world of commerce; they have laid down their lives in blazing fresh trails for the advance of civilization, and by new resources uncovered, countries found, and colonies planted have earned the gratitude of posterity; but the energy, treasure and time expended in reaching the "roof of the world" appears strangely futile.

But, it is now said that every one of the surviving climbers of Everest has "shot his bolt"; there will be no question of a resumption of the struggle to conquer the mountain, for serious physical disabilities have supervened, and medical veto has been placed on further attempts as far as the present party is concerned.

The king of the Himalayas will sleep beneath his mantle of snow! But how soon will it be before the world will again be offering him the tribute of valuable human lives?

So This Is London!

INTERESTING reading, indeed, is the annual report of the Metropolitan Police of London, England, especially when compared with police conditions in American cities. The largest city in the world has a crime record that makes more modern and less impoverished cities appear as utterly abandoned to evil. Two items particularly attract attention—the number of "alleged murders" in 1923 was twenty-seven, as against twenty-eight the year before. Compared with the murder statistics of large American cities, this is mere amateurism. Most large American cities can beat that number any month. "No case of unsolved murder occurred during the year," is another brief line that shouts a comparison with our long record of unsolved and unpunished crimes.

So this is London! Surely its bigness is somewhere reflected in its crime record. Try automobile theft. "Thefts of motor cars and motorcycles were less numerous; 327 were reported stolen in 1922, and 251 in 1923, a decrease of 76. Of these 147 were recovered."

The number of motor cars stolen in Detroit alone in 1923 reached the high total of 4,428. But the percentage of recoveries was also very high, the total being 3,654.

More Efficiency, Please!

THE wave of specialization which has made for efficiency in the walks of commerce and industry has engulfed statecraft, the result being chaos.

The cobbler of a half-century ago graduated from his apprenticeship when he proved himself able to measure a pair of feet and make top boots or dainty kid slippers to fit. His successor of today caps a toe, pulls the lever of a stitching machine, or works the stamp which shapes soles.

The first automobile was constructed by versatile mechanics who commenced by hand-forging the parts, and ended their labors when the machine was running. Now a great, pulsating, roaring, grinding machine forges, lathes and assembles, while here and there about the plant stand humans, each giving a pull or a cuff to a certain part, and very few knowing anything about the workings of a car, aside from the particular tasks which have been assigned to them.

All of this spells efficiency, smooth, jarless coordination of effort.

Working in separate sheds, under different foremen, men contribute toward the building of a certain thing, each workman a master in his line.

One-idea men, to be sure, but one idea is enough for one task.

But when one-idea minds, even clean, sincere ones, mass in a legislative hall, instead of working toward a common end, they pull and haul in opposite directions.

Any radical innovation in government, good or bad, shunts into prominence a squad of specialists.

The successful suffrage movement came as a tidal wave, and on its crest rode Senatorial and Congressional candidates whose sole qualification was that they were ardent suffragists.

Prohibition propelled into office dozens of legislators of mediocre ability who garnered the votes because they were a little drier than their opponents—or pretended to be.

After-the-war hysteria, subtly abetted by organized propagandists, delivered another squad of statesmen, many of whom had no recommendation other than the fact that they were good trench fighters.

It is this pulling, hauling, shoving, yammering conglomerate which instructs the State Department in the intricacies of foreign affairs.

It is this potpourri of varied mentalities which selects guns for the army, and tells grizzled seadogs what sort of ship is most effective.

It is this hydra-headed composite which confidently draws plans for the edification of the Secretary of the Treasury.

And for all of this, the man in the street is to blame. The valid excuse of the legislator is that he was sent to Washington with but one message in his pack, and has spent his whole time endeavoring to deliver it.

Practically every man in Congress was sent there to sing the air of his province, and if the result is a discordant yowling guided by neither tone pipe nor metronome, the people, not the performers, are to blame.

The legislators were sent there to yell, and the most exacting of us must admit that they have done a good job of it.

All over the country there are counterparts of those grand figures who served the United States of America twenty years ago, and each of them served all of it. We may have here and there a hidden Douglas or an embryo Jefferson. If so, the breadth of their vision and the depth of their understanding is keeping them out of politics, for no statesman, with a proper sense of proportion, would stoop to exalt little things and smother big things at the behest of voters who have forgotten that the glorious conception which resulted in the birth of this country, took no account of cliques, classes, sects or organizations, but only visualized an America whose statesmen could see clear across the country, and work for the upbuilding of its every section and interest.

Here Is the Answer

A RENEWAL of the talk about throwing the election of President into Congress indicates a desire somewhere that such a situation occur. The idea is being planted in the public mind from every angle. It is an obsession with a certain class of writers. Were such a futility to occur in this country, it would seriously shake the world's confidence in our theory of self-government. But it need not occur. It can easily be prevented by the simple act of voting. When three-fourths of the voting population, or even more than half of them, actually vote, there will be a definite decision rendered as to whom the people desire to be their President. The answer to all this strange speculation of an election that will not elect, is—Vote.

"Bootlegger" Dentist a Menace to Public Health

Exorbitant Fees Are Collected for Worthless Operations

By E. L. M'COLGIN

"WHAT do I care whether a dentist is licensed? When I need a dentist I just walk down the street and enter the first office that displays a sign."

The secretary of a state administrative board was summarily dismissing the request that funds be made available for searching out unlicensed dentists and those operating "parlors" with unlicensed operators. However, one's health and length of life depend much more on who is your dentist than who is your political favorite.

Dr. Charles H. Mayo, the distinguished surgeon of Rochester, Minnesota, declared in 1913 that the "next great step in preventive medicine should come from the dental profession." Seventy-five per cent of the infections of the whole body have their origin above the collar, according to another authority. One cubic millimeter of saliva, sufficient to cover a pinhead, has been found to contain 385,000,000 bacteria. The loose tissues of the mouth and throat are ideal breeding grounds for disease.

America has the best dentists in the world, but we don't have enough of them. The public suffers from its ignorance and indifference to the value of preventive dentistry and the absolute need of having only high-grade ethical dentists. The cost can be reduced to almost nothing by merely going to the dentist before there is a history of pain. Incidentally it really costs much less to have the best dentist at the very outset.

Persons who will go to the Mayo clinic regardless of cost sometimes display the need for serious general surgery through having patronized a quack dentist at some earlier period in their lives.

It is just beginning to be appreciated that only the best in surgery is safe. Even the removal of tonsils is fraught with risk and people are willing to pay $50 to $150 for it.

While such a charge is seldom or never made, it is really worth $50 to have the nerve of a single tooth removed and the canals filled so that there will be no possibility of infection.

Dental bootleggers undermine the health of more people than do the gentry who purvey dubious liquors. They have the same reckless, callous viewpoint:

"For God's sake, don't let him die in the office. Get him out on the street and let him die there if that is going to happen." Deaths in the dentist's office have a bad effect on the public.

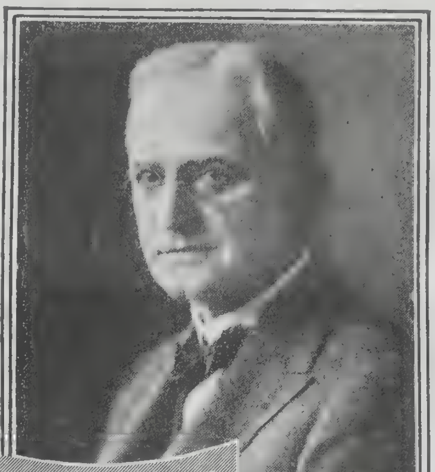
"We are after the money. Don't worry about those who may become dissatisfied and not return. Next Sunday's newspaper advertising will fill the office with new patients."

This is the way the bootlegger dentist exhorts his staff. His operators are often young fellows just out of dental college. Their incomes and the profits of the proprietor depend upon rushing the patients through the chairs. The operators usually work on commission or piece-work and can make from $100 to $150 a week.

Young dental graduates without capital often have to work in such offices to get money with which to practice for themselves. The tragedy of it is that they often succumb to the easy money and forego the development of an ethical practice of their own. They justify their lapse on the ground that the public doesn't want to pay for good dentistry and thus is richly deserving of being misused. The advertised plea of these quacks and the excuse of many governors, attorney-generals and district attorneys who do not enforce the law is that the masses of the "peepul" should have dentistry brought within their reach though it be somewhat less refined. Let us see what happens to these clients of the dental quack and the politicians:

The advertised low prices are just a lure to get the ignorant and selfish into the "parlors." The proprietors charge all the traffic will bear and give uniformly fake service, regardless of the price.

The "solid" gold crown that is offered for five dollars costs but thirty-five cents. It is known as a "tin can" and has just enough gold in it to take a high polish when new. Such crowns are simply clamped upon the teeth without any fitting to either the gums or to articulate with the opposite teeth so that biting and chewing can be done fairly well. Prosperous looking callers are given a selling talk that enables a good stiff charge to be made regardless of the fact that the same worthless material and methods are employed. They are told that while it's true the cheap advertised work is done, it is only intended for those who cannot afford anything better. Thus it is nothing uncommon for twenty dollars to be collected for about $1.50 worth of time and material.



Above—GEORGE EASTMAN, founder of Rochester Dental Dispensary. Below—Infirmary at Rochester Dental Dispensary, showing dentists and hygienists at work.

The grinding of teeth by unethical dentists is usually done with burrs that have just been used in the rottenest sort of cavities in another person's teeth.

Cocaine is frequently injected under the filthiest and most dangerous conditions. The needle is often thrust into the gum without having been cleaned since its previous use. Instead of using a new package of cocaine, money is saved by using bulk containers of it. The dirty needles are thrust into it and the bacteria from many mouths mixed together into a poisonous mess that is the cause of swollen jaws and sometimes serious or fatal infection of the luckless victims.

All the quacks now advertise the use of the X-Ray and some of them offer free examination with it. And well they may, because it assists the quack to sell the patient anything he can afford to have done.

One of the best known dental surgeons in the United States defines the place of the X-Ray in dental practice: It is just a valuable adjunct to a competent practitioner making a diagnosis.

A few typical and often pitiful experiences of the victims of incompetent dentists may be mentioned.

A young matron came to a dental consultant's office upon the advice of her physician who was baffled by her general poor health. Her knees were swollen to double size and the lymph glands of her throat were badly swollen. Her physician had frankly told her he feared tuberculosis and thought she would not live long.

This woman had spent $275 for crowning with an advertising dentist who had glibly assured her that this would end her troubles with her teeth. With tears in her eyes, the patient said to the consultant: "Doctor, if you think it is these teeth, take them out; I can't die, I have three children."

BEFORE
October, 1922

AFTER
December, 1923

The teeth were extracted and proper treatment given. After seven or eight days the swellings began to subside. Within a year careful attention resulted in the woman's health becoming about normal. In a letter reporting progress she said: "It must be wonderful for you to take people and make them well."

A wealthy man with seven nerveless teeth crowned by one of these practitioners became afflicted with a stiff leg. He could merely drag it around and was alarmed. He went to good physicians and made a long stay in Florida in the hope that outdoor life would help. Finally his physicians sent him to a dental surgeon. Three of these teeth were drawn and germ cultures made from them were injected into a rabbit. Within three days Brer Rabbit was dragging his hind legs as stiff and unresponding as those of the human patient. After all the offending teeth had been drawn and proper treatment given, it was not long before the man was playing golf.

Another man spent $125 for "gold" crowns, and after suffering for three years he went to a competent dentist. His finger joints were badly swollen and he was in an altogether unfit condition. Within a year, he, too, was restored to good health.

The advertising and practice of incompetent dentists do not deprive the legitimate practitioners of patients or profits. Ultimately every one of the victims has to seek a good dentist and have the work redone. Working girls, economical wives, and poor or thoughtless people generally, are mercilessly exploited.

The history of a type of these charlatans will disclose their average personality and also the way politicians evade their duty.

Dr. ——— is an advertising dentist that afflicts a certain large city. He loudly proclaims that he is the graduate of a certain dental college of national reputation. However, his alma mater recalls him with disfavor. During his undergraduate days he was notorious for his misconduct and for his indifference to his studies. Upon his final examination he only obtained "C," the lowest passing grade, because a charitable student permitted him to copy from his paper.

The state dental board discovered this man had unlicensed operators in his office and ordered his license revoked. He obtained an ordinary injunction to stay the cancellation of his license pending the trial of his appeal from the

Sapiro Rust in the Northwestern Hay Crop

Thousands of Tons Lie Rotting in Fields Through Not Finding Buyers

By ROBERT MORGAN

IF A MAN will take a map of Idaho. Washington and Oregon, and. with a supply of red and white and blue pins set down a red pin wherever there has been an outbreak of Communism, Radicalism, or I. W. W.-ism; stick in a white pin wherever the Jewish farm-exploitation organization has founded one of its so-called California plan co-operative marketing associations; and put in a blue pin wherever one or more such associations have failed—he will find that he has a set of three pins at each point.

The writer knows, because, in company with an American who is devoting his life to fighting the curse of Bolshevism which has spread and is spreading like dry rot through Washington and Idaho, and less rapidly through Oregon, he performed this very experiment The result is the flat statement of fact given above. It is not a guess, it is not theory, it is not supposition; it is a very real condition, and a dangerous one, in agriculture and in all industry throughout these states.

Wherever the Jew appears, or his Gentile henchmen, promoting associations for the "benefit" of the American farmer in these states, under whatsoever name these associations may be organized, there appear as their lieutenants, the Radicals, the agents of the Industrial Workers of the World, even open adherents of Communism and Bolshevism, as the strong arm men to "put the work on" hesitant farmers. Wherever these associations fail, as they all fail, sooner or later, wherever the American farmers are left to bear the burden of disaster and debt put upon them by these promoters and organizers, there the Radicals, the Communists, and the other off-color workers in agriculture and industry of other kinds are revealed. They are never injured; they always have money; they have no permanent interest in either farms or industries, and they are the first to disappear as mysteriously as they appeared.

The Scribe, a Jewish weekly published in Portland, Oregon, complains that these articles insist too much on Aaron Sapiro being a Jew. "His work is totally unrelated to his Jewish origin except in the inherited love for humanity incidental to that type of ancestry," says *The Scribe*.

It may be so. It may be only a coincidence that the line of Agricultural Control in this country runs from Otto Kahn and Bernard M. Baruch down through Aaron Sapiro and lesser Jews.

But—here is an incident which may throw light on that:

Because Aaron Sapiro, when he organized the Colorado potato-growers, thought Erskine R. Myer, a prominent attorney of Denver, spelled his name M-e-y-e-r and was a Jew, the enterprising young promoter of co-operating marketing associations employed Mr. Myer as attorney for the Colorado Potato Growers' Exchange.

When Mr. Sapiro came to Denver, he asked Mr. Myer, point-blank, "Are you a Jew?"

When the negative reply came back, Mr. Sapiro immediately brought in Morton David, a Jewish attorney, to take Mr. Myer's place. But the directors of the Exchange, three of them, refused to let Mr. Sapiro "fire" Mr. Myer, so Mr. David is still out of the potato job, but under the wing of the Jewish organization.

Then Mr. Myer and three directors took charge of the situation, wrested control of the $2,000,000 potato crop from Mr. Sapiro and his sales agents, Weyl & Zuckerman, collected payment for the crop, and paid the 2,000 farmers who produced the potatoes.

This was an expensive mistake for Mr. Sapiro.

Back of all this lies, of course, something vastly larger, and a great deal more important than the simple organizing of a lot of American farmers in co-operative marketing associations. It has not appeared in California, where the Jew-organized farm associations are most numerous, to the extent that it has appeared in other states, because in California the criminal syndicalism law stands guard over the farmer and over all other industries.

But behind the scenes in the great and undeveloped Northwest, potentially as productive an empire as the Mississippi Valley, and far richer in natural resources and hydroelectric power than all the other Pacific Slope states combined, those Americans who are fighting to keep this principality out of the hands of the same people that ruined Russia firmly believe there lies a well-organized plot to turn over the resources and the industries of these three states to the international race.

There has been a great migration of Jews to Seattle, Spokane, Portland, Astoria, and the cities of Idaho, starting in 1920-21, the date at which began the efforts of the Jewish ring to dominate and exploit the farmers of these three states. *Without exception, the newspapers in the larger cities of Washington, Oregon and Idaho will not publish a line about the failures of the co-operative marketing associations formed by these Jews.* When the Northwest Wheat Growers Associated failed, carrying with it millions of dollars of the farmers' losses, *the large newspapers, and ninety-nine per cent of the small ones, merely reported that the various associations in this organization "had suspended operations."* Not a word was said of the Jews who had brought about the ruin, nor yet of the Gentile "fronts" who had taken the glory for the association when it was put over on the farmers. The story of this loot of the wheat crop of three states is going to be told, but first there is an outstanding example of the combination of Jew and radicalism, a clear exposition of the hand-in-hand workings of the notorious Sapiro Plan of marketing and the principles of Bolshevism, which must be told.

In the state of Washington, one of the heavy crops is hay. As it comes from the fields it is worth an average of $37.000.000 a year to the farmers who produce it. Up to 1923, the farmers got this thirty-seven million dollars for their hay. They sold it to American dealers in hay and were paid for it when they delivered it, on the American principle of paying for wheat one buys. But in 1923, the vultures descended on that $37,000,000 crop, This article will show that those hay farmers received next to nothing for their hay, were prevented from selling their hay elsewhere, and today have thousands of tons of that hay rotting on the fields.

The hay crop of the entire state of Washington, and of such parts of Idaho and Oregon as produce hay, was invaded by these promoters of the welfare of the farmer, under the name of the Northwest Hay Growers Association, with headquarters at Yakima, Washington, where L. A. Hunt, apparently a Gentile, perfected the organization, and became and still is its nominal head. Prior to this "successful" job of organization, Hunt, in 1920, formed and headed a co-operative hay-marketing association at Hermiston, Oregon, which went to smash, carrying with it the money and the hay of the farmers who had joined it. Prior to this, Hunt had been involved in similar projects, the history of which it is not at this time necessary to trace.

The Northwest Hay Growers' Association started out to control all the hay produced in the states involved, particularly in Washington, where the hay crop is heavier than in the other states. It promised its members that it would control at least seventy-five per cent of the crop, but it never did attain control of more than thirty-five per cent, and probably not more than thirty per cent. It has never rendered a report, either on its operations or on its financial condition, as required by the state law, and the information contained in this article is obtained from reports given by the association to its members, supposedly secret, and on data obtained by independent hay-growers seeking to save their friends from the ruin with which this association finally overwhelmed them. Such information is more accurate than any of the official reports ever put out by any of the California Plan associations with which the writer has yet come in contact.

For the past year the local associations, called "districts," in this hay organization have been in deep trouble. It is impossible to tell the story of all of them, but we may consider as a fair example the districts of Yakima, headquarters of the whole northwest association; Walla Walla, heart of the hay-growing section of Washington, and to a lesser degree, Hermiston, over in Oregon. At Hermiston, the ill-fated Hunt association was "reorganized," as is usual with these organizations when they fail. The prosperity of one of the Walla Walla officers is due to the fact that he does not sell his hay through the association, but to independent dealers.

Now then, this Northwest Hay Growers' Association, when it started operations, borrowed $180,000 from the banks. If you have read the previous articles in this series, you know the banks from which this money was borrowed, and where the interest of about $13,000 a year went. This money was supposed to be needed to pay "advances" to the farmers on their hay crops, and to care for expenses of the association, such as salaries, overhead, marketing costs and so on. It cared for everything but the advances, and the farmer has found by sad experience that his "advances" have been converted to "arrears" while he is still paying the interest.

When the farmers had swallowed this fairy tale of debt, the management of the association slipped out and bought six carloads of bale ties, at a cost of approximately $5,000 a car, or $30,000, unless there were some "discounts" to the buyer, of which the farmer did not hear. This started off the Northwest Hay Growers' Association with a nice little debt of $210.000. But this is merely the regular method followed by the promoters of the Sapiro Plan (California plan) of co-operative marketing associations to plunge their members into *debt which these members have got to pay or lose their farms.*

Now, thus well started, the association management succeeded through its agents, several of whom are known to have been I. W. W. organizers, and others equally well known to have been members of other radical organizations in agriculture and out of it, in signing up about thirty-five per cent of the growers of hay in the Walla Walla district, representing some 10,000 tons of the 30,000-ton annual production there. I want to be very specific about this Walla Walla district, because it is the district in the Northwest Hay Growers' Association which is most often held up as ideal in operation and results by the propagandists for the Sapiro Plan. For every member that they enrolled—the exact number is not given out by the association—these "organizers" and "agents" took ten dollars, and took it out of the pocket of the farmer, not out of the $180,000 borrowed by the association.

The association's next step was to fix the price of baled hay at $15.80 a ton. The current market price was $13 a ton.

In between, the association sold the farmer his bale ties at about five per cent more than he would have had to pay for them on the open market.

And let us see, five per cent of $30,000, which the bale ties cost, is $1,500, isn't it? That is to say, the farmers growing 10,000 tons of hay, paid virtually the value of 100 tons, or one per cent of their crop, in excess costs for their bale ties.

And not one farmer knows what became of that $1,500.

The writer knows where it went; the independent hay-growers of Walla Walla know where it went, and they are all ready to tell when the state demands a financial accounting from this organization, so I am not going to tell it now.

Of the 10,000 tons of hay signed up by the association, about 2,800 tons, not more than 3,000 at the outside, were sold, supposedly at the fixed price of $15.80. f. o. b. cars, or $2.80 more than any one else could get for his hay. There having been no financial statements made by the association, and the farmers not having been paid for their hay, there is no means of knowing at what price the management of the association sold it. Some independent growers and many of the association members believe that the hay was sold for *less than $13 a ton which the independents got.* There are at this writing approximately 7,000 tons of hay on the hands of the association, out of the 1923 crop, with the 1924 crop coming on, and no prospects of sale. The 1923 crop standing in the fields has deteriorated at least thirty per cent, and that is the farmer's loss, not the association's; don't ever forget that.

Now then, the Reds and Radicals and Communists and I. W. W. agents who went out in gangs of three to eight and hammered the weak-kneed, radical, or dissatisfied hay-growers into joining this association, promised the members that their hay would be marketed at a total cost of not more than seventy-five cents a ton. The average cost of marketing hay to the independents is $1 a ton. But, when the membership was signed up, *on contracts which bind no one except the farmer who signs, the announcement was made that the cost of marketing would be two dollars a ton.* Those who read the writer's exposé of the loot of the California Prune and Apricot Growers' Association will remember that that association promised a marketing cost of five per cent

(*Concluded on page 14*)

More than 7,000 tons of baled alfalfa hay, sold by the hay-growers to the co-operative marketing association, has been left to rot in the fields, near Walla Walla, Wash., when it could have been sold for $13 a ton, or $91,000. The management of the co-operative association refused to sell this hay at less than $15.80 per ton, the "fixed price."

Was Tilden or Hayes the People's Choice?

In 1876 the Presidential Election Again Resulted in a Contest

By J. V. NASH

IT IS a rather noteworthy fact that during the one hundred and thirty-five years since the election of our first President, George Washington, in only two instances (if we except the Jefferson-Burr controversy, which occurred before the method of presidential elections was changed by constitutional amendment) has the will of the people as expressed at the polls proved insufficiently clear to give a good title to the possession of the White House for the ensuing four years.

The first of these contests over a presidential election was that which arose in 1824, when none of the four candidates in the field—Jackson, Adams, Crawford and Clay—received a majority of the electoral votes. As related in a recent article published in THE DEARBORN INDEPENDENT, the election of that year was thrown into the House of Representatives which, under the Twelfth Amendment to the Constitution, adopted in 1804, is in such cases empowered to select the President from among the three candidates who receive the highest number of votes in the regular November election.

In this instance, although Andrew Jackson had been given a plurality of votes, both popular and electoral, the House exercised its constitutional privileges by electing, not "Old Hickory," but John Quincy Adams. But the friends of Jackson maintained that inasmuch as their leader had won more votes than any other candidate when the people went to the polls, he was really the people's choice and was "morally entitled" to the presidency. This view seems to have appealed to the people, for in the next election Adams was retired from office and Jackson was swept in by an overwhelming tide of public sentiment.

For the next fifty-two years, through the most crucial era in our history—including, as it did, the long period of controversy leading up to the Civil War, the war years, and the reconstruction era of a decade following—there was never any contest arising out of the presidential election. To be sure, the election of Lincoln in 1860 precipitated the Civil War, but there was not the slightest question, either in the North or in the South, that Lincoln was the duly elected President. It was the very fact that Lincoln, the head of a new political party born in the North, had so decisively won the election, that brought the long slumbering controversy between the two sections to its tragic crisis.

It was not until the year 1876 that the second inconclusive presidential election in our history occurred. This resulted in the long-drawn-out Tilden-Hayes contest, a political quarrel which stands unique in our annals and which, but for the forbearance of one of the losers and the good sense of the people of the country, might have plunged the nation into factional warfare, à la Mexico.

In 1876 President Grant's two terms were just drawing to a close. Conditions in the South were still somewhat unsettled. Some of the Southern states were still suffering from the evils of the "Carpet Bag" régime, and from one or two the Federal troops were not yet withdrawn.

The nominee of the Democratic party in this year was Samuel Jones Tilden, who was born at New Lebanon, New York, February 9, 1814, attended Yale and New York University, was graduated from the latter in 1837, and admitted to the bar. He had been a member of the New York legislature and achieved early prominence in Democratic national politics. He had upheld the Union during the war and enjoyed the confidence of President Lincoln.

After the war, Tilden was active in overthrowing the notorious Tweed Ring in New York City. In 1874 he was elected governor of New York state and made a notable record by his fight against graft. On the strength of this fine reputation, Governor Tilden was enthusiastically nominated at the Democratic Convention in 1876 for President of the United States.

The outstanding figure in the Republican party at this time was James G. Blaine, then at the very height of his career. In the Republican Convention at Cincinnati he was the leading candidate, and it was confidently expected that he would be the choice of the party. Colonel Robert G. Ingersoll, the greatest political orator of the day, had placed Blaine in nomination, in a speech of impassioned eloquence, in which he referred to the statesman from Maine as "the plumed knight." The speech temporarily swept the convention off its feet, but after the enthusiasm had cooled down and the balloting began, it become evident that Blaine could not be nominated.

Blaine, with all his forensic brilliance and personal magnetism, and his hosts of devoted admirers, had implacable private enemies in his own party. Chief among these was Roscoe Conkling, of New York, whose influence in that great state was far-reaching. Years before, when both were young men in Congress, Blaine had subjected Conkling to a severe verbal castigation on the floor of the House. Conkling had sat through this lashing unmoved, but he never forgot the humiliation—he would bide his time and wait. To this enmity, no doubt, is largely attributable the persistent ill luck that dogged Blaine's footsteps and deprived him again and again of the presidency—the goal of his ambition. Then, too, in 1876, there was the recent scandal of the "Mulligan letters," which, although Blaine had been exonerated of the railroad graft therein involved, had somewhat clouded his political reputation.

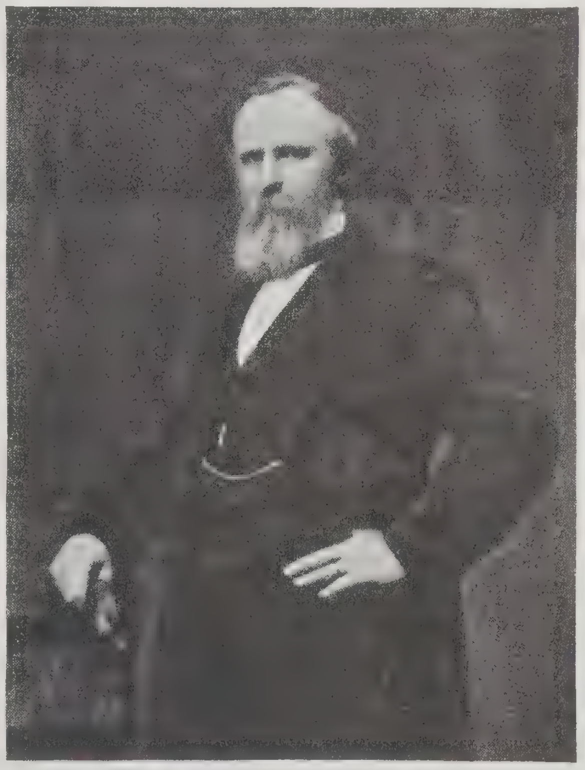
However all this may have affected the situation, the convention at Cincinnati became hopelessly deadlocked. The party of Blaine found itself confronting an obdurate stone wall. Finally, it became clear that the only solution would lie in agreement upon a "dark horse." This "dark horse" was found in the person of Rutherford B. Hayes, who was eventually given the nomination.

Mr. Hayes was born in Delaware, Ohio, October 4, 1822. He studied at Kenyon College and at Harvard, and was admitted to the Ohio bar in 1845. His first public office was that of city solicitor of Cincinnati. He was a Whig in politics, and when that party fizzled out he joined the newly formed Republican party. He served as an officer of volunteers in the Civil War, with a creditable record, and was mustered out as a brigadier-general. He was then elected to Congress as a Republican, and was among those advocating the impeachment of President Johnson. In 1867 he was elected governor of Ohio and was re-elected in 1869. He reduced the state debt very materially and put through much commendable legislation. He then determined to retire from public life, but in 1875 was persuaded to accept another nomination for governor, following which he was duly elected.

In the elections of November, 1876, the result showed 184 undisputed electoral votes for Tilden, as against 163 for Hayes. However, there was a conflict in four states, with a total of twenty-three votes; namely, South Carolina, 7; Florida, 4; Louisiana, 8; Oregon, 3. These states sent in conflicting returns. The controversy in the Southern states was involved with the post-war conditions; that in Oregon was a local affair unconnected, except indirectly, with the trouble in the South.

The crux of the dispute concerned the votes of these Southern states, particularly those of Louisiana. It was in connection with the contest in Louisiana that the most sensational charges and counter-charges were flung to and fro. These states were normally Democratic, and the election officials had returned certificates in favor of Tilden electors. But the "Carpet Bag" régime which still controlled the governorships in these states set up independent "returning boards" which arbitrarily threw out the Tilden electors and substituted Hayes electors, on the alleged ground of irregularity in the elections.

Feeling, of course, ran high throughout the country. The controversy could not be settled by carrying the election into the House of Representatives, in accordance with the constitutional provision which had been invoked in the election of 1824, for this was not a case where no candidate had a majority of the votes. There were only two candidates in the field; one must have received a majority of the electoral votes—the question was, which of the two could rightfully claim the majority?



Rutherford B. Hayes

As there seemed to be no other way of settling the matter, Congress, consisting of both the Senate and the House, took it in hand by passing an act creating a special electoral commission. The act was approved January 29, 1877. This body was to consist of five Senators, five Representatives, and five associate justices of the Supreme Court.

When the commission began its work, it became very evident that party lines would be tightly drawn, and this proved to be the case. At every point—and there were many of them—in the long investigation, the commission divided eight to seven. They voted as Republicans and Democrats, not as impartial inquirers. The electoral vote, as determined by the commission on the 8-7 basis, was: Hayes, 185; Tilden, 184. The partisanship of the commission was a matter of such common notoriety, however, that it would be more correct to say that the commission itself elected the President by a vote of 8 to 7.

Samuel J. Tilden

Justice Bradley, the fifth member of the Supreme Court group, was especially condemned by public opinion for his display of partisanship; it was his deciding vote that gave the Republicans a majority of one at every point of the inquiry. The criticism directed against him on this account was so severe that he later wrote and published a defense of his conduct.

Never before nor since in our history has the vote of one man determined a presidential election.

The "court" finished its hearings and turned in its report on March 2, only two days before the date set for the inauguration of the incoming President. March 4 fell on Sunday, and on Monday, March 5, 1877, Rutherford B. Hayes became President of the United States.

Many books and pamphlets have been written on the pros and cons of the Hayes-Tilden controversy. The noted Judge Jeremiah Black, a former Attorney-General and Secretary of State of the United States, who had defended President Andrew Johnson in the famous impeachment proceedings, and who was counsel for Mr. Tilden before the Electoral Commission, published in 1877 an article in the *North American Review*, entitled "The Great Fraud," which opened with these words: "Since the first formation of what Washington called 'our happy system of government,' no event not accompanied with violence or war has excited a feeling so intense as the act of 'counting in Hayes.'" The judge went into considerable detail regarding the points at issue, with special reference to the dispute in Louisiana, where many flagrant circumstances were alleged, and vigorously condemned the commission for its seeming partisanship.

The political lines on which questions of fact and principle had been decided by a commission whose duty it was supposed to be to ascertain the impartial truth and render a decision based on justice alone, made a very unpleasant impression in many quarters.

The hot-heads among the supporters of Tilden were for refusing to accept the findings of the commission and for putting their chief into the White House by force. Thanks, however, largely to the efforts of Tilden himself, they were persuaded to acquiesce in the decision. The Speaker of the House, Randall, of Pennsylvania, a strong Tilden man, was also of great assistance in urging a peaceful acceptance of the situation. But it is freely admitted by historians that at this critical juncture Tilden could, by the lifting of his hand, have secured by force the office to which, on the face of the returns in the regular election, a seeming majority of the people of the United States had elected him.

It reflects unbounded credit upon the patriotism and self-restraint of the losers in this unfortunate controversy that they preferred to surrender the highest office in the land, which they firmly believed they had fairly won, rather than for selfish advantage to plunge the country into bloodshed and possible anarchy. In many other countries such a sacrifice of individual advantage to the common good would have been unthinkable.

Hayes' administration, be it said to its credit, was in every way honorable and acceptable, regardless of the equity or inequity of the means by which it had come into power. Civil service laws were initiated, and Mr. Hayes, in spite of some opposition, restored to the people of those Southern states who were still suffering disabilities growing out of the war, the full control of their own affairs; the last remnants of the Federal troops were withdrawn.

Yet there are many today who still maintain that during the four-year term from 1876 to 1880 the rightful chief executive of the country was President Samuel J. Tilden. Others maintain with equal sincerity that the commission could not, under a strict construction of the Constitution, have rendered any other decision than it did.

As in the case of John Quincy Adams, Rutherford B. Hayes, notwithstanding his excellent administration, did not win popularity. In fact, before his four years were up, he had fallen into such disfavor among the leaders of his own party that the compliment of renomination was flatly denied him; and so, again like Adams, he stepped out of office, a one-term President.

Athelstan, the First King of All England

Laid Foundations of the British Empire

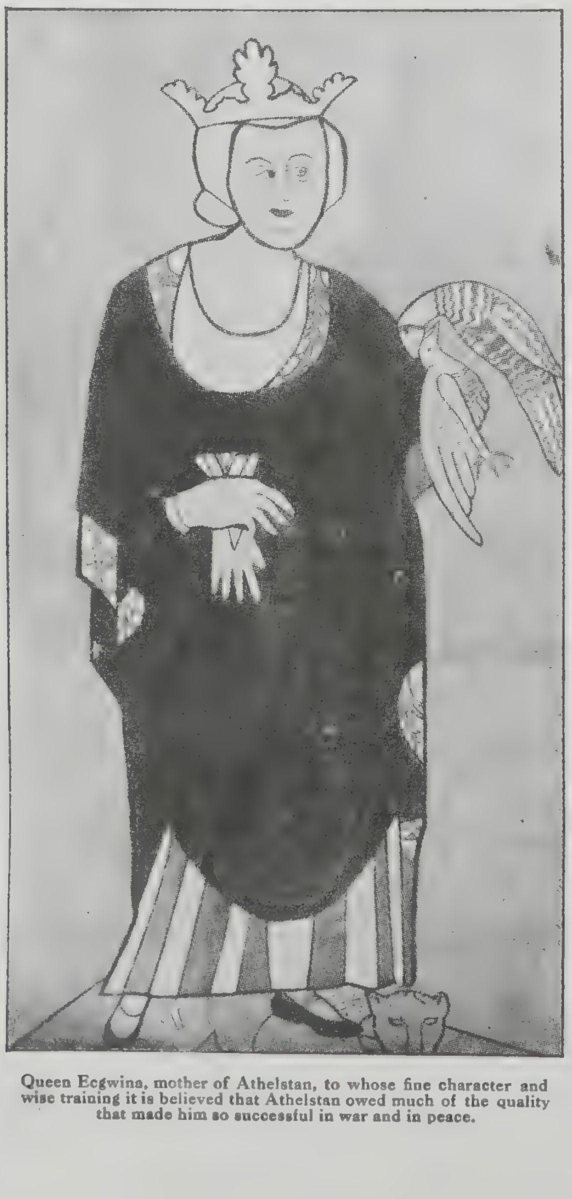
By PAUL TYNER

WHIT Monday is probably the most popular of English holidays. This year what was in many ways the most interesting and suggestive celebration of the day was one which yet has the tremendous distinction of marking with all possible fitness of historic pageantry the actual beginnings of all the glory and greatness of British power as symbolized on such a magnificent scale at Wembley.

The program began in the morning with a grand historical procession from Elmfield opposite the Grammar School to the Kingstonians' sports ground on Richmond Road. There were brief preliminaries in the shape of explanatory addresses by the Master of the Pageant, Dr. W. E. St. Lawrence Finny, five times a mayor of Kingston and now one of its aldermen. The special pageant play, "King Athelstan," was written for the occasion by Dr. Finney and admirably conveys the spirit and local color of the far-off time that marked the beginnings of the English royal sway that has since grown to such huge imperial dimensions. The play consisted of six acts or episodes: (1) Marriage of Edward the Elder, A. D., 893; (2) King Alfred Proclaims Athelstan, A. D., 901; (3) Athelstan's Coronation, Kingston, A. D., 924; (4) British King's Camp Near Penzance, A. D., 926; (5) Athelstan's Charter to Chertsey, A. D., 933; (6) King Athelstan's Court at Kingston.

Athelstan was the first King of ALL England. Up to his time, the tight little isle was split up into about a dozen rival kingdoms frequently warring with each other. Alfred the Great was simply King of Wessex (A. D., 871-901) until Mercia was added to his realm on the marriage of his daughter, Ethelfloeda, "The Lady of Mercia," to Ethelred, Alderman (or subregulus) of Mercia. But Athelstan, who was Edward's son and Alfred's grandson, and who is the king whose coronation was honored on its thousandth anniversary today, bettered his inheritance. By might of sword and cleverness of policy, he conquered and amalgamated all the remaining kingdoms under his own overlordship. The kingdom he founded has lasted for one thousand years and today exercises sway not only over the British Isles, but over nearly two-thirds of the whole land surface of the earth and about 400,000,000 persons.

During the sixteen years of his reign, King Athelstan distinguished himself no less in the wise statesmanship of peace than in victorious warfare. He had the good sense to turn every conquered enemy into a staunch friend, by letting him retain his title of king, exercising home rule within a territory whose boundaries Athelstan clearly defined, and subject to the laws of the Saxon Witenagemot, or Parliament. In return for the protection thus assured to his vassal, the latter was pledged to acknowledge Athelstan as his Overlord and to render him military service at call. It was only through this amalgamation of conflicting interests and forces that the Saxon kings were so long enabled to resist the repeated invasions of the Danes and practically to amalgamate the invaders when they did gain a foothold, so that it was not a Dane, but Harold, "the last of the Saxons," that fought William the Conqueror at Hastings.



Queen Ecgwina, mother of Athelstan, to whose fine character and wise training it is believed that Athelstan owed much of the quality that made him so successful in war and in peace.

We commonly call the composite race which today determines the destinies of mankind on this planet "Anglo-Saxon"; but it is really made up of Briton, Pict, Celt (of the Scottish, Welsh and Irish as well as Cornish varieties), Saxon, Angle, Norman and Dane, to say nothing of later admixtures of Italian, Huguenot-French, Spanish, Teuton. But the dominating element and spirit after all is the Saxon. And of the Saxon this doughty King Athelstan offers us a clear-cut type.

He was essentially democratic. The Witenagemot, which he established and built up into a truly representative legislature, could elect or depose kings. In Edwy's reign the members of this parliament deposed him and chose Edgar king in his stead. We are told that Athelstan lived a life of piety and rectitude. He was a keen soldier and a just judge and wise ruler. He set free a large number of slaves yearly with provision for their after care. He greatly modified the cruel and barbarous punishments that were characteristic of the age in which he lived, and prohibited altogether the capital punishment of youthful offenders.

He established a refuge for fugitive criminals, organized public markets, prevented profiteering, unified coinage. He translated the Scriptures into Saxon, the common tongue, and built many churches and abbeys—in those days the only "seats of learning" and benevolent institutions—liberally endowing them. That he was genuinely devoted to the good of his people is shown by the fact that he invariably shared the spoils of war between his soldiers and the great religious houses, keeping nothing for himself. He was as religious as Mahomet, always making baptism of the conquered kings and peoples a condition of peace.

One of his laws that showed much prescience was that under which any merchant making three voyages to foreign countries became a Thane and entitled to a seat in the Witenagemot. This practice was continued for hundreds of years under his successors and it needs no far stretch of the imagination to see in it a planting of seed from which has sprung Britain's marvelous mercantile marine and wide-flung naval power of today.

The Coronation Stone of Kingston bears a remarkable resemblance to the Scone or coronation stone in Westminster Abbey on which all the kings of Great Britain from James the First to the present king have been crowned.

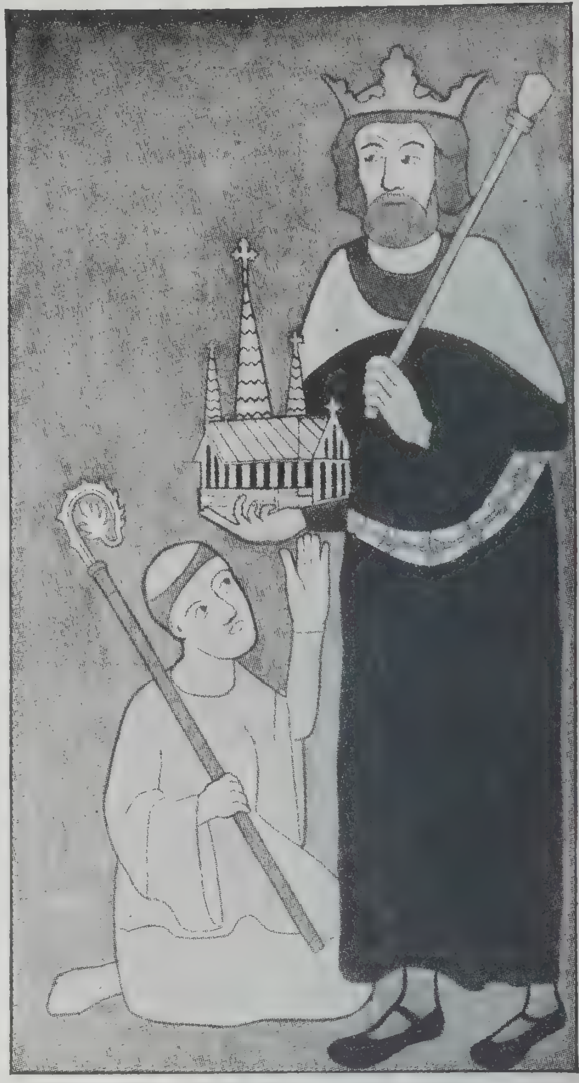
In his pageant play, Dr. Finney makes excellent use of the dramatic scene provided by King Alfred's ceremonial acknowledgment of the boy Athelstan as of the royal line. This is the culmination of a rather pretty romance in the life of Athelstan's father and mother. His mother, Ecgwina, was the daughter of a humble Saxon shepherd named Bercher, who lived in a forest village in Dorsetshire, probably the place known today as Athelhampton. She is described by old chroniclers as "a girl of transcendent beauty"—although one would hardly get this idea from the accompanying portrait. In the same village, lived Prince Edward's old nurse, and she and Ecgwina were fast friends. One day when the prince was hunting in the wood, he called to see his old nurse and there he met Ecgwina and fell in love with her. In a short time they were secretly married.

Of course, the secret got out and there were unlovely rumors afloat to the effect that the marriage was illegal, as a Saxon Prince was bound to marry only one of royal blood. At this time, Edward was not expected to inherit the throne, as his elder brother Edmund had been publicly acknowledged as the Atheling, or heir-apparent. Later, when Athelstan was seven years old, Edmund having died and Edward become Atheling, Alfred the Great heard of the boy's existence and, determined to refute the ugly gossip as to his legitimacy, publicly acknowledged him as a prince of the blood royal, greatly to the discomfiture of the villain in the play and to the joy of his father and mother.

Young Athelstan was well schooled in war as in letters. In one of his father's last battles, the youngster was given command of a division of the army; he routed the foe and having killed Leofric, the Danish leader, in single combat, he placed the head of the slain foe on the city gate at Chester. This made him popular with the army, of course, but aroused jealousy among the more indolent nobles.

Shortly after his own coronation, Athelstan married his sister Eadgitha to Sightric, King of Northumbria, the wedding being solemnized with great ceremony at Tamworth on January 30, 925. From any point of view, this was a very diplomatic move, as it attached to his cause a dangerous enemy. It turned out to be even luckier, from Athelstan's point of view, for about a year later King Sightric died and Athelstan took Northumbria into his own hands, driving out Sightric's two sons by a previous marriage. One of them, Anlaf, fled to Ireland, where he became King of the Danes in Dublin and a dangerous enemy to England. The other, Guthfrith, escaped to Scotland, where he received protection from Constantine.

Athelstan demanded of the Scottish king that he surrender Guthfrith into his hands. Constantine, fearing the results of a refusal—for despite his great repute for piety and humaneness, Athelstan did not seem to have any bowels of compassion when his purpose was crossed—brought Guthfrith south with him, but changed his mind on the way and let him escape. This seemed to infuriate the Saxon king, for he at once declared war on Scotland and marched north at the head of a strong force. Constantine of Scotland was subdued in short order and compelled to pay heavy tribute.



King Athelstan, the first King of All England, the one-thousandth anniversary of whose crowning was celebrated at Kingston near London. The portrait is copied from a painting preserved in Milton Abbey, Dorset.

Athelstan then marched against Owen, King of Wales, and that monarch had to pay a heavy tribute of gold and silver and of trained falcons before peace was signed at Hereford.

Then Athelstan "subdued" Eldred, the Prince of Bamborough. He next marched against the British in Devon and Cornwall, the country of the Celts known as the "West Welsh." Marching to Land's End, he crossed over to the Scilly Islands and there destroyed the naval base of the Danes. Returning to Cornwall, he built St. Buryan's Church on the first land he saw and granted it sanctuary rights and privileges. Later, he founded a Benedictine Monastery at Bodminton out of the spoils he had taken from the Danes. Here may be found a copy of the gospels in which is recorded the act of manumission made by Athelstan before the high altar and freeing forty-six slaves in thankfulness for his victories.

Athelstan's treatment of the conquered Britans evinced remarkable tact and foresight, as well as humanity, considering the savagery of the times. It had far-reaching consequences, for the Britons became his firm allies, so much that they turned against their former friends, the Danes, and fought with Athelstan against them. The consolidation, indeed, contributed indirectly to his crowning victory at Brunanburgh.

In the year 928, Athelstan held a Witenagemot at Exeter which was attended by King Huthol and the British Bishop and other British nobles, who were thus honored and recognized as allies, instead of being treated as subjugated foes. Saxon laws were enacted for Cornwall as for the remainder of England. Even a considerable number of those British who had at an earlier period fled before the invading Saxons and established the Kingdom of Armorica in Northwest France, hearing how well their cousins in Cornwall had been treated by Athelstan, began to return to their own country and range themselves under his banner.

As Athelstan's power and fame grew, so did the jealousy of his neighbors on the north. Suffering under the sting of one defeat and the heavy "reparations" exacted in consequence, Constantine, King of Scotland, prepared to avenge himself, bringing to his aid other disaffected princes who had scores of their own to settle.

In short course, a strong federation was formed for the purpose of destroying the Saxon overlordship in Britain. It included the Scots, Danes and Welsh already in the British Isles, together with Anlaf, the Danish King of Dublin whom Athelstan had driven out of his father's kingdom of Northumberland and who now sailed from Ireland with 615 ships. He was soon joined by the Danes and other Norsemen from Norway and the Baltic. Constantine was also joined by the Orkney men and the Picts, by Owen, King of Cumberland, the King of Wales and the Danes of Northumbria.

Athelstan, on his side, promptly set afoot preparations for the big fight. First, he visited Beverly Minster and placed the small gold sword that Alfred had given him on the high altar, promising to redeem it with rich

Salvaging the Wreck of the Movie Film

How Motion Pictures May Be Made Potent Auxiliaries of Education

The following is an extract from a remarkable article on the cultural effects of the film, by Max Suberkrub, which appeared in *The Eucken Review*, the organ of the Eucken Society. It is an extremely concise analysis of the educational value or otherwise of motion pictures, and contains a wonderful amount of constructive criticism marked by incisiveness and directness.

BEFORE I begin to discuss the cultural effects of the Film, I may perhaps be permitted a few remarks on the spiritual aspect of mankind, more especially the world of apparitions:

Nature alone is the primal cause of this. In every direction it sends forth its vibrations. In the brain of every man these vibrations take form and shape according to the play of the visual, the auditory and the olfactory nerves, and of all the other senses.

The whole process is natural: as the influence, so the picture. If the initial idea is true, the image thereof will be true also. So much by way of necessary prolegomenon: I now proceed to discuss the Film itself.

What does the Film set out to effect? It aims at the creation of a picture of events which is entirely true to life. If the Film produces a real and true picture, it must perforce produce a real reflex in the mind of the people. But if the natural events are transformed by the action of the Film, the picture will not appear consonant with reality, and the judgment to be formed upon it will depend, to a large extent, upon the personal feeling of the individual spectator. From this point-of-view, the question is: Can the Film produce natural events in a manner entirely true to life?

As we have already said, man's apprehension is natural. Nature is the *causa*: the brain is the receiver. In the presence of an actual event, all the senses are at work. Let us take an instance. When looking upon a burning house, we not only see the flames, but we smell the fire, we hear the crackling, perhaps even shrieks. We stand in the throng, careless of the weather, hypnotically gripped by the event itself. Or we stand upon the seashore. We see not only the foaming of the waves, but the mere impression conveys to us the thundering break of the surge: it is for us also to battle against the storm; and, drenched to the skin, we feel the power of the ocean.

All these natural events are accompanied by a host of tiny details. But the Film must produce something for the eye alone. And whereas in actual life each sense is occupied to a greater or lesser degree, the Film is capable of providing a mere substitute, or counterfeit, of varying exactitude or inexactitude.

So far as the human senses are concerned, our conclusions must be as follows:

(1) The imagination of the spectator must supply for itself the missing parts of the picture. This necessarily results in an overstraining of the senses.

(2) No time-limit is exacted in the case of incidents thrown upon the screen. This is counter to nature and reality.

When a Film is reeled off in this unnaturally quick manner, our powers of apprehension are outrun, and we cannot properly follow the sequence: all our senses are confused, and we are thrown back for enlightenment upon the textual indications of the Film.

If the Film represents incidents and events in a manner true to nature, the imagination will not be too sorely strained. But if the Film represents the events of human life in a manner that is false to fact, the result may spell disaster for an entire nation. Excessive concentration upon pictures robs one of the ability to estimate and to criticise natural life: through false productions we form false conclusions, which lead inevitably to false opinions.

An Analysis of Films

HOW, then, from a practical viewpoint, stands the Film today? I regret today that I myself was unable to draw any comparison between the so-called good films and those that are worthless. And this for two excellent reasons: first, because the notices in the daily newspapers are not by any means luminous in this particular respect; second, because the Film enterprises are not inclined to publish the programs of their plays. I must therefore content myself with quoting the statements of Walther Konrad. Out of 250 film-plays, he counted 97 murders, 45 suicides, 51 cases of adultery, 19 cases of temptation, 22 cases of kidnapping and 176 cases of theft. In other words: murder, 39 per cent; suicide, 18 per cent; adultery, 20 per cent; temptation, 8 per cent; abduction, 9 per cent; theft, 70 per cent. This works out at 164 per cent in 250 film-dramas. The criminal statistics of 1919 voice their opinion in this matter: in the years past, there were only 8.5 convictions: in every 1,000 persons—that is thefts, 2 in every 1,000; murder and manslaughter, only 1.8 in every 1,000.

These figures show that natural events have been represented in an unnatural manner.

But, on the other hand, it may here be objected that other social factors are at hand to influence the populace. The objection is plausible; but the fact remains that the influence of the Film is paramount as a means of influencing—and enslaving—the people. For the Film, like Bengal fire, enlightens their hearts with incidents, motives, and passions, lucid, monstrous, inconceivable in actual life, whereas the result of all the great spectacles of Shakespeare, Schiller and other dramatists have the power to influence and to thrill people for months, for years, and sometimes even for a lifetime.

All the passions, such as love, hate, fear, faith, satire, must find their place in the Film, and appear in as concentrated a manner as possible. In from ten to fifteen minutes one can see what one cannot read about in several hours. It is easy to understand that such film-material as Konrad has described, and as is so often shown upon the screens today, is apt to corrupt the senses and the nerves of the inspectors: even to the extent of bringing about disorders of the nerves, and actually leading people astray, in the way we continually read about in the police news.

These figures collected by Konrad point to something still worse than all this: he asserts that the Film has robbed the majority of the people of the sense of true judgment; and, through the repeated reproduction of unreal events in life, it has put them entirely on the wrong track. The worst calamity of all is that the false imagery of the Motion Pictures has made people lose every notion of truth.

Should Be an Educator

THE full extent of the evil effects of the Film upon the population at large cannot as yet be gauged; for there are no certain statistics to hand. However, these are assuredly cultural facts which indicate how the Film reacts upon the nation.

The Film should be a public educator on the largest possible scale; but this is still utopian, for the first experiments in this direction are only now in course of being made. To go into this particular matter more fully is, for the moment, outside my province; but I wish to state and to explain the real value of the Film, and briefly to hint how that value may be enhanced.

The Film should become an organ of Public education for the following reasons:

(1) An educational organ of this kind is very necessary today; for education has ceased to be the privilege of a single class, and it is recognized that the happiness of mankind is ultimately based, to a very large extent, upon its education.

(2) The film is evidently the cheapest and easiest organ of education.

(3) From the viewpoint of a sane and true Socialism, it is the most efficient weapon for winning a more exalted happiness for the majority of the people.

To insure success in the foregoing points, and to restrict and obviate all danger of mischief to culture, it is necessary

(a) to reproduce upon the screen the events of life in a lifelike manner;

(b) to abide, proportionately, by the fundamental decencies of life.

Moreover, if the Film is to become an educator of public opinion, the following additional points must be carefully borne in mind:

(1) All lies must be ruled out.

(2) Beauty must be imparted to the people; and this, by the display of the marvels of natural scenery, and by films demonstrating the growth of plants in every detail.

(3) The manners of life prevailing in other nations should be shown.

(4) Health films.

(5) Films picturing famous men, and the pioneers of Truth.

(6) Sport films (athletic demonstrations).

(7) Scientific films, explaining all the factors of National Economy.

(8) Scientific films, proving and setting forth theories, and so forth.

Up to the present, the Film has wrought great harm to the nation; yet it is potentially a powerful factor in imparting education. This question needs to be seriously investigated; but I must for the present confine myself to the points indicated above.

We have now traced the connection that exists between National Economy and Culture; and, as the result of our investigations, we may set down the postulates following:

(1) National Economy must be the support of the entire nation, to the end that Culture may be developed.

(2) But this Culture must be genuine and authentic: it must avoid all tension and aim at equipoise; and by the fact of stripping away all base and degrading influences, it will react upon the National Economy and render it prosperous.

That is the ideal. Let us now consider how far the Film subserves this purpose.

And first we must clearly determine what constitutes economic success in general. Now, if the employes of a firm squandered the savings of the owner in rioting and in alcohol, this is not economic success, but a crime. But if these employes were to use the money to give their children a better education, or to build houses, then it might be considered that a measure of economic success had been attained. It is from this standpoint that we desire to examine the economic advantage of the Film.

The increase of national wealth, through export duties, state and local taxes, and the employment of workers, is manifestly an economic advantage.

On the other hand, the fact that the Film subverts the moral life of the community, leads logically to the conclusion that the 4-5 milliard marks pocketed by the proprietors of the Picture-Houses are in the wrong pockets—especially when one considers that the bulk of the money is contributed by the working-classes. This can be statistically proved by the figures of the seating-capacities of the theaters, the takings, and the number of inhabitants of the different towns.

What could be done with the money?

(1) A theater of medium size requires for a year the sum of 3-400,000 marks: that is to say, with this money about 16,000 theaters could be kept up.

(2) How many institutes of education could be built, if one takes into consideration that the public library in Berlin needed (in 1909) about 250,000 marks to keep it going? This means that 20,000 public libraries could be provided for with this money.

And would not this money suffice to support universities and high schools in their financial distress? How many public institutions might be built in more than one city, on the lives of the exemplary institute of Popular Instruction founded by Professor Harms in Kiel: how many children of the working-classes might be given a free education!

But there is yet another side light to be thrown upon the cultural aspect of the Film.

As we have established, the Kinema to a very large extent impresses upon the public a totally false impression of the world at large; it robs the masses of a sound criterion of life, and helps to increase the tension between the classes. But the aim of true Culture is to unite. From a cultural point-of-view, the Film undoubtedly works havoc in the public mind: for instance, it creates bad desires, and fosters bad habits. How far this havoc has already gone can hardly be expressed: it is impossible to estimate it in numbers.

No doubt the national wealth has been increased by the Film. But no doubt, also, these material riches are—and will be—nullified by the concomitant decrease of culture. And, notwithstanding the apparent pecuniary advantage derived from the Kinema, it may yet turn out to be a positive disadvantage to economic conditions.

These are the facts. We cannot retrace our steps. As we have pointed out, the power of the Film is tremendous: the Kinema is packed with several million spectators day by day.

Steps must be taken to fight the evil tendencies of the Film, and to encourage and develop the tendencies that are good. All who recognize the truth, and who are cognizant of their strength, must straightway do battle for the sake of that truth—else they will sin alike against the laws of their interior being, and the laws which govern the world.

(Translated by Professor Samuel F. Darwin-Fox.)

Athelstan, The First King of All England

Concluded from page 12

spoils of war, should he return alive. He was also intrusted with the sacred banner of St. John of Beverley.

On the night before the battle, Athelstan had a narrow escape. Anlaf, his bitter enemy, had obtained admittance to the camp in the disguise of a strolling harper. Athelstan, learning that a plot was hatching, rearranged his camp, moving his own tent to a considerable distance. It so happened that the Bishop of Sherborne, coming late that night with a force of the men of Malmesbury, pitched his tent where the king's had been. The Danes attacked in the night and the bishop was killed in mistake for Athelstan. In recognition of the bravery of the Malmesbury men in this scrimmage, Athelstan granted special privileges to their town, which it enjoys to this day, the Malmesbury burgesses holding an annual "Athelstan Feast" to preserve these valuable rights.

In this battle, Athelstan made use of his fine military training and skill as a strategist. He won a victory which was accompanied by the greatest slaughter ever known up to that time in English warfare; five kings, seven earls and Constantine's son being among the killed, which ran into the thousands. The Danish power was at last completely broken and Athelstan's rule as King of All England was securely established.

Athelstan founded Milton Abbey in A. D. 929. It was built in the woods near the village of his childhood and he devoted himself, when he was not busy fighting, to enriching and strengthening that religious house.

Athelstan's reign came to an end with his death on the 27th of October, 940, at Gloucester. He was buried at his own request in Malmesbury Abbey, where his tomb is still to be seen.

Sapiro Rust in the Northwestern Hay Crop

Concluded from page 10

of the gross selling price of the crop, while, as a matter of fact, that cost was actually eighteen per cent.

> If all the 10,000 tons of hay controlled by this association in the district under discussion had been sold at $15.80 a ton, the farmer would have received $13.80 a ton net. But, the interest on the $210,000 which the association owed would have taken approximately $1.41 cents more from the price received by the farmer for every ton of his hay, leaving him $12.39 cents a ton, or sixty-one cents a ton less than the independent grower received. To a man raising an average crop of 500 tons of hay, this means a loss of $305, not a small item in his annual budget.

Then, along in December, 1923, when discontent began to spread through the membership, the association issued two statements. The first was that four dollars a ton would be advanced to the growers; the second was the flat order that all the hay grown by all the members of the association had passed definitely out of the farmers' ownership and control when he became a member, that it belonged to the association, and that the association would dispose of the hay as it saw fit, without reference to or consultation with the growers. The first statement was made in writing; the second was issued verbally through the district managers, agents and other employes of the association. For high-handed dictation to and domination of supposedly free American people, this second statement takes first prize; not even Koykendal and Sapiro's henchman, Levy, ever tried anything quite so bold as this on the prune-growers of California.

When the farmers went to get their four dollars a ton "advance" on their crop, an advance for which they had waited more or less patiently for nearly six months, a few of those who had been the first to join the association, and had used their influence to get others to join, received the money. The majority got nothing, and haven't got it yet. One man near Walla Walla, who had signed on to deliver 100 tons of hay to the association, went to get his money, and was passed from one to the other of five "officials" of the association before he was finally told that he was "too late, because the time limit on that four-dollar offer has expired."

But there was a little balm in Gilead, though Mr. Sapiro did not put that balm there. A farmer in the association, so sorely pressed for money that his bank was preparing to foreclose on his farm, and the tradesmen had refused him more credit, appealed to one of the independent growers. This grower took him to the independent dealer who handles more hay every year than the association. This dealer had his attorney look over the contract which the farmer had signed. Between them they discovered that this contract was predicated on the signing up, by the association, of seventy-five per cent of the acreage. The seventy-five per cent had not been signed, and the independent dealer bought the hay from the member of the association, paid him thirteen dollars a ton for it, and agreed to stand by him, if the association attempted to carry the contract into the courts. This the association never has attempted to do, and other farmers similarly involved have been selling their hay, though time and the elements have depreciated it in value, to the independent dealers. In an endeavor to stop this selling, the association agents have attempted to bulldoze the farmers, until some of the latter have brought out the old shotgun and literally "run the agents off the ranch."

The latest contribution to the condition of the hay-growers who are in this association is a letter from the management of the organization, saying that there will be no money available for payment for the 1923 hay crop until July 1, 1924. This is nearly one year after this hay was delivered to the association, and is almost the date for the delivery of the 1924 crop. If this association nets six dollars a ton to its members for their hay, provided that the hay is sold, it will be doing far better than there is any reason to expect. That is to say, the farmers in the association are paying seven dollars a ton on 10,000 tons of hay, or approximately $70,000, for the privilege of using Mr. Sapiro's California plan of "orderly marketing." And they will keep on paying it every year, just as long as they remain members of the Northwest Hay Growers' Association. This, remember, is entirely exclusive of the sums these same farmers have to pay for marketing their crop through the association, that is, two dollars a ton for a service which costs really one dollar, and, in addition, $1.41 a ton, interest on a debt which the farmers ultimately must pay. Neither Mr. Hunt, Mr. Sapiro, nor any of the other gentlemen, clear back to Mr. Otto Kahn, in New York, all faithful friends of the American farmer, will have to pay it. But the farmer will pay it, down to the last penny.

At least two young men in the association realize this, for they have sold their farm to their mother, and have gone to work for her for day wages. They live just outside Walla Walla. Another who had rented a farm for several years, producing annually 500 tons of hay, which he had sold at a cash price of $6,000 to $6,500 every year, joined the association last year. Today his hay is rotted in his fields, he is "broke" and working as a hired hand for an independent hay-grower, to support his wife and children. Yet the 3,000 tons of hay which this association is known to have sold, and which its agents claim was sold at $15.80 a ton, should have brought in $47,400. Where is the money? The farmer doesn't know, and the association which he thought belonged to him will not tell him, so we must add it to the $210,000 debt the association has wished on its members. That makes $257,400. There are approximately 10,000 acres of hay land, producing three and one-half tons an acre, in the Walla Walla district, while, in all Washington, there are about 82,000 acres, similarly productive. This land ranges in value from $150 to $200 an acre. As nearly as can be ascertained, about one-third of this acreage is signed up in the association, or, let us say, in round numbers 28,000 acres. On every acre of this signed-up land, there is a burden of debt, due to the association, of approximately ten dollars an acre, for to the total of $257,400 mentioned above, must be added the interest on $210,000.

What has become of the money involved in this transaction, no one—least of all the farmer—knows, but they are beginning to suspect.

One farmer, a prosperous hay-grower for years, signed a contract to deliver 100 tons of his annual crop of 600 tons, average, to the association. A few days after he had signed, an agent of the association came back to him with a new contract, saying that the old one had been destroyed in the filing process in the office of the association, but that the new one was the same as the old. The unsuspecting farmer signed, and has since found that the new contract turns over not 100 tons, but ALL his crop to the association for five years.

He has broken this contract, sold his hay to independent dealers, and is ready to go into court at any time.

The Northwest Hay Growers' Association, however, is not quite so ready.

"Bootlegger" Dentist a Menace to Public Health

Concluded from page 9

board's order. The attorney-general was sent a transcript of the dental board's findings many months ago and so far has not moved to try the appeal. He says it is the duty of the local district attorney to try the case, and that individual answers that it is up to the attorney-general to try appeal cases. Here is one of the reasons that lawyers in general are regarded as lacking in civic spirit. The public should be chiefly interested in the great central fact that the greatest responsibility of the dental profession is to prevent, not merely to restore. There are not nearly enough reliable dentists to serve the people.

There are about fifty thousand dentists in America; more than in any other country. There should be an average of one dentist to every thousand people if the people are to be well served. About 2,000,000 patients visit dentists' offices every day.

There is only one kind of economical dentistry. That is when the teeth are regularly examined and treated before there is a record of pain. It costs less, hurts less and better work can be done.

Neglect of childrens' milk teeth is just as serious as that of their mature ones. Some make the blunder of doing nothing until the children's first teeth are gone.

Many parents don't seem to realize the dental needs of their children. College dentists find many flappers wearing fur coats who are only interested in having nice looking front teeth. A little old-fashioned family discipline is needed in such cases.

Keeping one's teeth clean by use of the tooth brush and also by periodical cleaning by a good dentist who will remove calcified spots before decay can break down the enamel is essential to good teeth and low dentist's bills.

If one's tooth brush is dipped in alcohol after its use and cleansing under the faucet and then kept in a glass tube it will be clean and pleasant to use. The occasional brushing of the teeth with a little flavored chalk, procurable at the druggist's, will be worth more than all the widely advertised dentrifices, according to a dental surgeon whose endorsement is vainly sought by the makers of these trade-marked preparations.

The absurdity of the claims of some of these advertised dentrifices puts their makers on a level with the dental quack. One cream that is declared to contain a medicinal element that will kill decay has been tested with this result: It would require an application of thirty-eight minutes without any disturbance by the flow of saliva and the friction of the tongue and gums for the preparation to take effect to the slightest degree.

Some will be moved to inquire how they can select a good dentist. It should be borne in mind that there are non-advertising dentists with ornate offices in fine buildings who are just as worthless as the fellows with electric signs and big painted teeth.

One does not have to visit the fashionable, highest priced dentist to get good work. There is a group of fine, but moderate-priced dentists whose work is entirely reliable. Careful inquiry will enable them to be found. If one has a reliable physician he can usually refer you to a good dentist.

The worth-while dentist does not end his education with the completion of his formal college course. He is constantly attending clinics and lectures and maintaining contact with the helpful leaders of his profession through affiliation with his local, state and national societies. One authority has suggested the need of a public classification of practitioners according to the extent to which they supplement their college work by these means.

Several dental dispensaries in various cities have clearly demonstrated the value of preventive dentistry. A five-year test by the Bridgeport dispensary gave this remarkable record of the reduction of the most common fatal disease of children:

Diphtheria was reduced from 36.6 per cent to 18.7 per cent; measles from 20 per cent to 4.1 per cent and scarlet fever from 14.1 per cent to .5 per cent. There was also a decrease of 50 per cent in children retarded because of lack of mental efficiency. Bridgeport had a smaller percentage of children's deaths from influenza during the great epidemic than other cities of its class.

In Rochester the most advanced and useful dental dispensary in the world has been created through the leadership of William Bausch, a manufacturer, and the financial support of George Eastman.

The Rochester dental dispensary takes children up to the age of sixteen. In 1923 there were 67,530 visits of patients to the dispensary and 58,253 paid five cents each. The dispensary has squads of licensed dental hygienists who clean the teeth of school children in the school buildings under a contract with the board of education. These hygienists are provided with portable equipments consisting of chair, cabinet, engine, sterilizer, and so forth. In 1923 prophylactic treatments were administered to 92 202 school children.

Straightening crooked teeth is one of the most important features of the Rochester dispensary. Not only is the appearance and the comfort of the child greatly improved but there is also an improvement in speech. Not infrequently children below normal mentally have been greatly helped by the removal of the nerve pressure usually found in a crowded jaw.

Another department deals with the related field of tonsil and adenoid work, harelip, cleft palate and other surgical operations around the mouth. Since 1919 operations for tonsils and adenoids have been performed upon 7,171 children.

A simple, attractive building was erected and equipped by Mr. Eastman at an expense of $400,000. He has also provided an endowment of $1,800,000. Through these provisions the dental prevention work among the children of Rochester has been placed beyond the reach of politicians.

Flint, Michigan, has just provided an edifying illustration of what the aldermanic mind thinks of saving children's teeth. Through the co-operation of a splendid dentist and the then mayor, a well-known industrial executive, a dental dispensary was established. The many foreigners in Flint resented the clinic at first but soon became enthusiastic.

Dentists throughout the Middle West began to have hopes that the Flint dispensary would pave the way for other small cities adopting the plan, but were disappointed.

During the war American soldiers were struck with the poor condition of the teeth of British soldiers. Those quartered in England noticed that the population largely went without dental work. In fact all foreign countries, with the exception of some German districts, have neglected dentistry. The elaborate dental service of the American army was marveled at in Europe.

England has now sent to the Rochester dispensary for advice and suggestion for the purpose of framing dental legislation and also for plans for the establishment of dental clinics. Australia and New Zealand recently sent personal representatives to Rochester for the same purpose.

Italy's Symbol of Friendship

ON THE shore of the blue Mediterranean, near Carrara, Italy has decided to set up a marble statue of Prometheus which will be at once a lighthouse and a memorial of the poet Shelley, who was drowned off that coast a century ago.

The height of the figure will exceed 180 feet—greater than the figure of Liberty at the entrance to New York Harbor, and comparable with no statue of which there is any record, unless it be the celebrated Colossus which bestrode the harbor at Rhodes.

The sculptor will be Fontana, who has already executed works of great magnitude, notably the statue of Garibaldi at Sarzana, twenty-four feet high, and the great Quadriga at Rome.

In an interview with Signor Fontana, which appears in the Manchester *Guardian*, it is stated that the decision to erect the lighthouse-statue coincided with the hundredth anniversary of Shelley's death. The poet's body was cast up on the beach a few miles from the spot where the memorial will stand.

Shelley made the legend of Prometheus the groundwork of one of his greatest poems, and "Prometheus Unbound," bearing the torch of freedom, will send beneficent beams over the waters which became his grave. The mountains close at hand will furnish the marble.

Although the primary idea of the memorial is inspired by the fate of Shelley and his connection with Italy, it is also to be regarded as a symbol of the friendship between Italy and Great Britain, and their alliance during the World War.

In the model of the statue, which has just been completed and which is forty feet high, the figure of Prometheus is represented as carrying the stolen fire to the world of humanity. One hand clasps some of the flame to the breast, the other holds it aloft and lights the beacon. The figure will stand on a rough-hewn pillar of marble, with a rough-hewn base of the same material.

The lines of the countenance depict pain—but pain overcome by supreme effort, for the sake of carrying relief to "a world pining in pain."

Sentiment as Savior of Natural Resources

Eminent Novelists' Strong Appeal for Conservation of Woodlands

By T. M. VESEY

THE NATURAL resources of this continent have supplied North American writers—more especially novelists—not only with a large proportion of their settings, but with no inconsiderable percentage of their actual themes.

Stevenson once said that "some places speak distinctly—certain dank gardens cry aloud for a murder, certain old houses demand to be haunted, certain coasts are set apart for shipwreck." And in support of his contention that one may first happen upon a setting and afterward get action and people to realize and express it, he cited the case of his own remarkable story, "The Merry Men." "There," he confessed of its genesis, "I began with the feeling of those islands off the West of Scotland, and gradually developed the story to express the sentiment with which the coast affected me."

In how many hundred instances has a cataract, a stretch of "white water," a log-jamb, an oil-field, a mining camp or a timber limit supplied the inspirational impulse for an episode or even the *motif* of an entire story.

Sometimes the author has made use of the material at hand without any conscious knowledge of its significance other than as "local color," "atmosphere," "setting," "locale," "background," or whatever name he chooses to assign to those literary accessories which constitute the scenes amid which his characters move. His imagination simply seizes upon them on account of their value to him as an arena in which to set his drama. A classic instance of this use would be the environment in which Fennimore Cooper's Indians moved; while a contemporary illustration might be found in Cody's handling of New Brunswick woodland scenes.

In other cases the author has been deliberately and more acutely aware of the precise significance in life, as distinct from fiction, of these natural appurtenances; in which cases the settings themselves have usually formed an integral and essential part of the story—a scene in which no other kind of story could be plausibly enacted, and one without the aid of which the particular story could not have been written. Robinson Crusoe would be about as imaginable bereft of his island as the play of "Hamlet" minus the Prince of Denmark.

Harold Titus' "Timber" and Madge Macbeth's "The Patterson Limit," the first dealing with the Michigan pine woods and the second with Northern Quebec, are instances of plots actually developed out of the scenes and the industry which form the settings.

"Timber" was described—in the jacket-blurb, it is true, but not necessarily incorrectly because of that circumstance—as the first conservation novel; and Mrs. Macbeth's more recently published story can probably lay claim to being the first Canadian conservation novel.

It is not difficult to understand why, of all our natural resources, forests should for long have offered the brightest lure to the producer of fiction. Leaving aside the physical beauty of sylvan scenery, which clamors to be described, timber is one of the oldest of our resources. The natural features were, of course always there but they remained the rawest of raw materials until man's inventive faculty brought them into general use.

Canadian timber, as a case in point, definitely came into the category of natural resources when the woods of Nova Scotia and New Brunswick were ravished to supply the king's frigates with masts on which to fly the Union Jack in defiance of all the Frenchmen on the high seas.

Ralph Connor's "The Man from Glengarry," the filming of which aroused so much interest in the Ottawa Valley and in Northern Ontario, is another example—a lumbering story in which the story rather than the lumber was the mainspring.

And this brings us—by, as Mark Twain said, "a natural and easy transition"—to the question of what positive propagandist value, in relation to conservation, there might be in fiction. The two conservation novels already alluded to were written with the definite object of attempting to reach "the great heart of the public" (and thereby imbuing it with a realization of the disaster involved in the disappearance of our timber resources) by means of educative dialogue and dramatic action, without lessening the appeal to the general reader. For after all, the primary purpose of a story is to interest, and if it fails in this particular it fails entirely.

The question that at once arises is: Are such stories likely to attain a sufficient degree of success in their twofold object to warrant their production? On the negative side it must be conceded at the outset that as a general thing the reading public does not take kindly to fiction having for an underlying object the uplift of the community. Still, there have been notable exceptions to this rule and that this indirect means of disseminating useful propaganda and expounding constructive ideas through the lips of imaginary characters has its tremendous advantages has often been made manifest.

Despite an increasing community desire for general enlightenment—evidenced by the earnestness with which many of the young people of to-day regard national problems—there is still far more fiction read than any other literature with the exception perhaps of daily newspapers. Propaganda, to be thoroughly effective, must reach those who are open to conviction. It does not require salesmanship to sell a man what he wants, the real science consisting in first convincing a man that he wants a thing and then in selling it to him. So the indirect method of educating via the channel of recreative reading cannot be without its value.

To give yet another classic instance (this time illustrating the driving force of fiction applied to readers who, when they commenced to read, had no idea of the lengths to which they would be driven) "Uncle Tom's Cabin" played no negligible part in defeating the Southern Confederacy. And to come down once more to modern times, Upton Sinclair's "The Jungle" was responsible for the investigation resulting in the reformation of conditions in the Chicago packing houses.

Norway pine, "big timber," on Star Island, Minnesota National Forest, Minnesota.

Sinclair himself said that after aiming at the "great heart of the public" he had hit its stomach. Galsworthy's "Justice"—a play—was mainly if not wholly the impelling force toward prison reform in England. Its production resulted certainly in the appointment of the Royal Commission which inquired into the defects that existed in the penal system twenty years ago. The reason the average "novel with a purpose" fails is that it is so crudely executed that it does not interest.

In the cases of the two conservation novels already alluded to in neither of these stories was fictional interest sacrificed to conservation encouragement; yet the plots of both hinged wholly upon the fight for the forests. Readers having no knowledge of protective efforts could find no lack of absorption in the adventures of the characters, while the real significance of their motives could not fail to be appreciated. The following, for instance, from "Timber," is dramatic enough, and at the same time carries its own serious message:—

> "They're gone, the old Michigan stands, but there's a new forest coming on, here—we're in the heart of it. If I should sell to you and you should run twenty million a year, which was big those days but isn't now—Foraker's Folly wouldn't last long. But if we go through with my father's plan—you and I—we can cut four million and up a year—forever."
>
> "Moonshine! It's—"
>
> "No, it isn't a dream. It's real. It's as real as those trees outside my house. The last faller hasn't cried 'Timber!' for the last Michigan white pine. We haven't seen the last of it going down iced roads to the dumps; we haven't seen the Blueberry bank-full in the winter time with white pine logs for the last time! We haven't seen the last drive; we haven't heard the last pine log going against a saw here in Michigan; we haven't seen the last pond full of them, floating fine and high. . . ."

Reading a passage such as that, even the veriest tyro will be bitten by a salvaging enthusiasm, and will probably exclaim, mentally at least: "Well, I hope not, at all events!" And when next the conversation turns upon the subject of our vanishing resources he will be among those who agree that "we mustn't log off all our timber lands without doing some replanting to replace what we take away."

Or the subject may be approached by deftly holding up to ridicule those narrow, self-satisfied persons who fail to realize that the land might conceivably have some destiny other than that of providing a comfortable stamping ground for themselves. Madge Macbeth adopts this method in her delineation of the mental attitude of the typical small-town social circle:

> To them, a tree was merely a tree, set in a certain locality—heaven knew when or how—and distinguished from others of its class by names such as ash, larch, oak, pine. Trees grew conveniently or inconveniently. If inconveniently, they were ruthlessly cut down; otherwise they were unmolested and in the fulness of time, they died. Crewsbury would have been scandalized to be told that thousands of feet of timber are destroyed each year, not by the design of God, but by the ignorance, the carelessness of man, and any effort to prevent this destruction or repair this waste would have seemed like tampering with Nature, and tampering with Nature was synonymous with offering advice or a reproof to God!

The keenness of the thrust delivered by this style of writing is enhanced by the fact that it aims straight at the self-esteem of the reader, forcing him to retain his good opinion of his own common sense and broad-mindedness by dissociating himself from the views of those described. Hence he becomes, practically by mental necessity, a convert to right thinking. And he, too, when next the talk turns to the price or paucity of, say, newsprint, is one of those who urge his fellows to realize that a tree is not merely, and ultimately, a tree, but is in its wider signification a natural resource.

Desolation follows in the track of the lumberman if no steps are taken to replant. This picture gives a vivid impression of what cut-over land looks like when utterly neglected.

Study in Race Appreciation— The Italians

Concluded from page 2

times looks with unseeing eyes on his American surroundings, for his mind's eye sees only the eternal smoking of his own Vesuvius, the blue waters of the Bay of Naples and the azure sky of Italy. Our American poet, Thomas A. Daly, has caught with rare sympathy the homesickness of the beauty-loving Italian for his homeland. And the lure of Italy for its sons in America is shown by the fact that about one-third of them return to remain in Italy.

If those who are linguistically inclined will apply some of the first principles of teaching English to a few lessons for themselves in Italian, they will get an idea of the liquid beauty of a language which contains some of the world's masterpieces of literature.

The modern political development of Italy has been truly called "the awakening of a great race." Mazzini, Garibaldi, Cavour and Victor Emanuel were the seers and the makers of modern Italy as far as a national spirit is concerned.

It was in 1871 that Italy was made politically a union with Victor Emanuel II as king, but it must be said that in no true sense was there a union of the Italian people until during the past few years.

It was as Massimo d'Azebelio said: "We have made Italy; we must now make the Italians."

Though her founders had a spiritual vision, modern Italy has as yet not had time to utter a spiritual message.

Until the war she had only been able to enter the first stage of nationalism—namely, that of becoming a people united in unconscious feeling. The war did more than all else since the political union to make the Italians conscious of their unity. Today the Fascist movement under the dominant leadership of Mussolini, the organizer, has made modern Italy conscious.

It may be said that the Italian environment, history, and ideals have selected out from the heritages of all the diverse peoples in Italy until there is an Italian national feeling. The problem, not an easy one, of the makers of present-day Italy will be to construct a permanent political unit, with respect for minorities, out of the many existing diverse elements which survive the past centuries of racial and political instability.

Some whales travel twice a year more than a quarter of the distance around the world. They will be in the Arctic regions in the summer and on the other side of the equator in the winter.

The highest telephone in the world is located on the summit of Pike's Peak in Colorado, at an elevation of 14,110 feet.

In South Africa the government has appropriated $1,500,000 to fight a plague of locusts, the worst on record. In one district near the Orange River a single swarm of locusts, which extended in an unbroken mass 150 miles in length, is reported to have devoured all vegetation.

The automobile industry uses fifty-four per cent of the upholstery leather supply of this country.

When John Milton died he left three thousand dollars to his wife, who, by the way, was his third wife. When she died, at her request, a tombstone was erected over her grave which bore the inscription: "Elizabeth, the third and best wife of John Milton, the poet."

Only one hundred of the four hundred twenty-five miles of railroad which would carry the products of the great northwestern grain-fields of Canada to salt water at Hudson Bay remains to be finished. However, due to the fact that it will cost approximately $22,500,000 to complete the railway, erect terminals and dredge the channel, it is doubtful if the work will be finished.

Prickly pear cactus, imported into Australia from America in 1788, has spread to such an extent that thousands of acres of land in that country is worthless for cultivation.

More than 4,000,000 illiterates will be entitled to vote in November for President and for members of our Congress. If organized they could control the balance of power in the United States.

The American aviators in the round-the-world trip are flying Douglas machines with 400 horse power engines. They weigh 4,300 pounds and in each case the lift is 2,615 pounds, counting men, food, equipment and fuel. The total weight is 6,915 pounds. The span of the machines port to starboard is fifty feet and they fly at about eighty miles an hour at normal speed.

The Filipino market woman squats on her heels beside her wares and rolls her betel nut with oyster shell lime in a bitter leaf before chewing it. The nut blackens the teeth and colors the mouth blood red, but the natives deem it a satisfying and healthful indulgence.

The Shuberts have canceled their plans to produce revues, and buy or build theaters in Germany. Many newspapers published warnings to actors and chorus girls that the Shuberts mistreated actresses, paid badly, did not pay for rehearsal time, and generally did not deal with artists as European managers, it is said. Several newspapers are said to have invited the Shuberts to remain away.

The first free library given by Andrew Carnegie is in Dumfermline, Scotland, and was dedicated on July 27, 1881.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

"Whether the road be long or short, the day must and will come when the nations of the world will submit themselves to definite rules of conduct, whose violation will receive the united condemnation of mankind."—*Hon. John W. Davis,* Presidential Nominee.

A mining engineer has estimated that it took ten thousand men one thousand years to perform the ancient mining work found in Isle Royale copper workings. Not less than one thousand tons of broken hammers alone have been found in the ancient diggings.

The Jewish press reports that when the strong K. K. K. delegation from Georgia arrived in New York for the Democratic Convention, it became a question who should greet them. So a Jew was sent to do this office.

The Black Stone at Mecca is the most kissed object in the world; even more kissed than the Irish Blarney Stone. No true Moslem, after having made a pilgrimage to Mecca, would think of leaving without first kissing this sacred stone.

The largest map in the world is being made in San Francisco. It is 600 feet long and eighteen feet wide, and shows all the natural as well as man-made features of California.

The idea of circumnavigating the globe in the air is 120 years old. In 1804 a Belgian aeronaut named Guillaume-Eugene Robertson proposed to scientific societies of Europe the construction of a huge aerostat for an aerial voyage which would circle the earth. The idea was received indifferently and the matter was dropped.

Weaving was practiced in China more than a thousand years before it was known in Europe.

A skeleton believed to be that of King Richard the Third, who was killed at the battle of Bosworth Field, in Leicestershire in 1485, has just been unearthed and handed over to the Leicester museum.

A determined drive on the behalf of the metric system will be made at the Pan-American Standardization Conference, which is to meet at Lima, Peru, in November.

According to a statistician of Munich, Germany, every thirteenth inhabitant of the world lives in a city of more than 100,000 population. In Europe alone the proportion is even greater than for the whole world, for every seventh person on European soil lives in as large a city.

The War of 1812 ended 169 years ago, but Uncle Sam still pays pensions to twoscore persons because of it. It is reported that one soldier's pension was not paid until ninety years after the last batle was fought.

Of 293,488 houses destroyed in the earthquake in Japan last September, 144,797 have been restored.

During the nineteenth century the population of the world grew from 640,000,000 to 1,600,000,000. It is increasing at the rate of 20,000,000 a year during this century.

Lewis B. Reed, who recently celebrated his one hundredth birthday anniversary in Los Angeles, California, is said to be the oldest college graduate in the country. He graduated from New York University in 1843.

An Inca mummy, believed to be about 2,000 years old, has been discovered near Arica in Chile by Max Uhle, an archeologist.

Bills providing for the construction of a national art gallery are being prepared for introduction into Congress should funds for the structure not be raised by gifts and bequests by this autumn. Charles Platt, of New York City, has been commissioned by a group of art patrons, who have subscribed $10,000 to design the building.

Gambling is a criminal offense under Japanese law.

America's annual loss through embezzlement by trusted employes has increased five times over since 1910, and is still increasing. E. A. St. John, president of the National Surety Company, estimated the country's present loss at $100,000,000 to $125,000,000 a year.

The establishment of a cotton mill in Pawtucket, Rhode Island, by Samuel Slater, in 1789, marked the introduction of the factory system in the United States. It did not gain a foothold, however, until the first protective tariff was passed in 1816.

American exportation of $75,000,000 worth of electrical machinery and apparatus in the fiscal year 1924, against $25.000,000 in 1914, and $10,000,000 in 1904, illustrates the rapid increase in the world use of electricity.

The world's oldest building still standing above ground has been discovered by an expedition from the British Museum, London, and the University Museum, Philadelphia, at Tell El Obeid, Babylonia, four miles from Ur. The building, which is more than 6,000 years old, moves the already ancient history of Babylonia back another 1,000 years.

Among the first records of paper-making in the American colonies was that of Leffingwell, of Connecticut, in 1768.

Study in Race Values—Italians

Frugality Fostered on Twenty-five Cents a Week

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.

Copyright, 1924

In this, the second part of the article, the writer deals with the adjustment of Italians to American conditions.

Photo by Jenks

Blond and brunette Italian sisters—born in Cleveland, Ohio.

SOME 4,500,000 Italians have come to the United States—of whom much the largest per cent were South Italians. In the first half of last century they began to be noticed among our immigrants, but not until after 1854 did we receive more than 1,000 in consecutive years. Twelve thousand came in 1880—from which date began a steady increase. In 1900, Italian immigration reached the 100,000 mark, and not until after the year 1914, the last normal year of immigration, did the annual inflow fall below that number.

From the year 1899 to 1923, inclusive, we received from Italy 3,761,777 immigrants. This means that 22.2 per cent of all our immigrants during that quarter of a century were Italians; this percentage is more than twice as high as the next lower group, the Hebrew.

The Italian migrates to other countries besides America. Italian sources of information show that for seventy years Italian emigrants have been going in increasing numbers to all the Continental countries of Europe, as well as to the British Islands, North America and South America. Immediately before the World War the number of emigrants was roughly 1,000,000 a year, of whom 300,000 or 400,000 returned annually. During the first ten years of this century more than 48,000 went to Canada.

To Argentina up to the year 1908 ten times as many Italians had migrated as any other people except the Spanish. In 1908 Argentina had 1,771,971 Italians, or more than twice as many as the Spaniards themselves, though the language of Argentina is Spanish. Into Brazil also the immigration of Italians is greater than of any other people. Their nearest numerical competitors are the Portuguese. Up to 1907 there were 1,213,167 Italians and 634 585 Portuguese in Brazil—yet we speak of Brazil as Portuguese, and its language is Portuguese. Italian migration to these countries still continues. In 1923 Argentina received 94,000, Brazil 15,000, while Canada's Italian immigration was 6,400.

What is the cause of this dispersion from Italy until it is even a world phenomenon?

Why do more people emigrate from Italy than from any other mother land?

The first cause is *overcrowding*. In 1881 there were 257 persons for each square mile in Italy; this means about ten times as many as in the United States. But in twenty years Italy's density increased from 257 to 294, and in 1918 it was 372 for each square mile.

Thoughtful Italians have deplored the loss of so many emigrants. A university professor said, "We must stop this hemorrhage—are we Italians breeders for the nations?"

But in spite of Italy's extreme emigration she is not emptying her home nest, and there is no indication that her emigration will soon decrease. I stood in the doorway of a farmhouse three miles from Agrapoli, not far from Naples, with an Italian youth who had returned from Pittsburgh to that farm birthplace of his. We looked out over the beauty and richness of the Italian landscape and I asked: "Why did you go to America?" With appreciation for the reason of my question, he said, indicating the vineyards before him, "There were eight of us brothers for this small piece of land."

The second cause of Italian emigration is *poverty*. Italy is impoverished because in this day of industrialism she possesses such scanty natural resources or raw material. Her agriculture and zooculture cannot be great because not only is her land poor but it is the most mountainous of all the large countries of Europe. Oranges, lemons, olives and grapes are valuable products, but they are not staple foods for the maintenance of life. Italy produces no "staff of life" for her people, except wheat. The Italians are hard workers, yet the scale of agricultural wages published by Italy for 1905 shows a maximum of forty-five cents a day with a minimum wage of twenty-six cents and a mean of only thirty-four. To this should be added about one-third for provisions furnished, making the highest wage sixty cents a day, and the mean forty-five cents.

We should mention *excessive taxation* as the third cause for Italian emigration. About one-fourth of the annual wage of her people is gathered by the government in various taxes.

From these three causes of Italian emigration may be deduced the lure which draws the Italian to America. It is almost one hundred per cent economic; it is higher wages.

In all four parts of Italy—Northern, Central, Southern, and Islands—the largest percentage of migrants are from those localities where the number of modern industrial plants is lowest.

Amalfi on the sea. Such scenes as this make "The Amalfi Drive" justly world-famed.

Since the Italians have come to America in such large numbers, it may be wise and reasonable for us to attempt to see what besides mere numbers they seem likely to contribute to America.

The anthropologist takes long visits of time into consideration when he thinks of the people of a nation, so he looks to see, first, *whether the race maintains its numbers*. No matter what splendid qualities a people possesses, it is of short life unless the group perpetuates itself by normal families of children.

We have already noted the numerical increase of the Italians, so we name as an important Italian characteristic, that biological and social fact, *fecundity*. A people whose births over deaths is annually about 400,000 or whose rate of annual increase is 1.176 per cent has a future. In America, the Italian women of the first generation have more children than any other group except the Canadian French. Whereas city life tends to decrease human fecundity, the Italians in American cities have more children than they have in the country. In other words, they have successfully made the adjustment to city life, while the old-line Americans have failed so far to make that adjustment. Our city families are smaller than our rural families.

Photo by Jenks

American-born Italian children, Cleveland, Ohio.

A second noteworthy characteristic of the Italian is *industry*. The Italian migrant, as we have seen, goes from Italy to other countries, not to seek liberty, education or adventure; he goes solely for work. Just as he has taken the place of the Irish immigrant in American construction work, in the building of roads, railways, irrigation, drainage, so he has gone to other European countries, and in the face of millions of unskilled native sons, has done the new construction work—especially the public undertakings. He goes by many thousands into machine industrial employment in the industrialized countries of Europe and the Americas.

In several places in Southern France agriculture is said to be dependent on him. His constant application and industry in cotton and tobacco growing in some of our own southern states have made him highly prized on plantations where he is known. In short, the characterization made of the Italian by the United States Immigration Commission seems to be universally acceptable: "His strength lies in his patience, unflagging industry, and capacity for hard monotonous toil."

Thrift and frugality is a third Italian characteristic. Savings in banks, and the owning of real estate proclaim thrift. In several American cities we find statistics showing that the North Italians are the largest depositors in banks of all our new immigrants, and that the Italians, unspecified as North or South, more largely than any other of the newer immigrant peoples, own their homes. It is the South Italian and not the North who so largely sends his money back to Italy—the one saves and sends to Italy, the other saves and deposits in American banks. But both buy American real estate.

In the days before the war when the average earnings of heads of Italian families in such American industries as the manufacture of shoes, gloves, women's clothing, the dyeing of silk, was less than $800 a year, Italians here annually sent to Italy some $70,000,000 known to and reported by our government agencies. Undoubtedly much also went to Italy in the pockets of returning Italians and in other ways of which the government has no knowledge. Such remittances mean for our Italians more than mere thrift; they mean what we must call "frugality."

From all Italian communities comes the report of merchants that Italians are "stingy." Very well! They are not spendthrifts; they are frugal. South Italians in New Jersey sometimes live on twenty-five cents a week, with Italian bread, macaroni and peppers. On the canning farms of New York the living cost is from fifty cents to a dollar a week. Dr. Antonio Stella says of his own people: "The vaunted remittances of money to their relatives in Italy . . . . almost invariably represents the most humiliating deprivation of the bare necessities of life."

This Italian characteristic of frugality, which is so marked, thus has another side which should grip the attention of all who are interested in Americanization, *because savings often mean that the Italian families live and bring up their children, if they survive, in disgraceful, un-American conditions, crowded, underfed, diseased, with wage-earning women and children.*

In many parts of Italy, due to ignorance and poverty, the standard of living is unbelievably low, with no regard for modern ideas of hygiene and sanitation. These standards are brought to the United States, and where persisted in in Italian large-city communities, produce the slums social workers deplore and almost despair of. Here there is a subversion of all the democratic ideas of the rights of womanhood and childhood. The problem of child labor in America is largely the problem of the children of the foreign-born. Florence Wilkinson has given us a true picture of New York City Italian children flower-makers in her poem, *"The Flower Factory,"* beginning—

"Lisabetta, Marianna, Fiametta, Teresina,
They are winding stems of roses, one by one, one by one—
Little children who have never learned to play."

It is easy, perhaps natural, for those peoples, whose women and children are out-of-door "bread-winners" in Europe, to put them into the wage-earning class in America—which with its unaccustomed indoor confinement here is so deadly. One of the most important practical problems for our nation is to help such immigrant groups to attain more healthful and wholesome standards of living.

But we must note that the industry and thrift of the Italian in America keeps him out of our dependent class. These are virtues from which the public gains, as does the frugal and thrifty person himself. The Italian is rarely a mendicant, and he has small representation in our institutions for dependents.

A fourth characteristic of the Italians is in the realm

(Concluded on page 14)

The Lure of the World's Aerial Theater

Radio Now the Most Popular of American Indoor Recreations

By A. R. PINCI

LIKE everyone else, I have seen a great deal of air. The biggest expanse I beheld at one time was through an observatory telescope, and between the retina and a star regarded as almost invisible my glance pierced more air than is commonly the case, at least as far as air reaches.

As Marconi had just been heard from, air in those days was principally something to breathe, not very safe at that, considering the unpronounceable microorganisms a new school of bacteriologists was beginning to identify. Otherwise at that time air was good for boys to exercise a kite, for women to dry Monday's wash, for many men "to be up in," and the biggest ocular thrill was when a balloon hove in sight. The only audible thrills were still limited to ghostly sounds.

Today all that has changed. The air provides a free theater for much of the world, and it is taken for granted. At least, it is taken for granted in the United States, where radio has made its greatest stride, where it has suddenly become a household necessity. The great American indoor pastime is to go after the things "that are in the air." If the growing army of dialticklers knew that the air contains argon, crypton, metargon and neon—names which sound like some of the performers occasionally advertised—it would at once try to tune them in.

Years ago Pasteur, Muntz, Sestini, Omeliansky, Koch and Metchnikoff, among others, were studiously examining the air for its microscopic life in behalf of health. Today Marconi, De Forest, Hazeltine, Squier, Goulden and others are intent upon making the air more healthful by utilizing it as a universal conductor of virtually free amusement. If at the same time a few hundred thousand quintillion trillions (it's easier to spell than jot down the figures) of microbes are electrocuted by the Hertzian waves, health will be the gainer.

Just now, however, the great problem of radio centers on broadcasting. This phase has been discussed for two years or so now, and those interested are no nearer a solution than when they began arguing.

It is much too late, of course, to erase radio as the latest on the list of the simple luxuries that in this country so swiftly make the transition to necessities. Hospitals have provided it for their patients, its use being permitted upon doctors' orders; many deaf persons are finding it a boon musically; a public subscription in New York to provide disabled veterans with sets reached in a few weeks the sum of $100,000; a Washington newspaper made a success with its "shut-in radio fund," intended to provide sets to invalids and others; and finally, a million persons have invested in radio parts and instruments on the supposition that their purchase was semi-permanent.

In general, the argument is settled on the part of the listeners with the plea that if there had not been any free broadcasting they would not have bought a set, or the parts of one, which is not exactly the same thing, so far as the implication of responsibility goes. But that answer does not answer. The sets which cost $100 or more, the price of a good phonograph, are the minority, experts saying there is one factory-built expensive set to every ten homemade ones.

From an impartial, independent standpoint, one may ask what is the right to claim a free concert on the part of one who has made an investment of $17.32 for parts, possibly not one manufactured by a broadcaster, and entirely apart, whether an investment of $10 or $500 for a set actually entitled purchaser to free broadcasting forever and ever, the manufacturer not covenanting so to do.

This argument, which is now of national proportion, and whose first whispers have already reached Congress, is herein set forth not as a radio analysis, but as a report of interest to the great majority of the people; that is, radio fans.

The Radio Corporation of America, of which General J. G. Harbord is president, has assumed the aggressive for free broadcasting. The American Telephone and Telegraph Company, through H. B. Thayer, its president, takes the opposite viewpoint, both as a matter of record and as a question of principle.

The former company sells sets, although its chief sales item is tubes, and a very few parts. To maintain sales, free broadcasting would be a *quid pro quo* plus an advertisement. The other company, which is the parent company of telephone and telegraph subsidiaries, has no radio to sell, but judging by special wire leasing in distant control work it has profited by this extra service.

Should Broadcasting Be Free?

THE latter company takes an extremely practical business opinion of broadcasting, declaring that free broadcasting is no more natural than free phonograph records, free gasoline and oil, free typewriter paper and ribbons, and the like. It does not contest the right of anyone to broadcast free, but it wishes to go on record, apparently, that unless it is regarded as a distinct advertisement by and of broadcasting companies, it cannot be free, and the fan ought not to be permitted to go on expecting free private service of this kind indefinitely, particularly now that they have become exigent, critical and censorious.

Later this year its experiment with the $100,000 radio fund, made up of popular subscriptions, will be worked out and more can be told when it's all over. The idea is that good artists, good music, good entertainment, cost money, and the very entertainers that radio fans seem to want now are those who do not need advertising. Nearly half of that sum has been subscribed by wealthy donors, just to start the ball rolling, and those initiating the project count on ten-dollar contributions, of which thousands have been received. Briefly, this company wants to discover whether there are in the United States enough fans who will contribute three cents a day for the privilege of tuning in one excellent program, irrespective of the fact that children with homemade sets costing less than ten dollars cannot be expected, and will not contribute, any sum for any program.

Officials of the Radio Corporation of America do not believe that it is practical, as things stand, to make any kind of a charge for broadcasting that the average listener-in will pay. This not because they want something for nothing, but rather because impartiality cannot be enforced. In other words, as fans they do not object to a little philanthropy, since they have been accustomed to it, unsight unseen, but they object to becoming philanthropists.

Dismissing the possibility, as urged by some, that the government—Federal, state and municipal—shall go into broadcasting officially (the city of New York has just opened a costly station) from the viewpoint of welfare, education or other sociological requirement, the argument reduces itself to the very simple one of advertising.

Now, this question of advertising has been bandied back and forth rather carelessly of late. So it is well to explain the difference between advertising for self and being an advertising medium. This means that the fan must choose, to make his views known, between a station that advertises the broadcaster proper, and one that accepts radio advertising at so much for each broadcasting period.

Congress Takes Notice

HERE we come again to the original argument between two nationally known stations, WJZ and WEAF. The former is essentially part and parcel of the advertising fabric of the Radio Corporation of America, although to my knowledge it has never advertised a single product of the company. The other is an experiment in a new communicating medium on the part of a communications company, the American Telephone and Telegraph Company. It is a company rich enough to spend $100,000 yearly for maintenance of its station, if it wishes, and could well charge it to advertising, but it has no such intention. What this company seeks is whether it can rent its broadcasting facilities to those who may find it advantageous to go on the air without the attendant expense of an own station.

Newspapers, department stores, hotels, industrial plants, and churches are the leading broadcasters today. They intend it as a public service, and the way it has been conducted so far it is a public service, but in reality it is an advertisement. Like all other kinds of advertising, it has its dead area, either because it does not reach all the people or because many listeners-in may never have a commercial or other contact with the broadcaster.

A very popular station in the East, not very far from New York City, has never advertised its wares; all the announcer says after calling the letters is "one of America's greatest stores." In the metropolis it made a hit recently through originality by broadcasting at seven o'clock in the morning the "daily dozen" music. Thus, while at seven o'clock in the evening it prepares for slumber the children by hanging out stars for each of them, called by name and located by address, twelve hours afterward it acts as a pleasant alarm clock for fit-as-a-fiddle workers. Its voice has been heard in Japan and France, which is a long breath, halfway across the globe.

A practical advertising man would deride the pulling power of that radio station as a direct merchandise seller, particularly because merchandise is not mentioned. But more people away from the city where WOR is located know the station than there are those who read its ordinary daily advertising. And acquaintanceship never hurts.

If I am not mistaken, the services at St. Paul's Episcopal Cathedral were the first to be broadcast, so WWJ of Detroit scored heavily. But if it was not the very first it was such an important church that its example was soon followed by other churches. The fact that the Pope is now a listener-in is considered by many as precursor of radiocast services from some of Rome's churches.

One of Philadelphia's stations treated its auditors to a broadcast from the bottom of the sea, somewhere off the Steel Pier at Atlantic City. A special outfit had to be devised for the diver's use, who told of his descent fifty feet below the surface. Then he described the wreck of an old boat, which long ago had gone to Davy Jones' locker, the fish that swirled about, and effect of the sun's rays at that depth.

It seems strange that Washington, the seat of the government, where Uncle Sam maintains army and navy radio, the broadcasting work is done by the two private companies there, WCAP and WRC, branches of New York's WEAF and WJZ, respectively. Working alternately, and often being given the right of way throughout the nation from coast to coast, the Washington stations introduce the President of the United States, ex-presidents, and famous visitors, last year's notable examples being Lloyd George and Woodrow Wilson.

Congress has recently sat up and taken notice; it has squabbled under the dome over the desirability of radiocasting its sessions. At this time the situation is this, 51-49, or some such ratio; it is a good thing; it is a bad thing. A roll call to settle it, *a la* national conventions method, is out of the question. It is urged by friends because it would expedite work and keep members constantly present, because constituents could check up on absenteeism and "talkism"; it is objected to by others because it would keep members declaiming indefinitely to prove their indefatigableness. Neither side seems to have thought of the possibility that listeners might have work to do at home.

A prediction is almost safe, however, that Congressional debates will be broadcast sooner or later, and no doubt the entire governmental output of radiocastable information will in due time be represented by a single official station. Its sphere ought to be essentially governmental; its output everything from a speech by the President of the United States to the hog quotations. The big problem—one which has been faced by private broadcasting directors—will be a censorship sufficiently mandatory to check ambitious officials from advertising themselves instead of their duties.

Newspapers have become enthusiastic users of radio; about fifty of them have their own stations in this country and Canada. But it is childish to hold that radio can take the place of the newspaper, even if it were practically possible to tune in on one's favorite news items. The newspaper can be read at one's convenience; it can be read to suit one's moods or interests, and selectivity therefore is at one's command. Radio's output must be caught at the hour it is scheduled, and if something goes wrong with the receiving set, or the auditor misses a few words, effectiveness is lost, because it is not possible to go back if a point is lost.

Hotels are now booming the broadcasting industry. Not many fans east of the Mississippi who can tune in New York but have heard the Waldorf-Astoria concerts, thus giving them a treat that only a few years ago was reserved for the ultra smart set.

Is that advertising? These are the hotels that are mentioned, photographed, and otherwise referred to by the newspapers, because they are a sort of national landmarks. Do they need, as such, advertising? How many prospective guests can any hotel deploy from the ranks of listeners-in? A hotel is not like a store; it cannot increase its number of rooms and other accommodations as a store can add to its stock of goods. Building additions is all very well; filling them is something else.

It is quite likely that in the case of both hotels and theaters the broadcasting is an entertainment chiefly intended for out-of-town listeners, after a certain number of the home-town folks have been catered to. After all, there are many residents of New York who have never been inside of a fashionable hotel and perhaps also of a big theater. In this respect said New Yorker is not a whit better off than the farm-bound youth, but radio serves and equalizes both.

Whether it be a church, a hotel, a theater, a newspaper, a manufacturing plant, its broadcasting service really becomes useful, in a specific sense, in ratio to the number of potential listeners served in addition to and beyond the number that would be directly served were there no radio. That, conclusively, is the final and only measure of radio's beneficial possibilities.

For example, take New York University, which has started a so-called University of the Air, one of many, serving definite localities. One week's curriculum included public affairs, by Professor R. D. Smith; history, by Professor Howard Driggs; philosophy, by Professor Herman Horne; social economy, by Professor H. P. Fairchild, and systematic psychology, by Dean Lowe.

Naturally, a program like that will not appeal to many listeners, not as many as would music or a prize fight or a Presidential speech, but an unseen classroom of 120,000 interested persons—not necessarily all students—which is the number estimated by the university officials, is a big school.

What Fans Are Fond of

COLUMBIA UNIVERSITY held a series of ten lectures dealing with the works of Robert Browning, but a matriculation fee of five dollars was charged, according to an announcement in the newspapers, to pay for the printing of a syllabus which was provided to each student.

Unseverable from the question of broadcasting, particularly in extracting a fee therefor, is *what fans like.* A pleased fan may not be the best customer, but he may have the makings of one.

What do they like best?

That is not the sole question.

What do they like best, even to contribute a little something for it, as against the apparently perpetual competition of free broadcasting?

The Radio Music Fund, started last spring in New York, already referred to, attempted a poll, with the result that WEAF's tabulation shows symphonic music first; jazz, second; instrumental and vocal selections, third, obviously relegating miscellaneous features to last place.

A newspaper poll undertaken a few months ago showed the following vote:

Dance music,	2,527	Current plays,	686
Popular songs,	1,908	Vocal recitals,	539
Instrumental,	1,447	Banquet speeches,	537
Sports,	1,127	Church services,	498
Opera,	850	Bedtime stories,	248
Lectures,	710	Readings,	241

How final this tabulation is, no one knows; at best it is indicative. Yet it tells nothing of how the voters would line up if it were a case of "Eeny, meeny, miny, moe, catch a fan by the toe, but if he hollers against paying a coupla dollars, let him go."

Moreover, there enters the problem of copyrights.

The Acropolis at Athens crowned by the majestic ruins of the Parthenon and other masterpieces of ancient architecture.

Where Grecian Culture Was Enthroned

Pilgrim to Palestine Visits the Haunts of Ancient Civilization

By HAL WALKER

In this part of the wonder voyage the writer gives a vivid impression of Athens and other places in the Near East.

OUT of Valetta Harbor in the early evening, the hour we left nearly every port on the entire trip so we had the most possible daylight ashore, we were heading eastward for the real Near East. As we cleared the bay the lights flashed on and formed a yellow frame for the harbor, where a few steamers were lying at anchor, and outlined the city itself much better than its slopes could be seen under the light of the sun.

Our next stop was to be Piraeus, the port of Athens, which bears the same relation to the ancient city of the Greeks as does San Pedro to Los Angeles. However, Piraeus has a natural harbor and is much nearer the center of Athens, only five miles, than is the California port to the center of the Angel City. From the time of passing between Crete and the Greek peninsula, land was always in sight, islands seeming to dot these waters as thickly as speckles on a turkey's egg. From a glance at the map after passing around and between these myriad isles, I think perhaps even the map makers left out a few.

Coming into Piraeus shortly after the noon hour, I was struck by the number of idle steamers swinging idly at their anchors and becoming more and more thickly coated with rust. In Naples I saw many vessels under the same condition, but thought then it might be wholly an Italian question, whereas it seems to be the same in all ports of the Near East, as I was to find later. The harbor of Piraeus seemed literally filled with these craft which should have been engaged in commerce on these Eastern seas but the disturbed conditions following the Great War and the later exploit of the Greeks in Asia Minor created a stagnation in business. The prolonged fighting of the Greeks with the Turks under Mustapha Kemal, which resulted in the Greeks being driven out of Asia Minor, did much to destroy the business between Greece and the nearby Asiatic coast. Agriculture was crippled and manufacturing almost at a standstill.

As in Naples, there were automobiles awaiting us in Piraeus after we landed from the *Pierre Loti* by small boats. First we were taken around Piraeus and the neighboring harbor, and then headed for Athens itself on a fine macadam road. Athens, in its downtown section, might be any modern city at home except for its sidewalk cafés. Everything else, buildings, paved streets, tramways, automobiles and other necessities of modern civilization, abound.

We think of Athens in terms of pictures we have seen of the Acropolis and ancient architecture, and are genuinely surprised at the modern Athens lying below the slopes of the ancient temples. In this modern Athens many of the inhabitants are occupied as their cousins or other relatives are in the States, running shoe-shining stands, cleaning hats, and running small restaurants.

Only a short time was spent in this modern Athens, nearly our whole afternoon was on the Acropolis which rises 200 feet from the plain below and is crowned by the ruins of those wonderful buildings whose construction and beauty of line have been the motif for many more modern constructions in our own land. Those buildings on the Acropolis, which represent a civilization old before the Christian Era, will be handed down to future generations of our own people by the genius of our own time and will be forever a monument to what we owe the ancients.

My first, and my last, view from the Acropolis over the surrounding country was disappointing. Where I had expected to see, I don't know why, flourishing groves of olives and other fruits, and highly cultivated land, there seemed nothing except barrenness. Huge rocks and long stretches of bare, brown earth parched in the sun, and punctuated only at long intervals by the green of trees, was the general vista. Dust clouds filled the air with every slight wind far out over the plain. The fertility that was Greece's in ancient days has departed.

It was this lack of vegetation and the clouds of dust driven before the breeze that caused my remark to one of the Frenchmen of the party after we were back aboard ship. He asked me what I thought of Athens, and I replied that it seemed mostly dust, referring to the surrounding country. This must have disappointed him greatly and confirmed the view of many foreigners that Americans have no appreciation of beauty in art and architecture, for later he wrote in a French publication: "It is true that the Parthenon leaves some indifferent, like the American who, asked to give his impressions on what he had seen at Athens, gave a resumé in a word, 'there was much dust.'" In case this comes under his eye he will understand the reason for my remark

Modern Athens dominated by the Acropolis.

There is a thrill in the Roman ruins at Nimes, in Southern France, the arena, and the great Ponte de la Garde, bridge and aqueduct combined, there are thrills in some of the Buddist temples in the Orient, in Mohammedan mosques, a supreme thrill in the Church of the Holy Sepulchre in Jerusalem, which latter I experienced later, but the thrill on that afternoon in Athens, standing on the Acropolis and gazing at the Parthenon, was like none of these others.

It was overpowering to gaze upon that ancient architecture, designed by the race which was the mother of western civilization, that pile which for so many centuries has defied the elements and wars alike. But just as the real feeling of awe for the work of those ancient artisans grips one the strongest, one notices ladders and scaffolding with workmen in ordinary American overalls working on restoration, and a hundred or more feet away a shack selling picture post cards and lemonade, so that the jolt back into the present century is rather severe.

The French Mission included, as I explained in telling of the personnel, mostly business and technical men, regular Main-streeters in our vernacular, but they took a stand that afternoon which gave me a new insight into their character, into one of the traits which makes the French nation what it is. We were scheduled to go to a tea, reception or something of that sort, arranged by the French consul general, I think, but these hard-headed business men in whom one would never have expected a trace of sentiment turned the invitation down there on the Acropolis, and for what? To see the sun set from this ancient stronghold of art and literature.

And so we remained as the air grew chill and the sun sank slowly in the west. With the shadows creeping through the valleys around and only the tops of the higher hills in the sunlight, the last beams of the god of day lingered caressingly on the Doric columns of the Parthenon turning them to a rich golden brown so that it seemed for a few moments as if they were pure gold, so richly did they absorb the lingering rays. With this picture stamped indelibly on our minds we slowly walked down to the waiting motor cars, but were silent all the way back to Piraeus, even in the rush of modern transport.

Another time we sailed in the gathering dusk, leaving Athens and its glory behind and bound for our first stop on the Asiatic coast, Smyrna. We seemed almost to dodge islands, so thick are they in the Aegean Sea, those islands which have been made famous by the ancient Greeks in song and story, and in the bright sunlight of another perfect morning we went in through the heads at Smyrna where the Star and Crescent flag was floating from the fortifications. As we dropped anchor in the roads, the Stars and Stripes was seen fluttering in the breeze across the harbor.

Smyrna has a large harbor, but it is without protection and even moderate winds kick up such a sea that landing in small boats is made almost impossible at times, and there are no real wharves in the port. With 500 acres in its business section burned in the great fire which swept the city about the time the last Greeks left in September, 1922, it is a problem as to when this prosperous port of Asia Minor, the gateway to an especially rich hinterland, will regain its commercial supremacy.

The main street along the water front, two-thirds of which was swept by the fire, is faced by modern business blocks and in many respects resembles the Bund of Kobe or Shanghai. There is a dinky street car service, horse-drawn, along the water front and to the suburbs along the bay in either direction, while other means of transportation is a fleet of "deep-sea" hacks drawn by skinny horses which are driven by Turks with much cracking of whips.

Smyrna is a good introduction to the Turk and his history on account of his long domination of the country, but the city itself is cosmopolitan, having quarters for Europeans, Greeks, Turks and Armenians. The Turks have failed in positions of responsibility on the railroad where they were placed at one time by the English manager in response to a special plea of the Turks themselves. Several Turk stationmasters allowed trains to come together and that was the end of the experiment, Greeks thereafter holding such positions. The traders are both Greek and Armenian while the farmers in the interior are nearly all Turks.

I was fortunate in having as fellow travelers on the *Pierre Loti* two men who had lived long in Smyrna. One

Interviewing a Town—Lincoln, Nebraska

Seven Celebrities and What the Inhabitants Thought of Them

By WILLIAM L. STIDGER

I WENT out to interview Lincoln, Nebraska. I have interviewed many men but I thought it would be good sport to interview a town.

Lincoln thinks well of itself.

"Why shouldn't I?" said Lincoln to me when I carelessly suggested to this Middle-West town what I had come from Detroit for the purpose of perpetrating.

"But why do you want to interview me?" said the town with that same camouflage modesty which the average celebrity assumes at the beginning of an interview—and then proceeds to talk his head off.

"Why? Well, there's Willa Cather. That's one reason. Then there's Dorothy Canfield. That's another reason. Then there's John Neihart. Then there's General John Pershing, and William Jennings Bryan, and young Fred Ballard, of "Believe Me, Zantippe" and "Young America" fame, and General Dawes—"

"That's enough. Go on with your interview!" said this young rascal of a Nebraska town with a grin.

No wonder Lincoln thinks well of itself. I doubt if there is another town in America that can call its very own a quartet of such present-day literary celebrities as Willa Cather, Dorothy Canfield, John Neihart and Fred Ballard; to say nothing of General John J. Pershing, William Jennings Bryan, General Dawes and a score of other lesser lights. Count 'em! Seven in all!

I hunted up every aunt, uncle, cousin, girl-friend, boy-lover, cat and dog in town who knew Willa Cather, and they were many.

There was a division of opinion about Miss Cather's books, but everybody was willing to admit that they are interesting and that the most of them are great novels.

As to whether they are true to life, "Some say she is and some say she ain't."

"One of Ours" brings down the wrath of two groups of old-timers who knew Miss Cather when she was in college in the University of Nebraska. One group is the Methodist group and one is the Baptist group. It seemed to be divided along church lines.

The Baptists don't like her picture of the Baptist parson in "One of Ours." They say that she is not fair with him. The Methodist group take exception to her picture of a small Methodist College, claiming that she is picturing Nebraska Wesleyan. It's a merry but a good-natured war that is on.

Dr. W. I. Elmore, who was in school at Nebraska University with Miss Cather, took the matter up publicly and called the roll of great preachers who have gone out from Nebraska Wesleyan to prove that Miss Cather's critical words against the student preachers are not such true indictments after all.

But on the whole, Willa Cather's old neighbors and distant relatives and school girl and boy friends in Lincoln and hereabouts like her and read her and are proud of her. Those who have got into her books are proud of the distinction—and they claim out here that they can trace all of her characters.

The Westerman family is in her books as the Erlings and proud of it. The friends who remain say that her characterization is true to life.

Willa Cather and Dorothy Canfield

ONE of her distant cousins said: "We all love her. She was out to visit us just a few weeks ago and sat and talked old times with us all evening just like she used to. She didn't talk about herself but talked about the neighbors and asked questions about the old folks who had died. She told us about her apartment in New York and her French cook. This cousin remembered Willa as a little girl very much different from the rest of the girls.

"In what way?" I asked.

"Oh, she always had her hair cropped short and she always was a Tomboy and wore stiff, mannish clothes and had lots of fun and stole fruit and—"

"Halt! I want nothing that will impeach Miss Cather's reputation. If she stole fruit let's keep those sordid things in the dark for the present. It would be a shame to ruin her thus early in her literary career."

In college her girl friends remember her as still boyish in dress and appearance. The cropped hair still in evidence and the boyish ways with stiff white collars, and tailored clothes.

One girl school friend said, "Once, when the style was to wear sailor hats, instead of getting a girl's sailor hat Willa got a boy's sailor. I have known her for years and I never have been sure which was the real Willa. But a few months ago when I had tea with her in New York I was surprised to see a great change in her."

"What was the change?" I asked.

"She is wearing her hair longer and she is wearing sweet feminine gowns and she seemed so changed."

They all remember Miss Cather as a remarkably alert, unusual, strikingly individual girl. They are proud of her in her old college town; they read her books and argue about the characters; and they have a distinct sense of ownership and pride in her.

Dorothy Canfield also is claimed by Lincoln.

Miss Canfield came here, so they say, as a vivid, flashing, little black-haired girl when her father became the chancellor of Nebraska University about 1890.

"The first time I ever saw her," said a beautiful Lincoln woman, "was one morning on the campus walking with Lieutenant John Pershing, who was in charge of our cadet batallion in the university. He was in his spanking uniform, straight shouldered, handsome, as he has always been, and, walking along at his side, looking up into his eyes, was this beautiful little, black-haired, vivacious girl, Dorothy Canfield, daughter of the new chancellor. I always did declare that Dorothy was in love with Lieutenant Pershing."

"Did Lieutenant Pershing know it?" I asked.

"I don't know. They used to be about together a good deal but land sakes, Dorothy was only a child then."

"Did she wear bobbed hair?"

"Yes, her hair was bobbed. She was the first girl who ever wore bobbed hair in Lincoln I guess. She had just come from France where she had spent a good deal of her girlhood days. She had beautiful French mixed up with her English. We loved to hear her talk. She had all of the vivacity of the French girl. She was animated and she was—beautiful. We all loved her."

"Yes, I have just read 'Rough Hewn' and nobody could have written that book who had not been steeped in the French atmosphere and life. Curiously enough, too, I read 'Rough Hewn' here in Lincoln where the author spent her early school days," I responded.

But it seems that Dorothy Canfield, too, has run afoul of local pride just as Willa Cather has in stepping on the toes of the Methodists and Baptists.

When she was writing the Red Cross articles she told about General Pershing when he first came to Nebraska and said "He found a crowd of Nebraska clodhoppers to deal with."

This aroused the indignation of a dear old lady in Lincoln and she spoke her mind frankly about such a caricature of local business men.

"The idea!" said this dear old defender of the public pride, "of calling fine men like Will Hardy, and Will Jones clodhoppers! It's a shame!"

General John Pershing

"BUT that's just what we were, all right!" says this same W. E. Hardy, now chairman of the commission that is building Nebraska's new $5,000,000 State House. And Will Jones, editor of the Nebraska *State Journal*, agrees with Hardy that Dorothy Canfield was right; that when Lieutenant Pershing came to Nebraska fresh from West Point all he found was a crowd of clodhoppers.

Dorothy Canfield, who took her prep work in Nebraska and later went with her father to Ohio State, still corresponds with her girl friends here and the translator of Papini's "Life of Christ" and the author of "Rough Hewn" has many proud girl and men friends who remember her as that little bobbed-haired, curly headed, vivacious "square jawed like her father" girl who suddenly dropped in on Lincoln.

John Neihart is Nebraska's own and Lincoln claims him because he is coming to Nebraska University this autumn to be the Professor of Poetry, following the example of Frost at the University of Michigan and Edwin Markham at the University of Syracuse.

Fred Ballard, who has become famous recently for his two plays which have run on Broadway, "Believe Me, Zantippe" and "Young America," Lincoln claims with enthusiasm. They remember him here and he has a host of loyal friends.

General John Pershing came from West Point as a young lieutenant to take charge of the cadet corps in the state university.

After young Pershing had got into the stride of things, Chancellor Canfield called him in and said, "Lieutenant Pershing, the mere job of looking after these cadets will not keep you very busy. Why don't you study law while you're here?"

"I will!" said Pershing with characteristic brevity and decision.

A little later the old chancellor called him in again and said, "You still don't seem to be very busy, Lieutenant Pershing, why don't you teach one or two mathematic classes?"

"I'll do it!" snapped Pershing, and he did.

He and little bobbed-haired Dorothy Canfield were great friends.

One gray-haired business man told me of his experience with Lieutenant Pershing. This young cadet came in one morning and remarked to one of the girls: "The Lieutenant is a little stewed this morning?" Lieutenant Pershing overheard the remark. He taught the class but after the hour was over asked the cadet who had made the remark to remain.

"He gave me the hardest call-down I ever got! He said 'That was a dirty remark to make about any man! No gentleman would do it! I want you to know that I am indignant about it! You may remain in my class but I'll flunk you if I have the slightest chance. If you make your grades, all right. I'll flunk you if I can!'"

"From that day on there was never a class that he didn't call on me! I got it hot and heavy. I sweat blood, but I passed. He was a good sport."

Another citizen of Lincoln told me this story on General Pershing. "One morning he came out to inspect the batallion. It was his custom to come from a certain math class just in time to receive the final salute after the drill. He timed his coming to the minute and never missed it. But that morning when he lifted his hand to receive the salute, instead of tipping the beak of his military cap he found to his amazement that he had grabbed his dicer hat instead of his military cap. He turned around, walked off of the parade ground without finishing the salute. Presently he came back with his military cap on, finished his return salute and dismissed the batallion. The funny thing about it was that nobody cracked a smile. They were afraid to!"

"I had my algebra under Lieutenant Pershing and I danced with him many a time," said a beautiful matron, with a blush of pride.

"Which did you enjoy the better?" I asked.

"Dancing with him. He was—splendid—we girls were all in love with him—but little Dorothy Canfield had him tight, we thought."

"Pershing left Lincoln to go to the Philippines. But he has always looked upon Lincoln as his home. After the terrible fire in San Francisco he sent young Warren here to live with his sister," said one of Lincoln's citizens to me. "When the World War was over General Pershing bought a permanent home here. He visits his sister and Warren twice a year regularly. We're proud of him."

General Dawes is one of Lincoln's prides. He and Pershing met in Lincoln in the days when General Pershing was Lieutenant Pershing. When the war came and he needed a business organizer he called his old Lincoln friend from a Chicago bank. Later President Harding called him to organize the first budget system for the nation.

William Jennings Bryan is an old story. Until recently he called Lincoln his home. It was here that he was notified of his nomination; here that he carried on his campaign; here that he has lived until he sold his farm to go to Florida.

Evolution?

The folks in Nebraska are divided as to Bryan's belated discovery of this now universally accepted scientific theory.

Like Willa Cather's novels, "Some say he will and some say he won't!"

It was in a recent eastern intelligence test—à la Binet—that a college funny paper got up one question which read:

"When was William Jennings Bryan born—and Why?"

I have not discovered in Lincoln when he was born, or why—but I have discovered that he still has a host of admiring friends here who love him as a man, even if they refuse to follow him as either a scientist or a political leader. But for all that, Lincoln is proud of her Bryan, as she is of her General Pershing, as she is of her Willa Cather, her Dorothy Canfield, her John Neihart, her Fred Ballard and her General Dawes.

It's a great town and willing to admit it, as I discovered in my interview.

Lincoln isn't exactly a New England. Neither is she a New York literary center. Nor is she a Chicago, nor a California, but if there is any literary center between the Mississippi River and the Rocky Mountains Lincoln is going to stand up on her "clod-hoppers" and yell for it!

Where Grecian Culture Was Enthroned

Concluded from page 4

was an Englishman who had been pastor of the Dutch Reformed Church in Smyrna for more than forty years, and the other a Levantine whose ancestors were Austrian but who had obtained Portuguese citizenship during the war and who was born in Asia Minor. He was the director of a large exporting company. Both spoke Greek fluently, the Portuguese explaining that all white children have Greek nurses and they learn Greek under these circumstances even before they learn English.

While the country back of Smyrna is rich in natural resources, only little effort has been made to farm it on a large scale with American tractors and other large-scale machinery. The Turk prefers the horse method of farming. The principal products in which America takes an interest are tobacco and licorice; a large amount of each is shipped to the United States each year.

The Turk is a person of contrasts, and even those who have lived with him for years admit they can never fully comprehend the workings of his mind. The Portuguese citizen with whom I discussed the Turk for many days and at considerable length told me a number of interesting incidents of his experience, bringing out one special trait of the farmers.

"Money," said this man, "has a peculiar place in the Turk's scheme of things. For instance, I have traveled much during many years on buying expeditions in the country where all the travel had to be done on horseback, and many, many a time, far from a town, I have put up with the farmer. Never have I been allowed to pay for my lodging or nourishment. I always offer to pay when I leave but the invariable reply is, 'but there is nothing to pay. The food which you ate and the grain given your horse I raised myself, it cost me nothing.' And there is no argument against that.

"However, a year, perhaps two or three years later, a man with whom I have stayed will need some extra capital to buy a horse or something and will come to me in Smyrna and say he needs so many Turkish pounds. This is considered a loan, but he will wait until he gets it, coming back to my office day after day if I am unable to advance the sum when he first calls.

"This country Turk is invariably honest. As an incident of this, a boy eighteen or nineteen years of age came to see me once. I did not know him, but he informed me his father was dead and that he had owed me a certain sum of money for several years. As his father had left no liquid capital to settle this debt, the boy told me he had come to work for me until the money was paid by his services.

"And yet, a boy such as that, honest in paying the debts of his dead father, is just as likely to come to me one day and say, 'I am at peace with God today. I have just killed an Armenian.'

"The Turks have a saying which, literally translated, means, 'The Armenian is an insect created by God to annoy the Turk.'"

J. W. COVERDALE,
Executive Secretary, American Farm Bureau Federation, who prevented Sapiro getting control.

AARON SAPIRO,
Self-appointed apostle of co-operative marketing among farmers, whose activities are manifold.

SAMUEL R. GUARD,
Publicity Director of American Farm Bureau Federation, a constant supporter of Mr. Sapiro.

WALTON PETEET,
Involved in attempt to make Sapiro master of American Farm Bureau Federation.

Sapiro's Dream—An International Wheat Pool

How He Tried and Failed to Control American Farm Bureau Federation

Joseph's Grain-Control Advice to Pharaoh Repeated—With Variations

By ROBERT MORGAN

THIS is a story for those who believe that the self-appointed Jewish "leaders" of American agriculture are honestly working for the benefit of the farmer. It is a story also for those who believe that this group is working, honestly or dishonestly, merely to fill their own pockets. It is a story, last of all, for those who are beginning to see the truth behind the Jewish exploitation of the American farmer—the truth that this whole Kahn-Baruch-Lasker-Rosenwald-Sapiro program is carefully planned to turn over to an organized international interest the entire agricultural industry of this Republic.

This is the story of the effort by Aaron Sapiro to seize control of the American Farm Bureau Federation, take it completely away from the American farmer, clear it of American direction and operation, and use it as machinery by which Jewry could come into power over all the farmers and all the farms of the United States. It [illegible]ves, too, some nine or ten non-[illegible], who worked and voted to give Sapiro mastery of the American Farm Bureau Federation.

It proves that it was the power and the influence of Otto Kahn, New York banker and head of the international Jewish financial power in this country, which put Jewish representatives into the federation.

And this story further shows that one good American, looking through and beyond these plotters, saved the American Farm Bureau Federation from being today absolutely subservient to organized Jewry.

Between the lines one reads the story of the Jewish communistic movement in America, which seeks to make of these United States what it already has made of Russia. It bears out in detail the boast of Aaron Sapiro that he would first nationalize American agriculture, and then internationalize it. It is one of two sister stories, the other being the truth of the attempt of this same group to obtain control and direction of the boys and girls farm clubs of America, thereby bringing under the absolute domination of Jewish influence nearly three-quarters of a million coming men and women of America. This story will be told in all its details later; let us first see the manner in which these clever gentlemen worked their effort to get control of the American farmer:

The American Farm Bureau Federation is an organization intended to promote co-operation among agriculturists in all branches of the industry. It is essentially an American association, formed of Americans, by Americans and for the benefit of Americans. Its cornerstone is co-operation, that kind of co-operation which has been successful among the orange-growers of California, the dairymen of Wisconsin, and other producers.

The American Farm Bureau Federation has the machinery working whereby local, county, state and national co-operation is obtained among the producers of foodstuffs from the soil. With more than one million members, scattered through every state in the Union; with county and state branches functioning well; with state governments, state universities and the national government giving it aid and support, it is today the greatest and most effective farm organization in the world. Agriculture in the United States is a seventy-eight billion dollar business annually. After deducting all farm products consumed on farms, this industry has a gross annual income of approximately twelve billion dollars. It had, in 1920, the last year in which carefully corrected and closely correlated figures are obtainable, a gross income of $10,976,000,000, after taking out all the values of products consumed at home. Of this $7,018,000,000 was paid out for manufactured products; $1,103,000,000 for direct transportation; one billion dollars for interest on mortgages and bank loans, and $663,000,000 for taxes. These figures leave a balance of $1,192,000,000 in the hands of the approximately 31,500,000 farmers in the United States.

Aaron Sapiro plans to use the American Farm Bureau Federation in the formation of an international wheat pool. This has been hinted previously in these columns, but this is the first time Sapiro has admitted it to be his plan. In an interview published recently in the *Farm Journal*, Mr. Sapiro says:

> "The first step will be to get the whole wheat co-operative movement started with the approval of the farmers. We will get them to sign contracts and pool their wheat. Next, they will be incorporated under state laws, and the third step will be to federate the state organizations. In wheat-raising states, where the farm bureau is a dominating factor, such as Ohio, Indiana and Illinois, the campaign will be put on through the farm bureau federation, having the farmers sign the usual five-year contracts, and organizing state pools.
>
> "The remedy" (for the wheat situation) "is to apply to the international wheat trade one of the vital principles which we propose for the domestic trade, pooling, an international wheat pool. . . . The next step will be to establish an international wheat board at Liverpool to handle the crop. The United States, Canada and Australia will be represented on this board, and perhaps Argentina, with other wheat-exporting countries as they are available."

In other words, Mr. Sapiro plans an international Sapiro Plan Co-operative Wheat Marketing Association, which will control the wheat crop of the world, and which, in turn, will be controlled by Mr. Sapiro and his Jewish backers.

Mr. Sapiro's statement is worthy of second, and even third thought.

This is a sum worth going after, worth even the time of the international Jewish bankers, and if these bankers, working behind their "Gentile fronts," could have obtained control of the American Farm Bureau Federation, they would have been in a fair way to get at least a share of this huge annual income.

Altogether aside from this financial side of the affair, yet nevertheless interesting to Mr. Kahn and others, is the factor of control over the activities, political and otherwise, of all the hundreds of thousands of farmers who are members of the Farm Bureau Federation.

With domination of the federation, the imposition of the Sapiro Plan of Co-operative Marketing on every branch of agriculture would have become easy. Without domination of this organization—for which, by the way, the Jews are still fighting—the Sapiro Plan is having a stormy career, as men come to learn more and more that its fundamental economics are unsound, and its methods of operation extravagant and wasteful to the highest degree.

The American Farm Bureau Federation believes that the major problems of present-day agriculture are organization, efficient production, capitalization of farm industry, transportation, and marketing. It believes that successful agriculture can be neither obtained nor maintained without the equal development of all these major elements. It believes, therefore, in co-operation, but in co-operation *of* the farmers, *by* the farmers and *for* the farmers. Its co-operative projects have been in the great majority successful, because it believes, and operates on that belief, that co-operative marketing cannot be successful unless it has membership by commodity, with the commodities united nationally; and that the true test of co-operative marketing is the *kind of service rendered the individual member by the smallest unit of his organization.* The function of the American Farm Bureau Federation, in brief, is to organize this smallest unit, and help it to become an integral, active, successful part of the larger organization.

This is the picture into which the Sapiro "friends" of the American farmer sought to step; this is the great co-operative machine they sought to control. As usual, they endeavored to inject themselves into this organization by the use of others. There is much to be said about the Gentiles who have camouflaged the Jews in this whole scheme for the exploitation of the American farmer. As much of the millions of dollars of losses which the farmers have sustained under the Sapiro Plan of Co-operative Marketing is due to the ignorance, incompetence and downright dishonesty of these Jew-serving Gentiles, as is due to the worthlessness of the plan itself or to the dishonesty of the Jews promoting it. The writer makes no defense of these Gentiles, nor will he in any instance hide them from the same light of truth he is endeavoring to shed on the whole Jewish combination to control American agriculture.

To explain fully the work of the Jewish ring in the American Farm Bureau Federation, it is necessary to tell the story chronologically:

In June, 1920, Aaron Sapiro—in the capacity of an attorney, and not in the rôle of savior of the American farmer—endeavored to open negotiations with J. R. Howard, then president of the American Farm Bureau Federation, looking to his becoming general counsel for the federation. These negotiations were unsuccessful. In less than a month, however, there appeared before the federation one Samuel R. Guard, armed with recommendations from the Illinois Agricultural Association, and with particularly strong recommendations from those members of that association who afterward supported the Sapiro Plan. Mr. Guard had been on the staff of the *Breeders' Gazette*, and this publication also recommended him, promising co-operation with him and with the federation, but signally failing to give that co-operation thereafter.

Mr. Guard, on the strength of these recommendations, was appointed, late in 1920, to the position of publicity director of the American Farm Bureau Federation. There was not at that time any apparent connection between Aaron Sapiro and Sam Guard, yet this appointment was the opening wedge by which it was sought to obtain control of the 1,250,000 farm families who are members of the federation. Mr. Guard is a very radical young man, pro-Jewish in his leanings, and at present a high-salaried employe of Sears, Roebuck & Company, of which Mr. Julius Rosenwald is president.

No sooner did Mr. Guard become publicity director than he started what now clearly appears as a campaign to obtain the support of the federation for Mr. Sapiro and his plans. During the development of the movement for the establishment of the United States Grain Growers, for example, Mr. Guard constantly and consistently supported Mr. Sapiro, who was fighting this organization, with the result that the Sapiro group ultimately was responsible for the failure of the United

Mr. Ford's Page

BRAIN and brawn are inseparable and make up the world's motive power. The hand, no matter how dexterous, would be a useless piece of machinery were it not guided by the intellect. The partnership of mind and matter is one which has existed since the beginning of time and cannot be dissolved. If this dissolution took place we should have labor without utility, and intelligence divorced from toil. The result would be economic chaos. There must be harmony of intention in order to reach the common objective of accomplishment. The buyer of the product of this partnership, himself a worker, is also an essential unit in the scheme, and the disintegration of this trinity would bring disaster. True progress is only possible when mutual effort makes the highways smooth.

IT IS strange that the phrase "working man" is almost always used in its restricted sense, meaning a man who earns his living by some mechanical or manual occupation. But what is in reality a working man? Is he not a man who works? And if he is a man who works is it not equally true that he is a working man whether he works with his hands or with his brains, or both?

In the ordinary course of things, hand and brain must work together to accomplish any results; to divorce one from the other would be like depriving a ship of its navigator and allowing it to run wheresoever it listed. The result would be disaster.

The lack of appreciation of what a working man really is, is responsible for much of the misunderstanding that has retarded industrial progress. Too frequently men have imbibed the notion that mechanical employment is the only form of labor that is necessary for the common good.

An illustration of how futile manual labor would be were it not supplemented by other essential things is found in the vocation of the farmer. The farmer prepares the soil and sows the seed, but all this would be useless were it not for the refreshing rain and the genial sunshine. Even with the most propitious weather conditions the cultivation of the land and the planting of the seed would lead to poor results were it not for judicious selection and proper fertilization.

It is the same in the work of the engineer and builder. A steel girder may be a perfect piece of workmanship, but it takes the guiding hand of the engineer to place it where it belongs in the man's structure of the bridge; a pier or buttress may be a marvel of strength, but it is the architect who decides their position in the building so that it may be strengthened where most required. Both engineer and architect have made a study of these things and their judgment is relied upon.

This is merely the predominance of mind over matter, the existence of a state of things as old as the world. It is said that animals are guided by instinct, and are not endowed with intelligence like human beings; but if they do not attain this higher level they sometimes come surprisingly near it.

Take bees, for example; a lesson may be learned from the economies of the hive. There are the queen bee, the drones, and the workers, each fulfilling a distinct function in the daily life of the hive; but, broadly speaking, they are all workers, none of them could be spared without causing disaster to the colony and bringing about its ultimate extinction.

The worker bees are so called because their function coincides more or less with that of the artisan who has to use his hands, or with that of the toiler in the fields. They are also known as field bees. They fly abroad, collect the nectar, store it in the cells, and mature it until it becomes real honey; but if the queen were to die the whole of the colony would rapidly be transformed into drones, who, although essential in the general scheme of things, are non-producers, and the colony would starve during the winter. The efforts of the workers become worse than useless when the source which supplies the energy has been cut off.

This is but an example of misdirected energy. Work if properly directed is beneficial to all, if misguided becomes useless.

Give a man a spade and tell him to dig a hole and plant a tree. He may dig the hole and plant the tree, but it requires expert knowledge to tell him just what sort of a hole to dig, and the right kind of a tree to plant. He must dig the hole where the soil is suitable for the variety of tree he intends to plant, and if the tree is to be of any commercial value when it comes to maturity, it must be of a species which furnishes good timber.

There is also the danger of using the wrong tools. In addition to his spade the man might be given an axe, and in addition to his planting activities be told to cut down some of the mature trees for timber purposes. If it were not for the intelligence with which he is endowed and which directs him in his actions, there is a danger that he might apply the tools in the wrong way.

It is related that a gang of coolies in an Eastern country were once supplied with wheelbarrows to take away the dirt from an excavation. Now, it so happened that previously the dirt was put into baskets and carried away on their shoulders. The advent of the wheelbarrows completely puzzled them. They had never seen such things before, and to the coolies they were only so many containers in which they were meant to put the dirt instead of putting it in the baskets; but the barrows were too heavy to carry on their shoulders in the usual way; one man took hold of the shafts and another seized the wheel, and between them they lifted it bodily from the ground, with its load, and dumped it just as they had done the baskets.

This is a case of misdirected energy, an instance of the hand working without the brain. In addition to this there is the unskillful use of tools even when applied to their legitimate use, of which numerous instances could be given. The partnership of brain and brawn cannot be dissolved without inviting disaster.

Therefore, the man who uses his brains as well as his hands in the performance of a given task, or the man whose intelligence fits him for the guidance and direction of others in the carrying out of their work, is as much a working man as any of them. He is just as truly a man who works.

And so it is in any profession, whether that of law, medicine, or the ministry; all who perform their duty faithfully are working men in as true a sense as the toiler in the woods, the fields, or the factory. All who are engaged in legitimate labor, be it with the hands or with the brain, are working men; all who are not idle have the right to be included in this designation.

Much of the trouble and turmoil that have upset the world from time to time might have been saved if the proper relation of the intellect to the hand, of the director of a task to its performer, had been fully recognized. There would have been less talk about "capital" and "labor," about the "bosses" and the "workers," about employer and employe. For that matter men who work are all capitalists, all bosses, all employers, if they only fully understood it; all are equally essential to the general welfare.

The man who possesses health, strength and skill is a capitalist; if he can use this health, strength and skill to the best advantage he becomes their master and is therefore a "boss," and if he uses them as a means toward the betterment of his personal welfare and in promoting the happiness of those who depend upon him, he is an employer conscientiously fulfilling his destiny. He is assuming the functions to which he is legitimately entitled, he is taking his proper place in the order of things, he is the captain of his soul, not its slave.

Let every man remember that he is an essential unit in the great scheme of the Creator, that he has a place in the march of the world's progress, that his help is necessary in shaping the things that matter in their proper mold, that the greatest reward that can come to him is the feeling of duty well done. If he has this feeling he can have no regrets, for he has reached the goal of human ambition, he has attained *true success,* he has reached the end of his journey and awaits his reward. He has put in his working day, and the period of rest has come.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The World's Sore Spot

THERE are persistent rumors that all is not well in the Balkan Peninsula. For many years this has been the volcanic region of European politics, ready to break into eruption at any time. Unfortunately the peoples who inhabit this unstable region do not appear to have taken a lesson from the great upheaval of the World War, nor to be satisfied with the readjustment of territory which followed that cataclysm.

There is news that there is persistent raiding on the Macedonian frontier on the part of the Bulgarians, not on the part of Bulgaria as a country, but on the part of a section of the inhabitants, numbering many thousands, in conjunction with a strong force of Macedonian guerillas, who have taken to the mountains along the border.

This, it is said, has alarmed the Greeks and the Jugo-Slavs, who now hold this territory, and Greek and Serbian forces are preparing to take active measures against the aggressors.

It is the old story of neighbors quarreling about their line fences and property rights, and unfortunately there seems to be no one sufficiently competent or sufficiently strong to act as judge in the matter.

There is the League of Nations. Yes, a year or two before the bomb was thrown at Sarajevo there was a good deal heard about the "Concert of Europe," but while the concert was vainly endeavoring to tune up, the direst discord broke out in the Balkans, and the turmoil only ceased when its authors became exhausted.

It was hoped by many that when the readjustment of the map of Europe took place at the close of the Great War, the various kindred races being formed into republics with territory of their own choosing, it would be a guaranty of peace; but this hope seems to be as vain as that which looks for the reconciliation of litigants who after years of quarreling think they have got the worst of the deal when judgment has been given.

To complicate matters, the army of Soviet Russia is said to be feeling the pulse of Turkey in regard to Rumania by means of armies concentrated along the banks of the Dniester and in the Caucasus, and that Bessarabia has become an armed camp where the Jews are being expelled on account of their Bolshevik sympathies.

Altogether it looks as if all the nations of the Balkans and the Near East were going about with chips on their shoulders, and giving still more direct cause for provocation by treading on each other's heels.

It would be a splendid thing for Europe, and for the world at large, if there was an international police force strong enough to seize upon the ringleaders in these disturbances and segregate them on some well-chosen island, where they could quarrel to their heart's content without disturbing the peace of the rest of the world.

But the pity of it is that each nation has its own police force widely differing as to what is right and wrong, controlled by conflicting governments, and directed by widely diverging interests.

There are peace nostrums galore, each one as worthless as the other. There is no recipe for peace although there are innumerable quack remedies. The elixir of life which is to bring about perpetual harmony, the philosopher's stone which is to bring out the pure gold from the dross in man, have yet to be discovered.

One cannot outlaw war any more than one can outlaw cancer. One can only explore every avenue where a remedy is likely to be found and this research, equipped with common sense and guided by sane methods, must continue. The fact that such remedies are being sought is a hopeful sign; but in the meantime all that apparently can be done is to make every effort to arrest the ravages of the disease.

Was It Shakespeare?

A CHALLENGE regarding the "Shakespeare" myth has been issued by Lord Sydenham of Combe and H. Crouch Batchelor, and appears in the August number of the *English Review.* It undoubtedly adds a notable and forceful chapter to the already voluminous pages of the Bacon versus Shakespeare controversy.

"This great myth," says the article, "is unique in the long and painful history of human credulity, because there is not a shade of valid evidence to connect the man from Stratford with the authorship of his immortal plays."

It is then pointed out that after the appearance of the two narrative poems, *Venus and Adonis* and *Lucrece,* the name "William Shakespeare" began to be attached to certain plays successively published as quartos; but these plays had been acted, for several years in some cases, before they were published, and nineteen of them, including *Richard II, Romeo and Juliet,* and *Richard III,* appeared anonymously. *Love's Labor Lost,* the most learned of all the plays, was acted in 1592, and is pronounced by competent authorities to have been written in 1588, three years after "the actor" left Stratford.

"It is absolutely inconceivable that this person could have composed a play of which the scene is laid in the court of Henry IV at Navarre, and which gives the names of the actual courtiers of the day and even supplies precise details of the payment of a sum as compensation for this monarch's claim on Acquitaine. On the other hand, Anthony Bacon lived three years at the Court of Navarre, and his brother Francis visited him there."

Among other striking evidence in support of their contention the writers mention that some years before the appearance of the First Folio of "Shakespeare's" plays, in a letter to his constant correspondent and intimate friend, Sir Tobie Matthew, Bacon wrote "this revealing sentence":

> I will return you Weight for Weight but "Measure for Measure". . . . of this, when you were here, I showed you some model, at what time methought you were more willing to hear "Julius Caesar" commended.

"Now, *Julius Caesar* appeared for the first time in the Folio of 1623, and it is impossible that the actor from Stratford could have written it."

In summing up the situation the article points out that the appearance of the "Shakespeare" plays exactly fits the known circumstances of Bacon's life. For many years, during which they were coming out, he was living at Gray's Inn working hard at something which his biographer could not fathom. It is pointed out that if Bacon had been known to have written the plays, he could never have become Lord Chancellor.

The *Merchant of Venice* was written when he was living in seclusion at Twickenham, having recently escaped from the clutches of a "hard Jew" with the assistance of his devoted brother Anthony. Antonio appears as the chivalrous surety in the play, and the name Antonio is repeated in the plays, where many characters bear those of Bacon's friends and associates, of whom the actor could never have heard.

In many respects the evidence now brought forward in support of the Baconian theory regarding the authorship of the plays hitherto attributed to "Shakespeare" is the most powerful and convincing yet produced, and were a jury of the most eminent literary authorities of the present day to be empaneled, there is very good reason for supposing that the verdict would go to the learned and philosophic Lord Chancellor.

One cannot get away from the circumstance that there is very little that is authentic known about the life of the actor of Stratford, and what is known is directly antagonistic to the theory that he was a literary genius, or that he even possessed enough learning to place him in the ranks of the balladmongers or cheap pamphleteers of the period. It is admitted that he was a plagiarist; was he also a smoke screen to hide the activities of the erudite Bacon?

What Is Liberty?

"GOVERNMENT of the people, for the people, by the people," apparently does not enter into the political ethics of Signor Mussolini. "Liberty," he laid down last year, "is not an end; it is a means. As a means it should be controlled and dominated." The truth or otherwise of this dictum of Signor Mussolini entirely depends upon what he means by "liberty." Liberty to some people means the right to do what they please irrespective of the rights of other people. This is the definition of liberty which appeals to the bootlegger, the burglar, and the Bolshevik, but it is not the form of liberty which will ever retain its hold on the friends of civilization and progress.

The abuse of liberty, it has been said, is far worse than no liberty at all. Some people have had more liberty than they ever bargained for; for example, the bourgeoisie of Russia. For them liberty has meant spoliation and persecution. The great mass of the people of Russia are weary of this kind of liberty; they have had an orgy of it; it has left them weakened and impoverished by its intoxicating effects. They lie in the gutter of wrecked prosperity without sufficient energy to rise.

It was to save Italy from liberty of this description that Mussolini founded the Fascisti. He succeeded. A wavering administration was succeeded by a firm and uncompromising dictatorship. Kerenski tried to do the same thing for Russia at the end of the Czarist regime, but failed because he was not such a strong man as the Italian. But there are those in Italy who are beginning to think that in abandoning constitutional government for a dictatorship they have raised up a political Frankenstein about the future actions of whom there hovers a mist of uncertainty. This has engendered a feeling of insecurity which is bound sooner or later to culminate in a revulsion of public feeling.

According to a large section of the European press, Italy is tottering on the verge of another upheaval. The kidnapping and murder of Signor Matteoti, a leading Socialist, has stirred Italy to her depths. There is nothing to connect Signor Mussolini with this outrage, although the whole affair is being used as a weapon by his enemies. The fact of the matter is that dictatorships are not and never were successful beyond a certain limit. At critical periods in the history of nations, a "strong man" as dictator has been "the savior of his country," but this has not and never will give him the right to impose his will on the people for an indefinite period. Napoleon made a very successful dictator—for a time—and rescued France from the wreckage of the Revolution, but the dictatorship of Napoleon was backed up by a powerful military organization which dominated not only France but the whole of Europe. A dictator must have the country behind him if he is to continue in power, and this Mussolini evidently has not.

Mussolini has also laid down in his political economy that all governments create discontent, and that the only way to prevent this discontent from spreading and becoming a menace to the state is to employ force. In this Mussolini is undoubtedly right: but would it not be well for all apostles of liberty to note just where he is right. One party shouts for liberty and becomes a menace to the state, therefore force must be employed to suppress it. Liberty and force have never been far apart and they are conflicting elements. This conflict will continue until the time comes for the realization of what true liberty means.

It is the desire that justice may be the portion of all that makes for true liberty. Mussolini is only partly right in his definition of the function of liberty. Liberty is not alone the means to an end; it is both the means and the end.

Municipal Finance

AN ADVERTISEMENT of the latest bond issue of Norfolk, Virginia, gives the net bonded debt as $28,121,848, which is more than 14.4 per cent of the assessed valuation for 1923, $194,723,925. The population in 1920 was 115,777.

The so-called seven per cent rule of New York State, the criterion for municipal financing, limits the investments of savings banks and some other supervised institutions to bonds issued not in excess of seven per cent of the city's assessed valuation.

Seven per cent is high enough in all conscience. It is refreshing to compare Indianapolis, whose bonded debt is but about one per cent, to Norfolk whose commitments are more than twice the usual limit of seven per cent.

A perusal of Poor Richard's Almanac would be more helpful to those responsible for Norfolk's distended debt than chronic visits to bankers eager to profit from commissions upon this business.

Stream of Patients Flows to Orientals

Wily "Herbalists" Reap Rich Harvest by the Sale of Weird Nostrums

By JOHN SLOAN

The dark and subtle methods of the Chinese quack doctors are further elucidated in Mr. Sloan's second article.

FROM evidence produced at trials of scores of Chinese "doctors" in various states of the Union, it is estimated that an average of eight persons place their health, and often their lives, in the hands of each of these so-called "physicians" every day in the year. There are approximately 2,000 of these Oriental medicine men in the United States, and their offices are open 365 days in the year, Christian Sundays, holidays or other vacations meaning nothing to them. A calculation based on these figures, which are under rather than over stated, shows that 5,840,000, nearly six million, white men and women call upon these fellows for medical attention every twelve months. Of these it is calculated by state and Federal authorities that three out of five "patients" visit the offices of the Chinese "herbalists," and the other two take treatment by mail, without ever seeing the "physician" who is treating them.

A few years ago, many of the newspapers of this country trembled with editorial fear of the "yellow peril," every time the tide rose on the Pacific Ocean. Today these same newspapers rush to get and publish the advertising and faked publicity of a real "yellow peril" already well grafted into our American cities, with a deluded following of nearly five per cent of the population of this land. There is one hundred times more actual menace to the American people today in the work of these 2,000 ignorant, unsanitary, careless, and often criminal Orientals in this country, than there is in all the yellow armies now enlisting, or in all the yellow fleets now building, on the other side of the Pacific.

In a preceding article, the writer has shown that the Chinese "doctors," "herbalists," "medicators," "herb experts," "herb specialists," or whatever they may call themselves, are open to indictment on the following counts:

Ignorance of anatomy and of medicine.

Frequent criminal practice.

Distribution of forbidden drugs.

Deception of sick humanity.

Interior of a Chinese drug store where everything in the form of "medicine" from ground-up lion's toenails to pulverized butterfly wings is sold.

These four charges are substantiated by the records of scores of state medical boards, by those of Federal narcotic squads, and of municipal police. These Chinese medicine men are operating every day in the year in violation of the laws of practically every state in which they maintain offices, and the writer has yet to find a state in which they do not operate. Outside the United States they are particularly abundant and active. In London there probably are more Chinese medical quacks than in any other city in the world. Within the past two years, they have begun an organized invasion of the larger cities of Latin-America, notably Buenos Aires, Rio de Janeiro and Mexico City. Doubtless in those countries, as in the United States, the operations of these Orientals are in violation of the national and state and city laws.

How, then, do these "physicians," unlicensed by any city, county, state or nation, escape the results of their activities? How do they evade the law?

It has been said that "every time a new law is made, a crook is born who is sharp enough to break it." The Chinese "doctor" protects himself from the medical laws of this country by six well-chosen pieces of technical armor:

First, he never *writes* the title "Doctor" in connection with his own name.

Second, he never gives a written diagnosis.

Third, he works in trios, as was described in the previous article, making identification almost impossible.

Fourth, he spends money freely where it will make him the strongest friends, politically and officially.

Fifth, he never permits his "medicines" to leave his offices, except in the stomachs of his "patients."

Sixth, the majority of the victims of his criminal operations die; those to whom he distributes narcotics will not reveal the source of their forbidden drugs; and the sick who have been bilked into taking his "treatments" rarely expose their own gullibility.

Out of the third of these factors of protection—the impossibility of establishing the identity of these Oriental fakers—comes another important aid to them in escaping the law, and that is the ease with which any individual one of them can lose himself in the Chinese colony of another city than the one in which he is wanted. Time after time, when convictions have been obtained by state medical boards, the convicted man has paid his fine, exchanged offices with another man of the same kind in another city, and resumed business under another name, with no "second conviction" shadow hanging over him.

The so-called medicines put out by these operators and by the almost equally guilty Chinese drug stores, escape the pure food and drug law by that same loophole through which so many worthless medicaments have before escaped. This law protects the customer against false statements on the label regarding the *composition of the contents* of the package; it does not protect him against falsehoods, printed on the label or elsewhere, concerning the *curative value* of the preparation. I can make pink lemonade with salt water, label it "Morgan's Malaria Master," state on the label that the mess will cure malaria without fail, and get away with it, so long as I state on the same label the exact components of that lemonade.

The Chinese "doctor," in the few instances in which he does sell his "medicines" by the package, states on each the composition of the contents. As long as there is no active poison in the mess, and the patient wants to take it, there is nothing between the dope and his stomach except the patient's own power to swallow. In the majority of cases, in which the Oriental medicine man keeps his dried reptiles, chopped hair, squashed bugs and dehydrated vegetation in his own office, he maintains a label on each package, telling what that package contains, or is supposed to contain. Since, as I have shown previously, it is almost impossible to identify mixed plant and animal products, it is likewise impossible to dispute legally or chemically the word of the Chinese "doctor" or druggist.

Thus, with the question of Chinese medicines gone, largely down the throats of some six million Americans every year, let us turn for a moment to the six methods by which the Oriental "herbalist" escapes American law, drops the bars of medical jurisprudence in the United States and wanders, a veritable two-legged wolf, at will among the unprotected people of this country. He obtains and maintains his reputation as being entitled to the title of "doctor," first by insinuation in his advertising, and second by persistent word of mouth among his patients. Yet he never uses the prefix "Dr." attached to his own name, or to the name of the imaginary person under whom he operates. If a man could be caught using the title of "Doctor," identified as the individual using it, further identified as the person who actually made the diagnosis and administered the treatment, he might be brought into court on a charge of fraudulently impersonating a physician and of practicing medicine without a license. If, when the impostor was so landed in court, his political defenses could be so overcome that his "influence" could be combated successfully, he might be convicted, provided further, that a jury could be obtained which would understand the efforts being made by state medical boards to save our people from swindlers in the field of medicine.

But, as has been said, the Chinese "doctor," though he obtains all the benefits of the title, never puts himself down definitely as a doctor. Second, he never puts a prescription in permanent form, if he can help it, and under no conditions does he permit the patient to get possession of such a prescription, even when written. Chinese drug stores give no copies of prescriptions turned in to them, and they cannot—or at least have not—been compelled to have their prescriptions written in English or in Latin. The third factor, that of confused identity, has been discussed, and it has been responsible for the failure of more cases against these medicine men in American courts than anything else.

There is a sort of brotherhood between these Oriental fakers, both those employed in the branches of the larger organizations and those operating independently, whereby the poorest of them is able to obtain all needful funds for advertising, for contributions to political campaigns among white men, and for the buying of witnesses. In at least three counties in one western state, it is almost impossible to obtain a conviction of a Chinese "doctor" unless the case can be carried into the Federal courts of these districts. It is interesting to note that, in each of these counties, a wealthy Chinese "herbalist," who operates in all three of them, contributes from $3,000 to $5,000 to the campaign fund of a certain official seeking the same post in each county. It is also interesting that, in each of these counties, all the newspapers carry heavy advertising of these Orientals, paid for at rates from twenty-five to fifty per cent higher than other advertisers pay for space on the same pages on which the advertisements of the "herbalists" appear.

The writer has endeavored previously to explain the difficulty of making either qualitative or quantitative analysis of the contents of the packages these fakers sell as medicines. Moreover, it is virtually impossible, today, to obtain such medicines, except by seizure under search warrant from the shelves of the "doctor." When the packages are obtained in such manner, it is difficult to convince the average jury that they are sold as medications to white men and women. The attitude of most juries in these cases is that it is no concern of theirs if the Chinese "doctor" sells this worthless stuff to the Chinese, and that the jurors are interested only in what is sold to whites. The Chinese takes advantage of this, and insists that he sells his medicines only to his own countrymen. There the case sags.

An example of the same thought is shown in the most commonly used "leader" in the advertising of these impostors. It reads:

"Did you ever see a sick Chinaman?"

"No, because all Chinamen take Chinese remedies."

As a matter of fact, few, if any, Chinese patronize these quacks; they have learned to prefer their own physicians and surgeons who have been properly and adequately trained in American medical schools and hospitals, of whom mention was made in the first of these articles. It is the white American men and women who support these Oriental fakers, and who put their lives in the hands of these Chinese coolies who have declared themselves to be "doctors."

Some of these self-styled physicians, one of the most successful of whom today was an errand boy for a brothel in San Francisco's tenderloin before the Eighteenth Amendment took effect, have a code of passwords, by which they identify patients, and without which they will not permit them to enter the inner offices of the "doctors." Some of these, and their meanings in English, taken from lists collected by investigators of the board of medical examiners of a state heavily infested with these swindlers, are as follows:

"Li yuen"—first-grade opium, equivalent to saying that the patient has money and is good for first-grade medicine.

"Yen pox"—opium pills cooked twice to take by mouth.

"Pin yen"—ordinary opium, indicating that the patient is not wealthy and should be given only third-grade medicine.

"Yen shee"—smoked opium, informing the "doctor" that this patient is a "wise bird" and may have anything he or she wants, particularly referring to narcotics.

"Hi moon"—open the door, indicating that the patient has been investigated and found safe for admission.

"Yen she Qay"—the speaker is a drug addict.

From packages of "medicine" obtained from the offices of several of these "herbalists" investigators have learned the names for the various grades of medicines, given, as previously stated, to patients, according to the ability of the latter to pay. A few of these are:

"Yen Loo," number one medicine; "Gee Loo," number two; "Slum Goy," number three; "Slee Goy," number four; "Ng Goy," number five; "Look Goy," number six; "Tit Goy," number seven, and so on up to fifteen.

At first, the investigators were puzzled, believing, from what interpreters had testified in court, that there were only three grades of these concoctions. It was developed, after some investigation, however, that all these grades referred to the diseases which the medicines are to cure, one number for each package for each disease. Thus, all the preparation needed to become a full-fledged Chinese "herbalist" is to learn the fifteen numbers, and the drugs and diseases to which they refer.

(*Concluded on page 15*)

Undergraduate Training—What Is Wrong?

Not Getting Best Results Although Program Is Comparatively Easy

By CHARLES R. BAGLEY

THERE is widespread dissatisfaction in educational circles with the undergraduate work of colleges and universities. It would be extremely difficult to find a college or university instructor who would not shake his head dubiously when asked if the majority of the graduating class were trained men and women. The more progressive institutions are already introducing radical reforms, and educators throughout the country are discussing plans for giving better training to the youth of the land.

The truth is that we are not getting the best results. Although our program is comparatively easy, we fail to make the most of it. The fact that our curriculum is low in comparison with that of the English or French colleges is not the gravest defect in our system. Both of these nations do in the high school work which we complete only at the end of the sophomore year in college, and their high school graduates are very little, if any, older than ours.

A young student from Paris, having had a little work beyond that shown by his high school diploma (*baccalauréat*), came to this country on a scholarship and completed the work for an A. B. degree at an A-grade college in one year's time. The English university college also is about two years higher than ours in the matter of curriculum. Most of the Rhodes scholars who go from the United States to Oxford have the A. B. degree, but they add two years of serious study to take the Oxford A. B. degree in the Honors course. This shows an unnecessary loss of time somewhere in the earlier stages of our training, due largely to the fact that out of a group of 1,000 young people, sixteen to twenty years old, America sends more than three times as many to college as compared with England and France. In Europe, in general, college education has been for the very select few who could pay for it.

The worst feature of our college work, the inexcusable feature which must be remedied, is that it does not train students to think. Whatever else different advocates may set as the goal of a liberal education, all agree that it should give the student a background of knowledge and train his mind to organize this knowledge and from it and subsequent knowledge to be able to produce new ideas, ideas of his own. It is in the second half of this fundamental requirement that our system breaks down for the majority of cases. Only too often we develop the memory at the expense of the natural intelligence. This statement is made only after careful consideration and comparisons, based upon five years' experience as a student in two colleges of the United States, one year in the universities of France, and three years in Oxford University, England, plus several years' experience as an instructor in high school, college and university.

Placing the Trouble

WHEN I entered Oxford University with the A. B. degree from an A-class American college, I found to my amazement and dismay that I was no better prepared for serious study than the high school graduates coming up from the English so-called "public schools," the great preparatory schools like Rugby. I realized then, for the first time, that my college training had not been thorough; I did not know how to think clearly or logically; and, worst of all, I did not know how to organize and use what facts I had retained from my earlier training—all these gaps in spite of the fact that I had averaged 94.8 during five years of college work back home. I possessed an enormous number of facts in bulk, but I was distressingly weak on original deductions and on well substantiated opinions of my own. This, I realize, is a severe indictment of our undergraduate system, but it is nevertheless true for our average college or university. Scores of Rhodes scholars from various states in the Union could testify to similar experience.

The enormous increase in numbers of college students from year to year has served only to aggravate these weaknesses of our system. It is high time to diagnose the trouble and to take steps toward something better. Unless something is done to remedy this old situation and also something more done to solve the new problems which the rapid increase in numbers has brought, our graduates will become more and more the innocent victims of a machine-like system which leaves them with little beyond the useless and empty title of bachelor of arts.

The graduate work in American universities is generally highly satisfactory. In our best universities the graduate work is as good or better than that of any other country. This success in the main has been due to the very features which distinguish it from undergraduate work, namely: comparatively small numbers of students who work individually, with original thinking and careful expression on the part of the students, and with frequent personal contact between students and their instructors.

The poor undergraduate work in college, where it exists, is traceable to three main causes: lack of thorough training in the high school; the large percentage of increase in numbers of students going to college, and the lack of supervision of the elementary courses, particularly those taken by students in the freshman year. From the standpoint of the college, the first two are external causes for which the college is not directly responsible, although it may protect itself against them somewhat by entrance requirements. The third cause is purely a problem for the college, a case of internal reform. It is with this supervision and direction of freshman courses that recent reforms are largely concerned.

Whenever the college accuses the high school of poor training, the latter retaliates by saying that it is the fault of the college for laying down hard and fast requirements. Whether or not this be true, the fact remains that a large percentage of the high school graduates entering college are very poorly prepared to follow the college courses. It is quite natural that the college at present requires preparation in some subjects which do not afford a primary interest for the high school student, as some students have no primary interest in any kind of study. However, practically any subject may be made into a live thing by a real teacher.

With the present almost inevitably low standard of the high school it is imperative for the colleges to require further general training. Public high schools very frequently send to college students who have not been well prepared in anything. This is unquestionably a handicap to the college as well as to the student himself, a handicap which often proves too great to overcome. Better high school teachers are urgently needed, particularly more men who will make of teaching a life work.

Suggested Remedies

THE increase in numbers of students out of proportion to the college facilities for accepting them is the fault of no one; it is a natural condition which must be dealt with. There are only two ways of treating this problem in the right manner. Either the institutions must increase their facilities fast enough to keep pace with the rapidly increasing student bodies, or else the number of students accepted for training should be restricted to a total which may be cared for by the more slowly growing facilities. The state universities must adopt the first alternative; private institutions ought to adopt the second. The trouble with the first plan is that the institutions which are growing rapidly increase the number of students first and prepare for them afterward. This leaves them always at least one year behind in equipment. In some of the largest universities today the sections are so large and so numerous that lower classmen get little more than mass training, and that very often from upper classmen who have been appointed temporary instructors. The larger the institution, the greater the tendency to handle the students *en masse*. A few of the private institutions are beginning to restrict their numbers to a workable total, but many of them still prefer to train a thousand poorly when they could really educate about five hundred. Notably Stanford and Vassar have limited their numbers and admit only the students who show the highest scholastic achievement.

Of course, many will rise up to say that it isn't democratic to restrict the number of students. *Intelligence isn't democratic either.* Since it is neither possible nor advisable to give a college education to all, it should be given to those who will profit most by the training. In this way real leaders will be developed to serve mankind.

So far, no infallible method has been found to determine who shall go to college. It is going to be very difficult, if not impossible, to find a method which does not fail now and then; but this is no reason why we should not try to find a working basis for selecting from the applicants a certain number who have the greatest possibilities for leadership and are capable of the highest development. A perfected intelligence test, a certified record of the student's studies and other activities throughout his high school course, a statement as to the circumstances under which he has worked, and a statement as to his qualities of character, such as ambition, industry, perseverance; this combination would probably reveal the caliber of the applicants far better than the present system of entrance examinations or the fifteen units of required work. Many colleges and universities are making changes along these lines in entrance requirements. In doubtful cases, all of these records might be supplemented by a personal interview before a committee of selection. A method of this sort would be of great service also in helping those with special endowments to find their way into special training. This is a very important matter, and the solution of it will affect undergraduate training greatly. *It is impossible to educate students in crowded classes by the lecture-quiz plan.* The future of first-class undergraduate training lies with those colleges which, first of all, are content to keep within reasonable bounds as to numbers.

An Inequitable Plan

WHILE the college may be the unfortunate victim of circumstances in the case of the student's poor preparation and the inordinate growth in numbers of students, it has no one but itself to blame for the present organization of college work.

Partly from stress of numbers and partly from a mistaken idea of efficiency in education, undergraduate work in our colleges has frequently been conducted on the wholesale plan. Large numbers of students of varying ability and preparation have been grouped together in the same class and have been given the same amount of work to do. This arrangement requires fewer instructors and enables colleges to carry larger student bodies, but it also gives rise to two of the worst features in our system.

When a class contains more than thirty students, or even more than twenty-five, it is very difficult for the instructor to have all of the students recite every day. The result is that some teachers get around the class once during the hour; others get a recitation from the entire class once every two or three meetings, while a good many go whole terms without recitations from all. A few despair of getting discussion from so great a number and gradually fall into the lecture-quiz plan. In the face of the generally accepted theory that a student gets no *im*pression without *ex*pression, our system has gradually, almost unconsciously, gravitated into one of *instruction* rather than *education*. Students need both expression and discussion. The present process is often largely one of memory, requiring very little thinking on the part of the student. Very little, or nothing, is done to stimulate initiative in the individual, to teach him how to weigh the ideas of others, or how to evolve ideas of his own. In short, the tendency is to "build in" (instruct) on him the ideas of others, instead of "drawing out" (educating) his own ideas and developing his natural intelligence. Initiative needs to be developed as far as possible, but today many attend college who have little native capacity upon which to build.

The second evil resulting from a large ungraded class is perhaps worse than the one I have just mentioned. First, second, third and even fourth class students, with different degrees of ability and preparation, all have the same work to do and are handled together in the same recitation. The progress of the class cannot be adjusted to suit the best students because this would swamp the lower half. Neither can it be regulated on the third-class students, as this would leave the upper portion unemployed. As a last resort, the poor instructor bases the class work on the ability of the average student and soon has the unpleasant realization that while about one-half of the class is well cared for, the lower fourth is dragging along and the upper fourth is marking time. Such organization tends to level the class. Instructors often leave the first-class students to shift for themselves just because they can, while they spend their time trying to get the lower part of the class up to the average. By so doing a golden opportunity is lost for making real students and well trained men out of those who are both capable and ambitious. If the main object be to get all up to the average, then the good students ought to be stopped when they finish high school and only the unintelligent ones sent on to college for further training.

The most just adverse criticism of our undergraduate organization is that it makes no provision for exceptional students to get maximum development. In the larger colleges, it should be added, some attempts are now being made to distribute the students in sections according to their preparation and ability as shown by "intelligence tests." In this way every student gets the type of work he needs.

Must Educate Themselves

IN THE work done there is a noticeable lack of thoroughness, which is due in a large measure to our system of credits. A student is promoted and graduated on the basis of the number of courses he has taken and "passed off," not on a basis of what he knows about the subjects taught in college. The process of graduation tends to be more quantitative than qualitative. After studying a subject for a few months and passing the examination, a student may put the whole thing out of his mind at will, except in so far as this subject is continued in another course. Thus, by an accumulation of credits a student may graduate without attaining real mastery of any field. Our standard for graduation ought to be: "What do you know in chemistry? or in mathematics? or in history? and how well do you know it?" and not merely: "What courses have you had?" Fortunately new examinations along this line are being attempted at Harvard, at Columbia, at Michigan and in many other colleges.

Education is primarily a social affair. Instruction may come from books and lectures, but a liberal education comes only when instruction has been supplemented by the additional factor of personal contact and the resulting opportunity for self-expression. This is proved by the fact that the college men who make the most useful citizens in after life are usually those who were leaders in college activities rather than those who simply made good grades.

In our present system of undergraduate training there is far too little personal contact between instructor and student. There is no provision for promoting informal associations between the professors and their students, and as far as I know the idea is not even generally approved. In the undergraduate work at Oxford University, where a large part of England's greatest men have been trained, students and teachers are constantly thrown together informally in games, at afternoon teas, in various clubs, and even in the individual meeting during tutorial hour. Nothing is more inspiring to a young student than the influence of a human, sociable instructor who isn't afraid to play games with the members of his class or too much impressed with his own dignity to take part in their clubs and other activities. These associations, however, must be judicious and in the spirit of student to student to encourage and not repress expression from the younger men. College instructors must "work with" students instead of trying to "work on" them. After all, students must educate themselves; teachers can only offer inspiration and direction. Herein lies the work of a real teacher.

College is not a factory where masses of raw boy material are made into new beings. The spreading of intelligence and the general perfection of the human race is the big problem of eugenics and not of education. The main function of the college and its greatest service lies in training that small but important minority who have within them the germs of intelligent leadership, that there may be enough clear thinking in the world to leaven the mass of groping humanity.

Over the Goodnight and Loving Trail in 1867

Romance and Adventure of Cattle Driving From Texas in the Old Days

By ANNIE DYER NUNN

IT WAS a strange funeral procession, that which followed the Goodnight and Loving trail in 1867 from Fort Sumner, New Mexico, to Weatherford, Texas, a distance of 700 miles. Oliver Loving, the first to find an outlet for Texas cattle, had made his last long drive; and the western frontier with its trackless wildernesses and featureless wastes of prairie would know him no more.

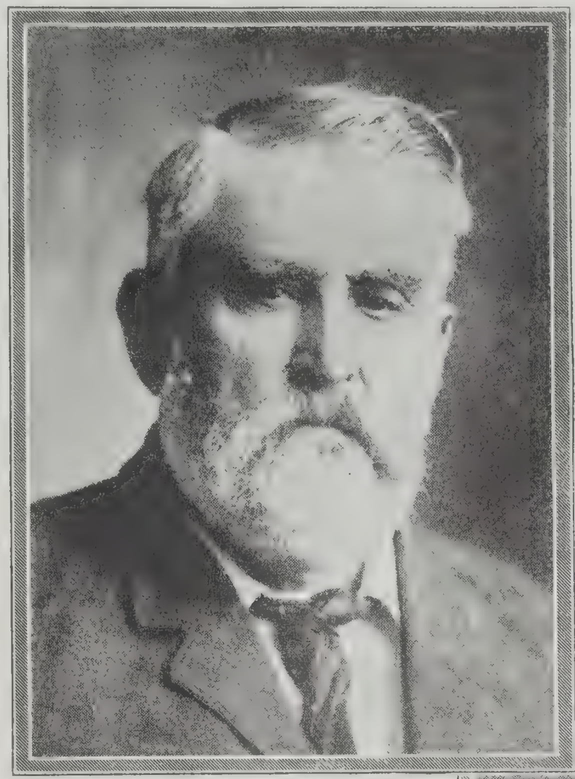
The casket, in which lay the remains of this great pioneer, was carried in a wagon drawn by a mule team. Nine cowboys on horseback rode in front of the wagon and nine behind; these were followed by the chuck wagon and remuda. This escort was the Goodnight and Loving outfit which had delivered 2,500 head of steers into Colorado and now were homeward bound. The sad journey was singularly peaceful; not an Indian was seen during the whole time.

The first trail over which Texas cattle were driven to northern markets was blazed by Mr. Loving in 1859. Beginning in Palo Pinto County, Texas, it extended through the western cross timbers, on through Northwestern Texas and into Colorado as far as Denver.

During the Civil War, Mr. Loving ceased to drive his cattle north, but resumed in 1866. His cattle, during the war, were sold to the Confederates, but they never paid the $150,000 due to him.

In regard to conditions at the close of the Civil War, Emerson Hough says:

"The Civil War stopped almost all plans to market the range cattle, and the close of the war found the vast grazing lands of Texas fairly covered with millions of cattle which had no actual value. They were sorted and branded and herded after a fashion, but neither they nor their increase could be converted into anything but more cattle. The demand for a market became imperative."



Colonel Charles Goodnight, the only one now living of the eighteen men who were in the drive of 1867.

In 1866 Charlie Goodnight, afterward one of the leading cow men of Texas, finding himself with plenty of cattle but no money, determined to push out to northern markets. Oliver Loving declared the project impossible. The Comanches and Kiawas, fierce nomadic tribes, were prowling through the western country. Loving pointed out that no trail herd could escape them. Of this Goodnight failed to be convinced, and in the end Loving decided to go with him, taking a herd of his own.

In New Mexico and Colorado there were no cattle. A man was fortunate to be able to rent a milch cow for $5 a month. At Fort Sumner, New Mexico, the government was feeding 9,000 Navaho and Apache Indians. Beef was needed. Goodnight and Loving proposed to supply it.

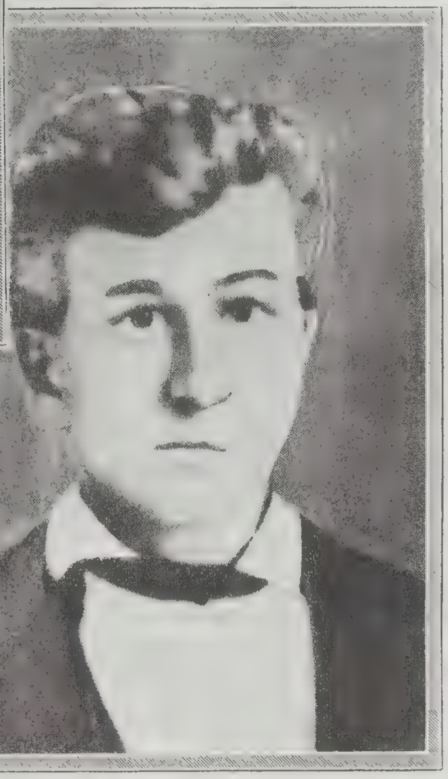
In 1866 they surveyed the Goodnight and Loving trail, perhaps the most famous of all the old cow trails. It began in Young County, Texas, and extended southwest to the Pecos River; here it turned northwest, following the general course of the river four hundred miles to Fort Sumner and beyond. It then crossed the divide between the Platt and the Arkansas rivers, seventy-five miles east of Denver. It ended at the mouth of Crow Creek.

The first part of the trail down to the Pecos was through good country with plenty of grass and water, but along the Pecos it was bleak and forbidding. There was little grass and the only semblance of tree life was the wild mesquite. In speaking of this country Colonel Goodnight recently said: "The Pecos country was the most desolate I had ever explored. The river was full of fish, but besides the fish there was scarcely a living thing, not even birds and coyotes." The country was again good along the upper Pecos and in Colorado.

Such was the trail over which Loving made his last drive. The events of this drive deserve a prominent place in the history of West Texas.

Loving and Goodnight had now entered partnership—an ideal one, since Loving knew the trail and its ways, and Goodnight knew men and cattle. Both were men of high honor and courage. Loving was fifty-five years old; Goodnight, thirty-five.

It was in June, 1867. The outfit consisted of twenty-five hundred head of steers and eighteen men. From the first the Indians were a constant menace. They attacked the outfit at the fork of the Brazos River, stampeding the herd and wounding one of the men. On the lower Pecos they again attacked and succeeded in getting away with three hundred and sixty head. An unsuccessful attempt was made to recover them.



Oliver Loving at the age of 55. This picture was taken just prior to his last drive in 1867 (at Weatherford, Texas).

The outfit had gone one hundred and fifty miles up the Pecos when Mr. Loving, having seen no further signs of Indians, decided to take one of the men and ride on ahead to secure the government contract for furnishing beef to New Mexico, which was to be let at Santa Fe. His partner did his best to dissuade him from this perilous venture, for two lone men would have little chance against the Indians, who might surprise them at any time. But Loving was determined. He asked Joe Wilson, a trailman, who having but a few head of cattle had attached them to the large herd, to go with him. Wilson agreed. Loving could not have selected a better man, for Wilson was a brave and genial man.

Promising Goodnight that they would travel entirely by night, resting and hiding in the daytime, they set forth. They rode good horses and each man was armed with two pistols and a rifle. They had traveled but two nights when they grew weary of these arrangements, especially as there were no signs of Indians; so, throwing caution to the winds, they continued the journey by daylight.

They had immediate cause to regret this decision, however, for on the afternoon of the first day they saw a large band of Indians loitering across the plain to the south of them, apparently shooting prairie dogs. The white men left the trail and dashed toward the breaks of the river, their only hope of protection. Even as they started the savages gave pursuit. A mad race followed, but the white men reached the river first. They tied their horses to some bushes and ran behind a sand dune on the bank of the river and into a spot which offered good protection. They had barely done so when about six hundred Comanches swarmed into the breaks.

A small arroya had cut a notch eight or ten feet from the edge of the water to the sand dune. By lying close to the bank at the dune, the men were safe from the arrows of the redskins. There was only one direction from which they could be reached and that was from across the river; but their guns kept this space clear. They were further fortified by a bend of the river above them and one below them. The Indians, perceiving that they could not reach the men without imminent danger to themselves, asked for a parley, and the men decided to grant it. It was arranged that Wilson, who could understand the Indians, should go out and talk to them while Loving stood guard to keep any who might be lurking in the brush on the river's bank from shooting his comrade in the back. The two men were several yards from their hiding place when Wilson thought he heard the snapping of a twig.

"There's an Indian in that brush now," he warned.

"No, there isn't," Loving replied. "You are just scared." As he said this he started toward the bushes. Across his left arm he had a holster with two pistols which he had been carrying over his saddle horn.

The main body of Indians was about 150 yards away at the foot of the sand dune. Wilson kept a keen eye on the bushes which Loving was approaching; for he knew that if there was a demonstration from that direction, the other Indians would charge. Loving had gone about twenty yards when an Indian rose from behind the brush and leveled his gun at Loving. Wilson's shot shattered the silence simultaneously with that of the Indian. The Indian dropped behind the brush and Loving staggered toward Wilson.

"I'm killed," he gasped. "Take my gun and do the best you can with it."

At that moment Wilson saw the Indians from the foot of the hill charging them. He emptied his own gun on them; then seized Loving's and emptied it. The savages were repulsed and the white men again got to cover.

Loving was badly wounded, but not dying, as he had thought. The bullet had passed through his wrist and into his side. He was already weak from loss of blood as Wilson assisted him to a clump of smartweeds, in which he was hidden from view of the enemy. With Loving's boot for a receptacle, Wilson brought water and washed his wounds. Meanwhile, the arrows fell thick and fast; the Indians shooting them up so they would fall into the ravine—this method was their only hope of reaching the men. In the same way they deluged them with rocks and clods of earth; but the men, who were lying against the bank, were not injured by them.

As Wilson lay beside Loving, waiting tensely for anything that might happen, he observed a slight movement of some tall weeds a few feet away. He knew that an Indian was creeping through them, parting them with his lance as he came—the Comanches always carried lances. The Indian came nearer and nearer. He was about to poke his head from the weeds, when a huge rattlesnake roused up right in front of him.

The reptile gave a loud warning and then glided off in the opposite direction which was toward Wilson. To his unspeakable horror it came to his side and quite chumily coiled itself. His life now hung by a thread. If he fired at the Indian, who, he knew, was even now leveling his gun at him, the noise would cause the snake to strike; but Wilson feared the snake more than he did the Indian, so he remained perfectly still. The Indian then fled from the uncanny scene, evidently frightened by the performance of the snake, for this was the sort of thing which aroused the superstition of the

(Concluded on page 13)

Texas longhorns, still famous as supplies of beef for the northern markets.

Bristol's Historic Glory Shown in Brilliant Pageant

Picturesque English City Claims Title of "Cradle of the British Empire" and Has Special Claims on Interest of Americans

By PAUL TYNER

Cabot Tower, erected in honor of the great navigators, and occupying a commanding site overlooking the city of Bristol.

LONDONERS speak of Bristol, the metropolis of the West of England, as "slow" and "the last thing in provincialism." Some go so far as to describe it in Goldsmith's line, "Remote, unfriended, melancholy, slow." With similar superior disparagement, it is mentioned by denizens of those bustling midland towns, Manchester, Liverpool, Nottingham, Leeds and Bradford. All the same, Bristol has impressed me, in the course of a fortnight's sojourn, as the most English of English cities. What I mean is that it comes nearer than any other town in the kingdom to realizing the average American's expectations of what an English city should be. In remarkable degree, it fulfills the mental pictures derived from our reading of English history and English drama. It makes concrete and present to the eye old English tales of adventure and exploration. And it is very, very like the older parts of Boston—Boston, U. S. A.

Bristol certainly has peculiar claims on the interest of Americans. I was reminded of this on the day of my arrival: when crossing the St. Augustine Bridge my attention was attracted by a bronze tablet recording the fact that it was from the port of Bristol, in the Bristol ship *Matthew*, that John Cabot and his son, Sebastian, sailed in May, 1497, on the voyage during which they "discovered the continent of America" a year before Columbus sighted the mainland.

To Bristol the Cabots returned in the following August with the great news of a new world.

One is not long in Bristol before one gets sight of the splendid Cabot monument crowning one of the city's chief heights, Brandon Hill. The Bristol Art Gallery, too, is full of reminders of Bristol's claim to distinction in having sent out the intrepid Venetian who "first planted the flags of England and Venice on the northeastern seaboard of North America in June, 1497." Bristol for century after century, indeed, figured pre-eminently as the city of "merchant venturers." It was an important seaport and center of foreign trade and shipping long before London or Liverpool became conspicuous in maritime greatness.

On this first voyage of the Cabots and in the subsequent voyages and those of Richard Ward, Thomas Ashehurst, John Thomas, Robert Thorne, Martin Pring, Robert Aldworth and Richard Hakluyt, with other only less famous pioneers of exploration, discovery and conquest, it was Bristol men who furnished the ships and the money and the sailors—to say nothing of the spirit of faith, enterprise and enthusiasm with which they pushed their way across uncharted seas into strange lands. From Bristol the steamship *Great Western*, pioneer of Atlantic steamship traffic, sailed for New York, April 8, 1835.

Descent from John Cabot is proudly claimed today by many of the first families of Massachusetts. Senator, Henry Cabot Lodge is prominent among these; but banking and legal lights like George and William Cabot Ward are hardly less eminent. The last named, it may be remembered, also achieved some reputation as a writer, his essay on Lessing's "Laocoon" being famous in its day—the day of Nathaniel Hawthorne, Longfellow, Lowell and Emerson.

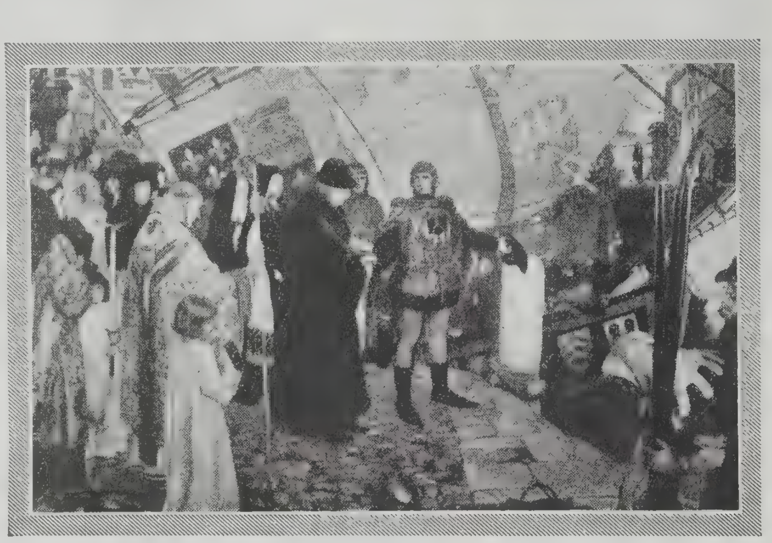
Bristol is most closely identified with the planting of an English colony in Newfoundland; but men of this town were also among the emigrants in the ships that followed in the wake of the *Mayflower* and who founded homes in Massachusetts and Rhode Island. John Jay, the first Chief Justice of the United States, was the descendant and namesake of one of the earliest of these daring merchant venturers.

Another link of America with Bristol is William Penn, to whose colonial enterprise the present state of Pennsylvania is a memorial. Penn was long a resident of this city and was married here. Other hardy mariners associated with Bristol were Alexander Selkirk, the filibuster and original of Robinson Crusoe, and William Dampier, the dauntless buccaneer who was the first Englishman to sight the Australian coast.

To the bold spirit of daring and adventure of these early seamen Bristol owes the proud title which it has long claimed of "Cradle of the British Empire." And today Bristol is waking up in marvelous fashion, as a direct outcome of the dramatic revival of the glories of her early history in a magnificent historical pageant which was given here every evening in the week following Empire Day and then transferred with all its scenery and 3,000 performers to the big British Empire Exhibition being held at Wembley Park in London.

The opening episode, following a fanfare of trumpets that carries the spectators back, not to the misty beginnings of Bristol's history, but to a very early era, that of the year 1216, marked by the re-signing of the Magna Charta by Henry III, is built more upon fanciful tradition than on veritable historic records; but it serves very well to bring before the mind a picture of that period far more vivid and impressive than any description in the books.

In a second episode, King Edward IV, having obtained the throne by a decisive victory over the Lancastrians in the snowstorm battle of Towton in Yorkshire, visits Bristol in the course of a progress through the land.



Departure of John and Sebastian Cabot from Bristol on their first voyage of discovery in May, 1497. This painting is one of the gems of the Bristol Art Gallery, and is the work of a Bristol artist, Ernest Board, R. W. A.

Episode three is the central picture of the pageant. It tells the story of Cabot's famous voyage. The news is spread that the good ship *Matthew* is in the Channel and a crowd of citizens, agog with excitement, assemble to give him welcome. They are joined by the mayor, sheriff, members of the town council and representatives of the king in procession to the High Cross. Watchers who have been stationed on the hillside hasten to the spot and report the arrival of John Cabot with his son, Sebastian, and their brave crew. A great cheer is raised as they appear. John is affectionately embraced by his wife and two younger sons, Lewis and Sancius. Happy reunions also take place between the members of the crew and their families.

The mayor accords Cabot and his men a hearty welcome home and the intrepid mariner asks a blessing on "us returned from the perils of the sea and in *newfound lands*." The Abbot of St. Augustine's Abbey bestows his blessing, and, at the request of the mayor, John relates his adventures to the astonished crowd. His recital is to this effect:

> "When we cast loose from Bristol we did sail many leagues, far beyond the western shores of Ireland and to the far north, until we did turn our sails to the westward. On the twenty-fourth day of June, we did see land arise above the ocean's surface. . . . Landing on the coast, I did set up the banners of this realm and of St. Mark, for the honor of England and of Venice, whence I came."

A member of the council asks Cabot if he saw aught of gold or other precious metals. To this he answers that he did not, but they held the opinion that if a man but trended a few leagues farther south he would find great store of gold and silver, which "would make the King's Majesty the mightiest Prince of all Christendom." Sebastian interrupts to declare that they were not coming home empty-handed, as there were many strange things aboard the ship and they would be shown marvels. He gives a signal and three terrified savages are dragged forward howling. They escape to the dire alarm of the townspeople, and it is some time before they are recaptured. The excitement subsiding, further proof positive is shown in the skeleton of a whale: "a wondrous great bone of Leviathan himself." The king's representative thereupon invests John with a gold chain and, in the name of the monarch, appoints him Great Admiral of England. Great is the shouting when Cabot kneels to receive the royal gift and again when the mayor, in prophetic vein, replies to the royal envoy's declaration that "the king delights to honor men who had brought honor to England and to this town of Bristol."

"Truly, sir, you speak wisely," says the mayor, "Great is the fame of Bristol, and greater still, I ween, shall be its fame by reason of this wondrous venture. Methinks I see ship after ship pass down Avon River in the path that the *Matthew* hath furrowed, and mighty nations speaking our tongue arising in the new-found lands, and, though this tall ship's timbers be decayed and we ourselves be dust, yet they shall remember the *Matthew* and the town that sent her forth."

The good old days of Merrie England in the golden reign of Queen Bess are brought into life, color and movement during the fourth episode with its contrasting moments of simple rusticity and of regal pomp and circumstance.

"Venturers and empire builders" are celebrated in episode five, which is divided into three parts, dealing with the events from 1610 to 1711. First we had the departure, in 1610, of John Guy, on his appointment as governor and commander of Newfoundland by James I, with the first party of emigrants for Newfoundland.

Episode III representing the triumphant return of the Cabots, and their reception by the city—Left to right—Sebastian Cabot (E. J. Harold); Mistress Cabot (Mrs. Darby); John Cabot (F. M. Gladwell); the Mayor (W. Bowrie); King's officer (C. Cavell).

There are amusing incidents in the roll call of the emigrants, their leave-takings and their grappling with their bundles and boxes. Of a more impressive and serious nature are the godspeed of the mayor, the blessing by the bishop and the chanting of a canticle by the choristers.

Next we have the reception in Bristol of Captain Thomas James, of Hudson's Bay fame, on his return from London where he had reported to the king how, in the name of the Merchant Adventurers of Bristol, possession had been taken "for the king's use" of the land they had found.

A brief interlude serves to bring in Admiral Sir William Penn, his son, William Penn, once a soldier of Cromwell's and later a Quaker and founder of Pennsylvania, along with Master Callowhill, whose daughter was married to Penn at the Friends' Meeting House in Bristol. The three pass across the arena discussing the plans of George Fox himself for the establishing of an American colony.

The third part of this episode is concerned with the return of Captain Woodes-Rogers from the most famous of all British privateering enterprises. The harbor master announces the arrival of the bold bucaneer in a schooner and reports the ships *Duke* and *Duchess* safely anchored in the Thames with many prizes. Woodes-Rogers appears and with him Will Dampier, "him that did explore the coast of the great territory that men call New Zealand, and also of that great island to its north (Australia)."

Figuring in this gallant company also are Captain Dover, "he that aforetime did physic us with powders," Alexander Selkirk, clothed in the traditional white skins of Robinson Crusoe, and Daniel Defoe himself. The harbor master, nudging Defoe, says, pointing to Selkirk, "There be a story for thy pen," and the author pushes through the excited crowd to talk with Selkirk while the procession passes on.

Many consider the sixth episode, portraying the women of Bristol in 1643, as the most thrilling of the seven. It enacts a vigorous story of Royalists and Roundheads, written by Charles F. Latham. Its central incident is the defense of the Froom Gate in Bristol by brave Dorothy Hazard and her plucky townswomen on the morning of July 26, 1643.

The last episode is in striking contrast to all that precedes and brings Bristol's history up to a very exciting epoch of comparatively modern date. It portrays the Burke election of 1774. Burke is one of the city's idols, a remarkably fine statue of the famous orator-statesman (who for many years represented the city in the House of Commons) still adorning the principal city square.

Episode II—King Edward IV (G. A. Widman), being entertained at the Rudde House by the Mayor, William Canynges (B. L. Hodges). This was one of the most striking of the scenes depicting the history of the city.

We are given an interesting, and in some respects amusing, picture of an old-time election in England. A seething crowd of varying political creeds gather around the hustings. They include Tories, Whigs "Americanists" and King's Men, sporting the respective colors and armed with staves and clubs. Warcries and snatches of election songs are heard. Becoming impatient, the crowd calls vociferously for the mayor. He appears at last with his officials and the candidates. Pandemonium ensues. When the uproar subsides a bit, the mayor seizes his opportunity to declare that the longest poll ever taken in the borough, one lasting twenty-eight days, has resulted in the return of Mr. Cruger and Mr. Edmund Burke.

So ends the pageant. There can be no doubt that it makes live appeal to historical interest, causing the best and most heroic in the city's past to breathe again and furnishing very real inspiration and stimulus to a deeper civic spirit. Not that the Bristolians of today are to rest on the laurels won by their ancestors and be content with the empty pride of ancestor worship; but that, in reviving memories of the pluck and enterprise of the old-time Bristol mariners that carried the fame of their city to the ends of the then known world, they are to hear a clarion call to emulate their dauntless spirit. To the point is a phrase from one of Burke's greatest speeches: "He who has no regard for his ancestry is likely to have little regard for his posterity."

It is in profiting by the experiences of the past that the stability of the future can be assured, and looking backward through the centuries Bristol has a long page of history to scan. If the citizens are animated by the spirit of their ancestors there is no fear of the degeneration of the race.

Over the Goodnight and Loving Trail in 1867

Concluded from page 11

old-time redskins. Wilson remained rigidly still and presently the snake glided into the bushes.

About dark the Indians led the horses away, and with them went all the provisions possessed by the trailmen. Night came on and their perilous vigil continued. What must have been Loving's thoughts in those terrible hours, as he lay facing death, separated from his friends by hundreds of miles of wild lands, inhabited only by Indians and herds of buffalo.

Believing that he could not last till morning, he insisted on Wilson's trying to escape before it was too late. Wilson decided to make the attempt.

"Tell Goodnight to get word to my family, telling them how and where I died," said Loving. "If I can, I will keep the Indians off until he gets here; but if I see that they are about to take me, I will commit suicide to escape their torture."

Wilson consented. When the moon went down, shortly after midnight, he divested himself of all his clothes except his undergarments and slipped into the river. Across his shoulder was one of Loving's guns, the only one in their outfit that fired a metallic cartridge. Loving had forced this gun upon him, knowing that the others would not shoot after being in the water, and his only hope was to swim down the river, but he was so handicapped with the gun that he almost drowned. Seeing that it was impossible to carry it any farther, Wilson left it sticking in the sand under the water where the Indians would not be apt to find it.

A hundred yards downstream he knew that he was surrounded by them, but they had not discovered his presence. One sat on horseback in the middle of the stream, splashing his foot in the water. So absorbed was he in this play that he did not see the white man, who, a few feet from him, was drifting by in the shadow of the smartweeds which drooped over the edge of the bank.

Farther downstream Wilson left the river and set out across country in the direction of the herd. The sandy soil seemed barren of growth save that of every variety of sand bur. These brought exquisite torture to the barefooted traveler. There followed a never-to-be-forgotten march of three days. Faint from hunger, going hours without water, for at times he was far from the curving river, he trudged on in the blistering heat of a July sun, which parched the bur-strewn sand beneath his bleeding feet. The second day he found the small end of a tepee pole and this he used as a cane.

By the third night he was almost exhausted, and barely able to drag one lacerated foot after the other. To add to his discouraging situation, a pack of wolves began to follow him. He was afraid to sleep because of them. Their skulking forms were ever near, and all Wilson's efforts to drive them away proved unavailable. No better idea of his plight can be gained than from his own words: "I would give out, just like a horse, lie down and drop off to sleep. When I woke up the wolves would be all around me, snapping and snarling. I would then take the tepee pole and drive them away, but when I resumed my journey they would drop in behind me. I kept this up until daylight, when they left me."

He struggled on until noon, when he reached a hill which he felt sure the herd of cattle would pass. Barely able to move, he crept into a sort of cave which had been whipped out by the play of the wind. In this he was protected from the burning sun. In a few hours the herd arrived, and Wilson staggered out of the cave. "He was the most terrible object I ever saw," Colonel Goodnight relates. "His underwear was stained with mud, his tongue was swollen by thirst, his eyes were wild and bloodshot; and every step he took left blood in the track."

Goodnight made immediate preparations to go to Loving's rescue. With six good men, mounted on the best trail horses, he set out. All that night it rained torrents and was so dark at times that the party was forced to halt until a streak of lightning would momentarily light the way. Only men trained to life on the frontier could have steered a true course. They rode all night and the next day. At four o'clock in the afternoon, they reached the place where Wilson said that Loving and he had left the trail.

On a mesquite bush close at hand was a small piece of paper pinned to a thorn. This was recognized as a leaf from Loving's notebook which he always carried in his saddlebag. On it was a drawing—a bit of Indian cynicism—of an Indian and a white man shaking hands. Oddly enough, the white man was wearing a silk hat, a thing at that time unknown in West Texas.

About two hundred yards north of the trail the party discovered the tracks of Loving and Wilson; whereupon they dashed across the prairie toward the river. Before reaching the bluffs they stopped for a few minutes to decide upon the best method of attack. It was agreed that they surprise the Indians and shoot their way to the bank of the river; but when they reached the bluff overlooking the river, not an Indian was in sight; and when they reached the bank no traces of Loving could be found.

The silent hills gave no clue to what had occurred. It was evident, however, that the Indians had been gone but a short time, for the bank of the river was still wet in places where they had climbed out of the stream. It looked as if they had not found Loving and were still in search of him.

It was unbelievable that he could have escaped from them in his weakened condition. His friends could arrive at but one conclusion: In a moment of imminent peril, he had shot and killed himself, as he had threatened to do, and his body had floated down the river, made swift by the recent heavy rains.

* * *

One afternoon, two weeks later, when the Goodnight and Loving herd was within seventy-five miles of Fort Sumner, Goodnight, as was his custom, was riding ahead to see whether there were Indians in the vicinity, when he saw a man riding toward him. Believing him to be an Indian, he maneuvered around a hill, keeping out of his sight, and came up behind him. Then he recognized him as a white man named Burleson, who had a herd just behind his own. Burleson had gone to Fort Sumner several weeks before, and was now coming out to meet his herd.

Goodnight informed him of Loving's death.

"Why, Loving is not dead!" Burleson replied. "He is at Fort Sumner, recovering from his wounds. He sent word to you to leave the herd and come to him."

All that night the faithful friend rode toward Fort Sumner and arrived there the next morning, making the distance of seventy-five miles in fourteen hours. He found Loving walking about with his arm in a sling and feeling confident of recovery. But his friend was apprehensive after examining his wound. It had been too long neglected.

The next morning after Wilson's departure, Loving discovered that he was much better. The wound in his side, which he had thought fatal, was not really serious. He began to watch for an opportunity to escape. Meantime the Indians continued to deluge the ravine with arrows and stones, none of which reached him. They dug tunnels through the sand dune to within five feet of where he lay; but they dared not put their heads over the bank to get an accurate shot at him. Repeated attempts were made to reach him from across the river, but after losing two of their men, they desisted. Two days and nights they kept him in the ravine. Then he escaped by way of the river, as Wilson had done.

Since the herd had had ample time to arrive and had not done so (this delay was due to the outfit's having halted to rest the cattle), Loving decided that it had been captured by the Indians. So instead of going down the river to meet the cattle, he went up it to a crossing in the faint hope that some passer-by might find him. He reached the crossing two miles upstream. Here a clump of chinaberries grew; and under these he lay, ill and exhausted. His water-soaked gun would not shoot; otherwise he could have killed some birds for food. He thought of searing his Mexican gloves to a crisp and devouring them, but his matches had been ruined in the water.

Many long hours passed with Loving growing constantly weaker; and with no cessation of his intense pain. The only way he could get water to drink was by dipping his handkerchief, which he had tied to a stick, into the stream two feet below. Three days and nights went by in this manner, when at last his indomitable courage failed him, and he was overcome by a heavy stupor.

At noon the third day he was aroused by someone standing over him. Thinking the person was an Indian he seized his gun and leveled it; then remembering that it would not shoot, laid it down again. When he became thoroughly awake he saw that the newcomer was a white boy. He was a German traveling from Fort Sumner with three Mexicans. He had come upon Loving while looking for firewood.

Loving was taken to the covered wagon, where the Mexicans fed him corn-meal gruel. The wagon was drawn by oxen. For $250 Loving hired the men to return with him to Fort Sumner.

When they were fifty miles from that place, they met Burleson, who was riding out for news of his herd. Upon being informed of the situation, he rode back to town as fast as his horse could carry him, sending the government ambulance and doctor to take care of the sick man.

Loving lived for some days after reaching Fort Sumner: but the care his wounds received was not of the best and blood poisoning resulted. "So passed as good a man as ever lived," in the words of Joe Wilson.

Oliver Loving, the first to find outlet for Texas cattle, had made his last long drive.

Sapiro's Dream—An International Wheat Pool

Concluded from page 6

States Grain Growers to function. With Guard and others of this element out of the federation, indications are that the grain growers' organization will be able to develop into a power for the good of the farmer.

There were many other instances illustrating the close connection between Mr. Guard and Mr. Sapiro, and the latter's Jewish backers, but space forbids their telling here. Thus matters went on, with Mr. Guard doing his best for the Sapiro interest, until early in 1923, when Mr. Walton Peteet was employed by the American Farm Bureau Federation as director of co-operative marketing. This was one of the most important posts in the federation, because the organization is pledged, as has been shown, to sane forms of co-operative distribution and sale of farm products. In a later paper, Mr. Peteet's activities will be more thoroughly discussed. Suffice it to say here that Sapiro picked him up in a tomato association in Texas, an association which had met disaster under the Sapiro Plan.

From telegrams and correspondence now in the possession of certain men, it is well established that Mr. Peteet was pledged to put over the Sapiro program, that is, to make Sapiro master of the federation. That the tracks of the Jewish attorney from San Francisco might be well covered, Mr. Guard brought Mr. Peteet into the farm bureau federation, introduced him as his own discovery, and succeeded in obtaining his appointment. Then began a constant campaign on the part of Mr. Guard and Mr. Peteet aimed at the executive committee of the farm bureau federation, to obtain, first, endorsement of the Sapiro Plan of co-operative marketing, and second, the employment of Aaron Sapiro as marketing director. Other telegrams and correspondence show that the scheme was to bring Sapiro in as director of marketing, and, as soon as possible, promote him to be secretary, whenever the Sapiro-Peteet-Guard combination could influence the executive committee to drop J. W. Coverdale, executive secretary.

Be it said here that Mr. Coverdale is still secretary, and that neither Sapiro, Guard nor Peteet are any longer with the American Farm Bureau Federation.

In this same scheme, Mr. Peteet was to have been promoted from director of co-operative marketing to the position of marketing director, vacated by Mr. Sapiro, and Mr. Guard was to remain in the very important post of publicity director.

In his work for his Jewish friends, Mr. Guard promoted a plan for a special train, bearing four or five hundred farmer members of the federation. This train was to tour all the Sapiro Plan co-operative organizations in the Middle West and East, "to observe the manner in which these associations are functioning, and to report on the same."

Now, on February 1, 1923, Mr. Peteet promised certain members of the executive committee, who saw through the Jewish plot, that he would not work to bring Mr. Sapiro into the federation. This first day of February was the date on which Mr. Peteet entered the American Farm Bureau Federation. In less than two weeks Mr. Peteet wrote a letter to O. E. Bradfute, then as now president of the federation, admitting that he (Peteet) had had conferences with Aaron Sapiro, looking to the employment of Sapiro by the federation.

The train which Mr. Guard promoted, then, had the support of Mr. Peteet also, but there suddenly rose up J. W. Coverdale, the executive secretary, for whom organized Jewry appears to have few if any terrors, and blocked this junket by refusing to use the funds of the federation for it, or to allow any of the employes of the federation to ride upon it.

Fearing for the safety of his agents in the federation, Sapiro gave them the word to drop the train plan, and it was dropped.

Had this train been sent out, packed with people friendly to the Sapiro Plan, the result in all probability would have been the turning over of the American Farm Bureau Federation to Aaron Sapiro.

The astute Mr. Peteet thought himself strong enough to "put over" the plan to employ Mr. Sapiro, but the farm bureau federation flatly refused to accept his recommendation. On March 1, 1923, a marketing conference was held in St. Paul. This conference was attended by Mr. Peteet, who there tendered his resignation. Mr. Coverdale also was there, and it is of record that Mr. Guard, from his offices in the headquarters of the federation in Chicago, wired Mr. Peteet certain timely advice regarding Mr. Coverdale. This advice appears to have arrived too late to save Mr. Peteet, but Mr. Coverdale, in his address to the executive committee, said something which is of particular interest to those who are members of the National Council of Co-operative Marketing Associations, of which Mr. Peteet is now secretary, and in which he is the directing and controlling power, with Aaron Sapiro back of him. Mr. Coverdale said:

> **"Believing that we (the American Farm Bureau Federation) had in Mr. Peteet a director of marketing who would carry on in the interest of the farmers themselves, we find him at once completely aligned with Mr. Sapiro and his followers, guided by their same prejudices, and outdoing them in his antipathies. And, gentlemen, I want to charge here and now that when Mr. Peteet came into this office, he came, not as a free agent, but *bounden to direction other than that of this federation.* I want to state that he had pledged to deliver this American Farm Bureau Federation to the leadership of Mr. Sapiro, and the evidence of this fact is unmistakable. Mr. Peteet's resignation was not his own free will act, but was demanded of him by Mr. Sapiro, who set a time limit in which to fulfill his pledge made to Mr. Sapiro, or else resign, and join with Mr. Sapiro in the latter's campaign to destroy the Farm Bureau and to set up an organization of their own."**

This is the whole situation in a nutshell—rule or ruin; either give up the American Farm Bureau Federation, with its more than one million and a quarter American farm families, to organize Jewry or stand a fight; surrender an American institution to Aaron Sapiro or let that institution perish!

And now comes the most interesting chapter of the entire effort of the Jews to exploit the American Farm Bureau Federation. Mr. Peteet had failed to bring in Mr. Sapiro. Mr. Guard was in about the same position, though he still held his place with the federation. Their loyalty to Aaron Sapiro, whether racial, financial or merely because they believe in his theories, is commendable; but their actions toward the American farmer are hardly such as to inspire confidence on the part of the agriculturist in their present or future operations in his behalf.

Mr. Otto Kahn, international banker of New York, was a close personal friend of a certain official of the American Farm Bureau Federation. This official is a Gentile, and a man whom the writer has found to be so completely honest that he believes every other man, especially his friends, to be equally without guile. Mr. Kahn will be remembered as the man who gave a large and costly banquet to "American agriculturists" in New York a few years ago. This banquet was previously described by the writer in these columns. It had two interesting features, first, the absence from the banquet board of any man who could by any chance be called an American farmer; and, second, the endorsement of Mr. Sapiro and his plans by Mr. Kahn. After Mr. Peteet and Mr. Guard had been unable to introduce Mr. Sapiro in the farm bureau federation organization, *Mr. Kahn had a meeting with this official of the federation.*

Shortly after this conference, Aaron Sapiro was appointed legal counsel to the department of co-operative marketing of the American Farm Bureau Federation.

This official of the federation shall, for the present, remain nameless here. This man simply took Mr. Kahn's advice as to the character and abilities of Mr. Sapiro, and threw his influence toward a step which, in the opinion of his friend, the international banker, would be a good one for the federation to make. Beyond this there were eight members of the executive committee of the American Farm Bureau Federation who already had confidence—to say the least—in Mr. Sapiro and the Sapiro Plan. On April 6, 1923, Mr. Sapiro was employed at a salary of $8,400 a year and traveling expenses, in the position above mentioned. Mr. Peteet was out; Mr. Guard was still in; Mr. Sapiro came in.

As far as there is any record, Mr. Sapiro's services to the American Farm Bureau Federation, during the eleven months in which he was employed by it, consisted of:

> Three visits to his office in the headquarters at Chicago;
>
> An appearance before a committee of nine men who were forming an egg-marketing association, and the giving to them of a small amount of legal advice.

For this eleven months' work, Mr. Sapiro was paid $7.849.40 and then dropped, early in 1924, from the payroll of the federation. Many members of the federation believe that $1,962.35 is a high price to pay Mr. Sapiro for each of four casual visits to the offices of the organization. When one considers that the actual cash handled by the average American farmer each year totals less than $200, there does appear to be some logic in such a statement. On the other hand, there are a number of members of the federation who believe that the acquaintance with the methods of Messrs. Guard, Peteet and Sapiro, obtained during the past three years, is worth all that the federation paid for it.

Now, Mr. Peteet was gone; Mr. Sapiro was to go, but did not know it, and, in between these two great and good friends, the third friend, Mr. Samuel R. Guard, was on the job as director of publicity. It is probably not too much to say that the publicity issued by the American Farm Bureau Federation during Mr. Guard's tenure of office, was at least delicately flavored with pro-Sapiro Plan suggestion. But Mr. Guard is a very radical gentleman, who believes in doing things as they should be done for the benefit of an idea, not as they could be done for the benefit of the farmer. In October, 1923, President Bradfute, of the federation, suggested to Mr. Guard that he might be out of step with the organization. Mr. Guard replied, according to his own statement:

"The organization is out of step with me."

But Sam is modest, and his desire to keep step by himself was gratified. He was permitted to resign, which he did, afterward making a speech in which he said some very unkind things about the federation. Then, Mr. Peteet and Mr. Guard were gone; Mr. Sapiro remained, though it was at all times most difficult to find him around the headquarters of the American Farm Bureau Federation.

Came an election. One of the eight pro-Sapiro-Plan members of the executive committee had passed away; the other seven were not returned to office by the membership. Mr. Sapiro was dropped, early in 1924, and the American Farm Bureau Federation is now proceeding on its way honestly helping the agricultural industry of this country without the aid of Mr. Kahn, Mr. Sapiro, Mr. Guard, Mr. Peteet, or any of the other Jewish or Jew-controlled gentlemen who tried so earnestly to assist the American farmer through their work with the federation.

Mr. Sapiro was recently in Europe, accompanied by his good friend, Judge Bingham, of Louisville, endeavoring to find some place in which he could store the unsold 1922-23 crop of his Kentucky tobacco co-operatives—anywhere, just so the tobacco-grower could not see it.

Mr. Guard is on duty for Jewry endeavoring to set up private farm foundations, and junior farm clubs, *for Mr. Julius Rosenwald, of Sears, Roebuck & Company.*

Mr. Peteet is secretary of the National Council of Co-operative Marketing Associations, designed eventually to bind all the Sapiro-Plan co-operatives into one national organization, where they can be the more easily controlled and directed by Mr. Sapiro.

Thus, all the little pals are well taken care of—while the American farmer pays their bills.

Study in Race Values—Italians

Concluded from page 2

A fourth characteristic of the Italians is in the realm of temperament; they are naturally inclined to be *excitable.* The Italian historian, Ferraro, tells us that "even at the present day, the Sicilians throw so much passion into their political struggles that great circumspection is required in sifting the accusations hurled by one side against the other, when rivalry and party animosity come into play." Unfortunately the excitability of the Italian does not always satisfy itself in verbal argument.

The quick or hot temper of the Italian shows conclusively in criminal statistics in America. In New York county courts the percentage of Italian crimes of personal violence is more than twice as high as the next below it. That his record for crime is due much more to the inherent Italian quick temper is proved by the additional facts on crimes committed for gain, gathered from the same court records. The percentage of Italian impersonal gainful crimes, that is, theft, burglary, and so forth, is the lowest of all the foreign groups.

The Italian also has the fault of wife desertion, probably as a result of his quick temper, but he is not permanently a stay-away. He cools off and almost invariably returns to his home.

A fifth national characteristic, also in the realm of temperament, may be called that of the Italian *social charm,* expressing itself in manners gracious, gay and dramatic. Henry James speaks of "that profundity of Italian cleverness which enables people to appear more gracious in proportion as they are more acutely disappointed."

Says an Americanization Home Teacher, "It is so heartening, after a hard day's going, to meet with the instant warm response of the Italian child or adult. The warmth, the gayety, the flash of eye and smile in a glad welcome, the shrug of eloquent shoulders, the laughter always ready, these and more spell the charm of the Italian responsiveness. The innate grace and often startling beauty glow above all surrounding impedimenta. They are a brave, gay people, colorful, rhythmic, with a spontaneity of childhood."

Everybody sings in Italy, and some of the Italian boys on the streets of our American cities, we are told, can whistle whole operas, changing their voices to imitate the different instruments in the orchestra. Our Ambassador to Italy, who saw there the rise of the Fascisti, has just written of it: "I am more and more conscious of its lyric and epic character. Mussolini has the whole country singing."

In America the Italians demand their own kind of social environment to such an extent that it greatly determines the economic life of the family. The United States Immigration Commission says: "It may be asserted confidently that the primary reason for the Italian choice of trucking and vegetable gardening in preference to diversified farming is a social one."

Italian genius overtopped the world in at least three men: Dante, Michael Angelo, and Raphael. But so common to Italians is exalted intellectual power that a score of names come to our minds of men who would be placed in the highest rank among other people: Petrarch, Boccaccio, Savonarola, Leonardo Di Vinci, Andrea del Sarto, Columbus, Galileo, Manzoni, Garibaldi.

In Lanzis' "History of Painting," which was written more than a hundred years ago, there are presented 3,124 Italian painters "whose transcendent genius flooded the world with a glory hitherto undreamed and opened the very portals of paradise."

Of the musical talent of the Italian it is hardly necessary to speak. "I wonder what Italians have in their 'gosier' (throat) that we haven't," says Madam Waddington, "that gives such charm to their simplest song." "It seems unfair for me to give advice to girls along these lines," says Luisa Tetrazzini. "Ever since I was a child I have loved to sing. I knew both the words and music of several operas before I was even aware of the fact. When I presented myself (to the teacher), Signor Cecherini, who had taught my sister, turned to the examiners and said, 'But this is no little girl; she is an artist.' After hearing an opera for the first time I can sing almost anything in it."

What does this mean for America? Mangano tells us that American life robs his Italian brothers here of their inherent feel for things beautiful and spiritual, and that the materialism of our day deadens them and makes them sordid. Amiel's prophecy that in the epoch of democracy "the useful will take the place of the beautiful, industry of art, political economy of religion, and arithmetic of poetry," must not be allowed to come true in America.

I have endeavored to give a brief glimpse of the racial personality of the Italians in America. I would recommend personal acquaintance with our fellow-countrymen of Italian birth as the best way of understanding them. I may add that by this means we may not only help to profit America, but may make a good beginning in that racial understanding and appreciation without which the longed-for goal of world peace is impossible of attainment.

Stream of Patients Flows to Orientals

Concluded from page 9

Thereafter the new "doctor" takes the word of the patient for the cause of the disease the latter believes he has, and doses him with the powdered snake-skins, dried fig leaves, or whatever the correspondingly numbered package may contain. The first three numbers refer both to specific diseases, particular packages, and to the financial ability of the patient to pay. The entire fifteen refer to drugs and diseases, but there are only three grades of financial standing—good, better and best.

Liquor, consisting largely of a potent Chinese brandy, is to be found in virtually every office of a Chinese "physician." Under the name of "stimulator of the will to live," this stuff is sold as medicine to the patient, but sold only one drink at a time, to be drunk before leaving the premises. It is also true that toads, beetles, small snakes and pieces of meat, supposed to have come from the carcasses of wild animals, are pickled in this brandy, and the liquor used as a mixing fluid for certain herbs and powders. The mystery is that these Chinese "medicines" do not kill the patient quicker than his own disease. Elephant skin, to cite one example, pickled in this brandy, is a favorite remedy for eczema, scrofula, and other so-called "skin diseases." Heart of the leopard, preserved in brandy, is "prescribed" by these Oriental crooks as "a most efficacious stimulant of the heart and brain, making the former strong and the latter crafty."

When the writer went to obtain a diagnosis and treatment from a nationally known Chinese faker in San Francisco, he was met by the interpreter and ushered into the presence of a middle-aged Chinese, seated behind a table, with only the top of his head visible above a black cloth screen. There was a chair on the outer side of this table, opposite the "doctor," and a slit in the screen a few inches above the surface of the table.

With the interpreter standing beside me, I took the chair, and on instructions put my left hand through the slit in the screen. Another hand, presumably that of the "doctor," grasped my wrist and the pulse-taking was under way. I could hear no watch or other timepiece. After this, my other hand was put through the slit, the left hand having been withdrawn, and the "pulse" of this wrist also was taken. Then I was requested to put my face against the screen and stick out my tongue. I did so, and found that the slit was so carefully measured that I could not see through it to get a glimpse of the features of the "doctor." About a minute passed, nothing touched my tongue, and I was told that the diagnosis was completed.

I was then asked my age, character of my employment, how I felt in my right leg below the knee, my right leg above the knee, similar parts of my left leg, my arms, my abdomen, my thorax, my neck, my head, ears, eyes, nose, and so on. I was informed that I had not enough blood, bad circulation, and that I was "lacking in steam." To replace this "steam" would cost me seven dollars a week, payable in advance, after which I would receive a "treatment," and would come every other day until three "treatments" had been given, when I would have to put up another seven dollars.

This was agreeable to me, the seven dollars changed hands, and I was led out into the waiting room, and after about three minutes a small boy, evidently a Chinese-American halfbreed, appeared with a cup containing about half a pint of some sort of decoction, brown in color, with a number of leaves at the bottom. The boy stood waiting for the cup. Turning my back on him I walked toward the opposite corner, as if to look more closely at a bit of embroidery on the wall. While in this corner, I poured about half of the "tea" into a small flat bottle which I had brought in a coat pocket, and then walked back, drinking the remainder of the liquor from the cup.

The only effect of this medicine on me was that of a strong physic, while two chemists were unable to say with certainty what it contained, though each made two analyses of the mixture. One said he believed the composition to be senna leaves boiled with willow bark.

In taking up what amounts to a nation-wide investigation of these fraudulent "physicians" and "herbalists," the medical boards of the various states, at last stirred to action by the efforts of the California board, seek to prevent the ignorant from diagnosing illness and prescribing medicines. The majority of these boards, though they receive a percentage of the fines imposed on swindlers in their fields, are willing, even anxious, that these men be placed on probation, rather than fined, provided they will refrain from further activities as triflers with the health and lives of the people of this country. In California, where the number of Chinese "doctors" is the largest of any of the states, the State Board of Medical Examiners has reached the point in its crusade in which it does not ask for fines for these crooks, but merely that they be compelled to refrain from "practicing."

The convicted Chinese, on the other hand, virtually demands a fine, refuses to promise anything about his future activities, pays his fine and returns to his nefarious work, considering that fine merely as a sort of "white-devil tax," which has to be met every so often, and must, in turn, be taken from the pockets of other "white devils," with heavy interest added to pay for the inconvenience caused to the "doctor." Indeed, many of these Chinese, when arrested for practicing medicine without a license, and not from criminal operations or peddling narcotics, at once plead guilty and throw themselves on the mercy of the court, usually getting off with a fine of $100 or less. So profitable is this "herbalist" graft that the "doctors" in the larger cities are willing to meet the maximum fine once a month, if only they may remain in business.

The law limits the penalty for practicing medicine without a license, and this fine cannot be increased for repeated offenses. But judges in city, county and state courts are apt to make the fines for first offenses smaller than for second or third convictions. Many of the Chinese, then, change their names, after their first conviction, and, if convicted again, appear as first offenders under an entirely different name.

Under existing laws, the only sure way in which these dangerous fakers can be eliminated is through the refusal of the people to patronize them. As long, however, as the white man or woman is willing to take a chance with his or her life and health by putting them in the hands of men with no knowledge of either medicine or anatomy, operating in open violation of American laws, the Chinese "doctor" will flourish, literally on the lifeblood of his victims.

The Chinese medical system is founded on a book called "Pen T'sao" ("The Herbal"), completed by Li Shih-chen in 1578, after twenty-six years of work on it. Neither the book nor the medical system has been changed since then. On the erroneous, antiquated and largely ineffective medication prescribed in this book, and in careless copies of certain parts of it, the Chinese "doctors" fraudulently operating in the United States base their system of drugging their patients.

In this book 1,892 varieties of drugs—animal, vegetable and mineral—are listed under sixty-two classes in sixteen divisions, and with 8,160 fixed prescriptions, "from which the conscientious physician will not deviate for any disease." The fundamental number of recognized drugs, corresponding to the "elements" in modern chemistry, is 365, the same as the number of days in the year. Of these, 120 are called *sovereigns*, entirely beneficial, taken in any quantity, at any time, and for any number of days; 120 are called *ministers*, some of them declared to be poisonous, and all to be administered "with discretion"; while the remaining 125 are called *agents*, all poisonous, but effective in curing diseases, "if administered in proper doses." For 346 years Chinese "doctors" in China and abroad have followed this book, without changing their drugs, their compounds of those drugs, or their methods of medication.

The Lure of the World's Aerial Theater

Concluded from page 3

This has been a bitter one the past year, even reaching the courts. Radiocasting for profit would be sure to clash with Judge Smith Hickenlooper's decision that programs given in studios do not constitute a public performance within the intendment of Congress in enacting the copyright law. The petition, dismissed by the judge, was filed in the United States District Court in Cincinnati.

There enters, too, the performer proper.

In the early days of radiocasting, a matter of two or three years ago, it was opined that the microphone would be a godsend to ambitious composers, singers, players and monologists who otherwise might be doomed to go unheard by a hurrying world. In other words, the bulk of the performance was calculated to fall on the shoulders of the amateur class, with the possibility that this would yield forth some new genius.

Undoubtedly some very excellent amateur work has been presented, and none would have it otherwise. But the fact is that the listeners-in have, perhaps unintentionally, clamored for professional performing and famous names. To a great many radio will remain an outcast in their homes unless and until the Metropolitan Opera performances will be put on the air, for pay or otherwise. Stars are wanted; big names are a drawing card.

Such is the perversity of many of us, however, that no sooner a star happens along and performs, but does not strike us "just right," either as to selection or delivery, than off goes the dial. Applause cards are furnished by the millions; but what about the criticism cards that are thought rather than sent?

Once in a while a station comes along which draws fire. Such a one exists in New York. Last July a protest was made by the American Radio Association, and by many parents, too, against a broadcast call for chorus girls for a Broadway production. According to Arthur H. Lynch, chairman of its executive committee, the station broadcast the call for girls, with the stipulation that they "have good figures, pretty faces, and neat ankles," and that they exhibit themselves in bathing suits.

Said station has been the object of pros and cons for a year. In general, it is idolized by those who like jazz, vaudeville of the elementary class, and a little rough stuff; it has been execrated by those who like highbrow programs, read Byron and dislike comicality.

Of course, making of a broadcasting station, which has the entree to every home containing a receiving set within its radius, a theatrical employment bureau is decidedly outside limit, and the objections were not justified but also praiseworthy. Empty-pated girls who think they are destined to be famous dancing stars are thicker than peas in New York and environs, and it was not surprising that hundreds of them applied every day for the "position."

Whether mistake, misunderstanding, or deliberate, the incident is ended now, but it was a good proof of *what radio cannot be used for.* A few such incidents would be enough to force parents to put every radio set in the ash can.

The air is full of things, nice things, that it would be a pity to spoil all that has been accomplished by inventiveness and ingenuity by fostering the fear that there might be some unsafe programs or parts of programs in space at any time. It has taken some time and some salesmanship to make a radio cabinet part of the house furnishings in the families of the well-to-do especially, homemade sets made by the children being considered a sort of pastime and toy combined, and the way New York was aroused by the lapse demonstrated that nothing is taken for granted, which is as it should be.

Stories From the Woodland Trails

Some Troubles of Trees—By D. LANGE

A TREE apparently has nothing to do but to grow; while water, air, sunshine, and mineral food come through the operation of physical laws to its roots or its leaves.

In reality, however, the tree has no such easy time. It has to work for a living no less than birds and animals and man himself.

The roots search in the ground for moisture and food. The leaves may suffer from drought, or from an excess of moisture; they may receive too much light and heat or not enough. The living protoplasm in the cells of the tree is constantly trying to overcome or to endure all these unfavorable conditions.

A tree is, however, exposed to many other dangers, and it cannot run away from danger or choose to fight at some other time.

A storm can do little damage to brush saplings, but it will leave a path of destruction through a mature forest, and the bolt of heaven is nearly always hurled at the giants of the forest.

The big sequoias of California would live still longer if they were never struck by lightning. But their tops reach literally into the clouds and make the big trees natural lightning rods between the earth and the clouds.

How tall trees are exposed to danger from lightning can be well observed in the Itasca Forest of Minnesota. Here the old white pines overtop all the younger growth, and every summer the bolts from the clouds find some of the big trees.

As "Only God can make a tree," it always appears to me as acts of vandalism and sacrilege to see signs nailed to trees and fence wires fastened to them, or to find bushes, vines and trees slashed, torn down, and branches broken to secure a few flowers, a little wild fruit or a few nuts.

Flowers should be cut from bushes, not torn off; and fruit and nuts that cannot be gathered without vandalizing the vines or trees should be left where they grew.

The rosin of coniferous trees is a good prophylactic against insects and fungi, but it is certainly "bad medicine" in a forest fire.

The common bur-oak can resist more evil than any other tree in northern regions. It will recover from the effects of drought, it will live through the worst of tornadoes, and it will complacently embed several rings of barbed wire with no apparent inconvenience.

Trunk of a bur oak with five embedded rings of barbed wire.

THE LIBRARY OF THE UNIV OF ILLINOIS URBANA ILL

BRIEFLY TOLD

A turquoise, regarded by collectors as the largest and most perfect in the world, has recently been presented to the Field Museum in Chicago by Hohannes Topakyan, grand vizier of Persia. The stone, which weighs about 400 carats, was an heirloom in his family and its history has crossed the lives of shahs and beys for generations.

The tallest race of people in the world are the Patagonians who inhabit the horn of South America. They average five feet ten and one-third inches. The shortest people are the Laplanders, who average only seven-tenths of an inch over five feet.

The American Federation of Labor lost 710,893 members in 1922, and 269,167 in 1923. The present membership is 2,926,468.

At Stoney Lake, New Hampshire, a summer resort, one may read the sign, "Cottagers tormented by mice take notice. Spencer Piper, of Limos Island, has cats for rent. Good mousers ten cents a week. Kind to children and do not scratch or bite." While he was pasting up his notice, the youthful business man rented two of his cats.

In parts of Turkey and Persia, rug making is carried on in a very primitive way with a loom made by driving two poles into the ground parallel to each other. The distance between the two determines the width of the rug and the weaving is done entirely by hand.

Athletes in the United States hold thirty-five of the ninety world's records for track and field events, recognized by the International Amateur Federation. Great Britain is next with twenty-five and Finland is third with twelve.

Ceylon is nearly the size of Ireland. It is a separate entity, possessing its own constitution, legislative council, and governor. The total of its merchandise trade for 1923 will be upward of $20,000,000.

Next to the Bible, "Pilgrim's Progress" has been translated into more languages than any other book. The number now exceeds 107 languages and dialects.

There were 12,000 Indians in the American forces during the World War. Practically all were volunteers, as the draft law did not apply generally to Indians.

The state prohibition director of Louisiana has suggested to the Louisiana State Boy Scout Commissioner that his organization aid the cause of prohibition by acting as informants.

The burial grounds of China have always been held sacred, not to be disturbed under any circumstances. The result is that one-twentieth of the country is now occupied by graves. The problem is assuming serious proportions.

Ice cream was introduced into this country by a Philadelphia caterer named Bosio in 1800, but it did not become popular until Mrs. Dolly Madison, as mistress of the White House, had it served at state dinners over which she presided in 1817. Since that time consumption of this delicacy has risen until now an average of 2.66 gallons of ice cream are made annually for each inhabitant of the country.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Egypt's largest pyramid, that of Cheops of the Gizeh group, contains 89,000,000 cubic feet of masonry, and the total weight of the stones has been estimated at more than 6,000,000 tons.

Ishbel MacDonald is what Americans know as a college girl. She dresses in a simple fashion characteristic not of her alleged "working" class in society but of all British intellectuals.

Coin divers in the Philippine Islands have gone on strike because of the hunger of the sharks. Schools of small fish have been dynamited to provide meals for the sharks which have become ferocious, surrounding boats on all sides and flopping several feet in the air.

A Canadian explorer recently left Edmonton, Alberta, in company with two others for the purpose of taking photographs of the caribou migration across the barrens. This explorer has received permission to bring out a pair of wild muskox if possible.

The narrowest street in the United States is believed to be in St. Augustine, Florida, the first permanent settlement in the United States. This is Treasury street, measuring only seven feet in width. It was laid out by the Spanish in 1585.

An unknown airplane pilot dropped a note over Talladega, Alabama, recently, stating that there was a "fire near railroad station." An alarm was turned in and the fire in an unoccupied frame dwelling put out without much damage because of the timely warning.

American tourists will spend not less than $300,000,000 in Europe this year. This does not include the millions that will be left there by men and women who are mixing business with the pleasure of touring.

The streets of Seattle, Washington, if placed end to end would reach from that city to San Diego, California.

Twenty labor banks with resources of $50,000,000 were in operation at the beginning of 1924.

The error that edelweiss grows only in the haunts of the chamois among the Alps is quite a common one, says the London *Times*, but it grows in hidden nooks in Brompton Churchyard, and other places.

On September 17, 1923, a crippled German immigrant, his wife and two children landed in New York where they were immediately sent to Canby, Minnesota, to relatives. On July 21, 1924, this immigrant farmer, out of his wages as a farm hand, had paid the $450 borrowed from his brother for passage expenses. He owns four hundred dollars' worth of livestock and has $100 in cash. He has rented a quarter section of land in Fortier Township and will start farming for himself March 1, 1925.

Brewery workers have decreased from 45,000 to 16,000 in the United States.

The average life of men in the colder climates is 55.23 years, as compared with 57.41 for women.

This country once contained 822,000,000 acres of virgin forest. Now only 137,000,000 acres remain.

On the exact spot from which the Pilgrim Fathers took their departure from Immingham Creek in England, for Holland, in 1609, there has been set up and appropriately dedicated a memorial commemorating that event.

John W. Davis is a Presbyterian, but attends the Protestant Episcopal church with his wife, who is an Episcopal communicant.

"More than ever in our history, we want today a generation of young men actuated by high ideals—young men who will think more of service than of self, young men with the capacity and power which is born of knowledge."—*Sir W. L. Sleigh,* Lord Provost of Edinburgh.

A ridge of coral rising only twenty-two feet above high tide Coral Sea, off Queensland, Australia, has been fitted with a lookout station to warn shipping by wireless of approaching storms.

With further reference to a quotation made in the July twelfth issue of this paper, the incident referred to in the quotation "Submitting to the Law" took place in the Federal Convention of 1787. Franklin's motion that "prayers imploring the assistance of heaven . . . . be held in this assembly every morning" was not put to a vote.

Radiators painted white give twenty per cent more radiation than unpainted ones. Other colors in order of their radiation values are cream, red, green, yellow, black, aluminum and brown.

Measuring only three-quarters of an inch high, the smallest camera in the world has been presented to Queen Mary of Britain, for the Queen's Doll House.

The laws which permitted executions by the axe were not repealed until 1747.

The oldest shoe factory in the country has gone out of business. Since 1762 the shop founded by James Benedict has continued under ownership of his descendants to produce the celebrated New Canaan handmade shoe, which for a century enjoyed the largest sale of any factory footwear. It is said that the competition of machinery, which the House of Benedict refused to install, is responsible for the factory being closed.

There is a fortnightly airplane service between Palestine, Egypt and Bagdad.

How the Bonus Is "Granted" But Not "Paid"

The Superb Trickery of Financial Bookkeeping Never Better Illustrated

By AARON HARDY ULM

A MAN says that you owe him five hundred dollars. "All right," you say, after long hesitancy, "if you insist that I owe it I'll have to admit the obligation."

"How about paying it?" the man asks.

"Oh, that's quite a different matter," you reply. "If I were to pay it and be done with it, I'd have trouble with my wife, for I'd have to cut her allowance. Besides, payment now wouldn't be best for you."

"Well, then, what are you going to do about it?" the claimant demands to know.

"I'll give you a note calling for payment at the end of twenty years, or sooner in case of your death," you suggest.

"But you have owed this sum now for six years," retorts the claimant.

"If you will let me owe it for twenty years more, I'll add twenty-five per cent to the amount I agree to pay," you propose.

"How about interest?" he asks.

"That will be allowed, too, at the rate of four per cent compounded annually. Thus when you collect you will receive more than twice what you claim now. Meantime I'll be free to do a great deal more for you; perhaps I'll give you some cash as well as owe you this debt—you can never tell."

"Isn't that a rather involved and costly way of handling the matter?" he asks.

"Possibly, but you must not forget the wife. She has no great objection to my granting your claim but she probably would throw me out of the house if I undertook to pay it now!" you reply.

"So you have figured out a scheme whereby it is made to appear that I get much more than I ask for and at the same time your wife's allowance is not disturbed," he remarks.

"Exactly, and it is a beautiful scheme," you affirm. "Let me illustrate.

"Here's one book. At the beginning of each year I'll make an entry in it indicating that I have taken out of my left-hand pocket a sum of money to be put into my right-hand pocket and saved for the purpose of paying your claim.

"Here's another book. In it there will be an entry showing that this money was then taken out of my right-hand pocket and invested in interest-bearing notes which are kept in my inside coat pocket."

"Whose notes?"

"My own. They will be owned by me and payable to myself. As I collect interest on them—from myself—and pay it to myself I'll invest the earnings in more of my own notes. These earnings will amount to about one-third of the amount to be paid you in the end.

"These being my own notes, it will be apparent to you that by this method I can save the money and spend it, too: both the principal and the interest. So the carrying of this obligation need cost nobody anything—except for looking after the details."

"But at the end of twenty years," the man you owe says to you, "instead of owing me only $500 as claimed now you will owe me about $1 200. All that you will have to pay it with will be collection of your own beautifully engraved notes. Meantime, you probably will spend $500 or more on the bookkeeping."

"Again let me insist," you conclude, "that the wife's attitude be not overlooked. She doesn't see it that way."

"But in time she may," you are told.

"Oh, no; by that time there will be another wife," you declare.

Picture the claimant as the veterans of the World War, the claimee as Uncle Sam and the wife as the taxpaying public and you will have in fable form the settlement of the bonus question as arrived at recently by the United States Congress.

The genesis of the scheme may be stated as follows:

1. The present Congress was determined to *grant* the former soldiers a bonus.

2. The present Congress was equally afraid to *pay* the former soldiers a bonus.

What the Bonus Will Cost

HENCE was adopted a queer medley of red tape and bookkeeping jugglery by which it is made to appear that the veterans will get more than they asked for and in a way that will be all but costless to the taxpayers.

Nowhere in the statute is the grant called a *bonus;* it is defined as *"adjusted compensation."*

Thus the bonus bill which was passed over the President's veto is predicated on the contention that all, from the rank of captain downward, who served in the American forces during the war, were underpaid.

It is not pertinent here to discuss the merit of this contention. The only purpose is to state how the claims, now legally conceded, are to be met.

The claims are for $1 a day for home and $1.25 a day for overseas service per person, over and above what was or has been paid to them.

These claims *if paid off in cash* would entail a direct outlay of *less than $1,500,000,000.*

As ultimately to be paid they will entail outlays of not less than *four to five billions,* and probably considerably more than that. In fact, as shall be shown, to estimate more than a minimum of ultimate cost would be futile. For many reasons, the cost of such undertakings usually goes beyond all advance estimates.

The estimates of experts vary to the extent of a billion or more dollars.

There will be two prime elements of cost. One is that of administration, the payment of salaries and other expenses incident to taking care of the details of the operation. The other is the funds distributed among the veterans or their beneficiaries.

An indication of what the first cost will be is indictated by the perceptible stiffening of the long-taut housing situation in Washington. Some persons went so far as to predict that additions to the population there on account of the bonus measure will bring about congestion similar to that which all but caused Washington to break down during the war. These no doubt are exaggerations. However, it is admitted that the government will have to increase its forces by 3,000 or more on account of the bill. Appropriations for these, as carried in the deficiency bill which on account of a deadlock failed of passage at the close of the recent Congressional session, amounted to nearly $5.000,000 for the first year. Though no appropriations were made, the work is going ahead anyway.

Some estimate that the total administration cost will be $10.000,000 or more a year. Unless the law is changed, which is very probable, the cost of administration should be much less after the first year or two.

It is equally difficult to forecast the amount of funds that will be needed for paying off the veterans or their beneficiaries. One reason is that the scheme of payment is quite complicated, and the other is that in all probability it will be elaborated and expanded from time to time. Hardly was the ink on the present act dry before far-reaching amendments were proposed in both House and Senate.

Methods of Payment

THOSE who are to be paid off in cash will receive only the $1 a day for home and $1.25 a day for overseas service. These are the ones, some 300,000 or more, who are entitled to payment for only fifty days or less. They are the ones who served not more than 110 days, as deductions will be made in all cases for the $60 extra payment made on discharge.

The "short termers" will be paid off in cash early next year, not sooner than March 1, as they apply. With them the operation will cease on receipt in full of the money due.

The strict $1 and $1.25 a day rule will apply in the cases of those who have died. These also number 300.000 or more. The money will be paid, in ten annual installments beginning in March of next year, to dependents only.

These payments and those to the "short termers" will involve an outlay of about $100.000,000, most of it distributed over a period of two and a half years beginning with next March.

The bulk of the operation has to do with the approximately 3,600.000 veterans who served more than 110 days and still live, and won't be paid off now in cash.

To them "certificates" will be issued. These certificates will call for the payment to them in 1944, or sooner, to their designated beneficiaries in case of death, certain sums, the amount depending in each case on several variable factors.

The base factor is the allowance of $1 a day for home and $1.25 for overseas service, less the sixty days covered by extra payment made on discharge.

But to make the certificates, in lieu of cash, attractive, the base sum will be increased twenty-five per cent, but in no case may it be more than $500 for home or $625 for overseas service.

Then this sum is multiplied by factors governed by the ages of the certificate holders. These age factors will be based on the actuarial principles followed by standard life insurance companies.

Succinctly, the full sum in each case will be the amount of twenty-year endowment insurance which the base sum would buy on an earning basis of four per cent.

The base sum will average from $325 to $350 but the average payment stipulated in certificates will be between $850 and $900. The younger the man the greater the difference between the two, as the insurance risk is less.

Now the government doesn't take the money which Congress holds is due the veterans and go out and buy insurance for the claimants.

Instead, it sets up a great insurance operation of its own.

Each year it proposes to set aside the funds that would be needed to pay premiums if these millions of insurance policies were taken out with established companies.

The funds, after payments due to deaths are made, will be treated, supposedly, as "reserves" in the manner that such funds are handled by standard insurance companies. That is, they will be "invested" with the view of their earning a considerable proportion of the payments ultimately to be made to the certificate holders.

The appropriations needed for this sinking fund or reserve will range, according to the latest calculation by actuaries handling the matter, from $119,516,775 for the first to $97,363.617 for the last of the twenty years. The aggregate will be $2,180,324,056. This does not include cash payments to be made to those whose claims are for $50 or less or those to be made in installments to the dependents of deceased veterans. Nor does it include the cost of administration.

The certificates, outstanding against these appropriations of $2,180.324,056, will call for, according to the latest calculation, ultimate payments aggregating $3,139,395,200, or almost one billion dollars more than will be appropriated from year to year. This excess supposedly will be increment "earned" by the funds while in reserve.

Will the government go out and loan this money or buy stocks and bonds of states, municipalities or corporations as the insurance companies do? Not at all.

The "reserves" will be "invested" in its own bonds.

That is, when the "premium" money is appropriated each year, the Treasury will buy from itself any bonds which it may happen to have for sale. If it has none for sale, the Treasury may go out and buy them in the open market.

These government bonds then are to be stored away in a government vault and held as "assets" to the credit of the bonus fund. As interest coupons mature they will be clipped, then cashed at another office of the Treasury and the funds thus collected by the Treasury from itself will be "invested" in more bonds bought from itself.

Thus does Congress propose to let compound interest provide about one-third of the money needed ultimately for redeeming the bonus certificates.

If the reserve funds be used for buying up outstanding bonds which otherwise would not be redeemed at the time, some savings in interest will be achieved through the process.

But this isn't likely to, though it may happen at last to some extent.

"In the first place," a Treasury expert tells the writer, "at the present rate of redemption there won't be three billion dollars' worth of Federal bonds outstanding at the end of twenty years unless new ones are issued. That is, if these funds are invested in government bonds alone we may have to issue bonds for that purpose alone. This clearly would be a ridiculous and merely a dog-chasing-his-tail procedure."

No bonds are likely to be issued ostensibly for that purpose alone.

What will happen is that the "good market" thus provided will be an incentive for the issuing of new bonds ostensibly for other purposes.

In any event the result will be essentially the same. The government will accumulate reserves in the form of its own debt obligations. Funds for interest payments must be provided by the government itself. At the end of twenty years the government, instead of having a reserve of more than three billions in cash with which to meet the matured obligations due then to living veterans, will possess more than three billion dollars' worth of its own obligations, which, to realize from them real money to give to the veterans, will have to be sold. The government then will owe to others, the buyers of the bonds, what it pays in the end to the bulk of the veterans. Succinctly, the government will owe the money to itself for a period of twenty years and then to get the money it will have to borrow it from others, or raise the full amount at one time in taxes. Thus the wizardry of bookkeeping will cause the paying of the obligation to be *deferred*—and *more than doubled* in the process. And the cost of this bookkeeping jugglery will probably amount to more than the original obligation.

Meantime, the problem is left largely in the air, subject to more agitation and more playing of politics, leading very probably to elaborations and additions which may carry the ultimate cost beyond what anybody now would dare predict.

Endless Chain of Red Tape

WHAT will the claimants get out of it? That remains to be seen. Under the present arrangement the living claimants who are entitled to more than $50 can get nothing until they die or the expiration of twenty years—barring, of course, what they borrow from private agencies on the government certificates they will hold.

After two years the certificates will be legal collateral for private loans by banks. These loans must be limited to ninety per cent of the reserve worth of the certificates. On a $1,000 certificate $87.93 may be loaned by any obliging bank at the end of two years. The loan value of the certificate will increase at the rate of about $40 a year.

If the certificate holder does not take it up, the unpaid note given, with the certificate as collateral, for a loan, may be sent by the holding bank to Washington, where it will be paid. The loan then will be carried by the government at a flat interest charge of six per cent. Interest charged by the bank must be limited to two per cent above the Federal Reserve discount rate at the time, which means a gross rate of six to eight per cent.

The loan feature, like other parts of the arrangement, will involve immense detail, calling for the employment of a large number of persons.

Thus in order *to grant but not to pay,* the present Congress has set up an endless-chain scheme of red tape, figurative investments, figurative interest earnings and ramifying loans and borrowings, for passing on to the future, greatly augmented, a burden which it pretends to shoulder but does not.

With the Submerged Nine-tenths in China

Coolie's Smiling Tolerance of Adversity

By CARROLL K. MICHENER

CHINA, at first glimpse, seemed to us the mother country of the world's squalor and want. It was malodorous. Poverty whined and festered by the roadsides. Hunger staggered by in every street. The entire energy of the great visible population seemed bent upon averting momentarily the imminent clutch of starvation. The poor, the ragged, the desperate, were everywhere. Where, we wished to be told, were the silks, porcelains, the vast accumulated treasures with which the world's commercial imagination had always endowed this Queen of the East?

The riches were there, of course, though we did not see them at first. They were behind walls, hidden like jewels in the recesses of temples, amassed in fabulous pawnshops and warehouses, collected behind the towers and gates of forbidden inclosures. But the poverty was visible. The antithesis of wealth was all that was apparent. It seemed like a curse, like a racial disease, spread over a chastened populace.

Not one, but nine, were the tenths that appeared to be submerged here in China.

It was long before we discovered that, just as all that has glitter is not gold, so, in China, all that is devoid of ostentation and elegance is not poverty. Nevertheless, we could not escape the conviction that wealth was of the few, and that most of China's millions belonged, not to the more fortunate classes of scholars and merchants, but to the ranks of artisans and laborers. China, by law of average, was, per capita, a land of the poor.

But if the "submerged nine-tenths" of all Chinamen were without wealth, they most certainly were not to be called devoid of contentment. This was the most amazing of our Oriental discoveries. To be poor in America, we had been cynical enough to believe, was synonymous with unhappiness. At the very least it was a symptom of social unrest. The splendid old copy-book philosophy concerning the simple virtues of poverty had never seemed to us to be accepted with any great amount of sincerity. But here in China the poor smiled. Indigence appeared to consider itself a virtue: at any rate, it did not foment revolutions. And poverty caused no evident loss of caste, for it had plenty of company.

The gaunt rickshaw coolie who ran with us from the boat landing to our Shanghai hotel, leaving behind him a trail of mingled garlic and sweat, had the hardihood to smile at the end of his panting journey. His eyes were glassy with Central China's humid heat, his head was bald to the blistering sun. He ran barefoot, not with the easy swing of an athlete, but with his calloused soles thudding in a bone-shocking heel-and-toe fashion over the fiery pavements. He had but a tatter of clothing about his loins, and the skin of his uncovered bust was bronzed and leathery as a "varnished" duck swinging in the wind before a Chinese meat shop. The ribs rippled under its surface. He was evidently overworked, under-nourished, and without future, save for the certainty of an early physical decay and a miserable death. Nevertheless, he could smile.

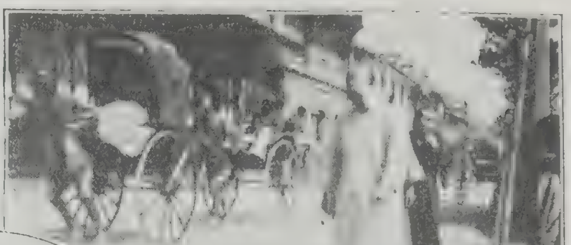
That first rickshaw excursion gave us a sense of monstrous complicity in an assault upon the dignity of man. We had pulled the *genus homo* backward a long step toward the place of beasts; had helped him to descend to such a position of humility as had not been his even in anthropological dawn when he was most like an animal.

This was a feeling, however, that could not survive in the Orient. Man, there, had subjected himself to a thousand indignities in the struggle for existence. There was nothing, short of crime or dishonesty—and there was little of either—that he would not do for a handful of rice. Compared with the Chinese coolie's status of economy, the American laborer was a veritable monarch. But in his philosophies of life, his smiling tolerance of adversity, it was the coolie who was king.

Life, to the downtrodden of China, seemed to appeal to them as some sort of game. Humor, somehow, had to be squeezed from the very dregs of it. Laughter appeared to us everywhere to be ready to spring to the drab surface of things. The Chinese coolie was responsive at all times to a twist of whimsicality. Unlike the serious, self-conscious, over-sensitive Japanese, he could laugh as readily at himself as at the predicament of another.

We heard it said, attested by *taipans*, those foreign merchants who have spent lifetimes in China, that there was one sure way to avoid threatened unpleasantness from a Celestial mob. Crack a joke, make yourself or an assailant ridiculous, and all would be well. The ignorant malice, the misunderstanding of the moment, would dissolve into laughter.

For this we could not vouch from any experience of our own, but we learned that a smile was always readier currency than a frown—in spite of the prevalent Anglo-Saxon theory that the whack of a walking stick and the attitude of solemn, unbending, lofty superiority were the only practical amenities in dealing with natives.

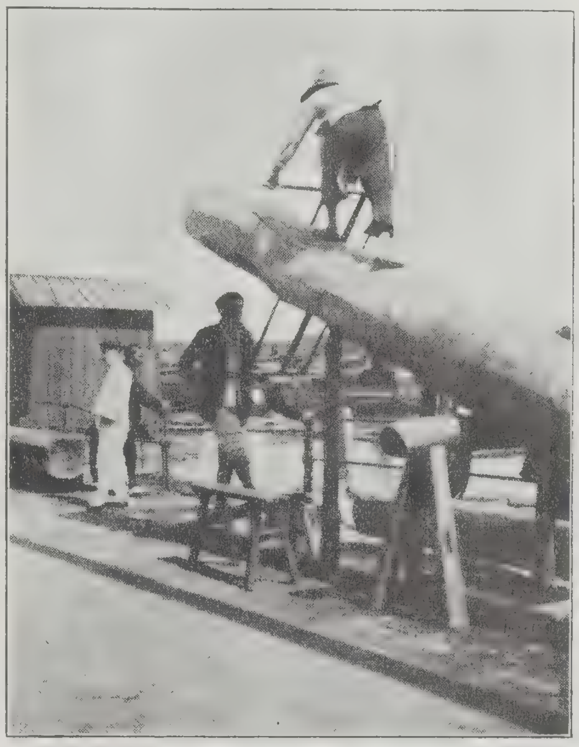


The endless stream of coolie traffic, Shanghai.

Laborers in the flood and drouth district of North China

We wandered through the rabbit-warrens of the cities; through noisome alleys that were none-the-less main thoroughfares, with shallow exposed sewers longitudinally bisecting them; through swarming boat cities that were anchored to "streets" of narrow planking upon bamboo supports; through temple courtyards alive with dogs, petty merchants, fortune tellers and beggars. The beggars were diseased and purulent, sometimes by design, for there is a beggars' guild which lifts the calling into a recognized profession and teaches the art of mendicant make-up. And there had been a recent period of consternation, we were solemnly assured, over a beggars' strike! Fortunately the cause was speedily removed, otherwise merchants in the quarter affected would have faced inevitable business depression owing to lack of the usual opportunity for attaining merit through alms.

Even the beggars were susceptible to humor. It was easier, we discovered, to escape the whining and fawning, the panting pursuit beside a rickshaw, the pawing of hands unspeakable with filth, the touch and odor of noisome rags, when the mendicant's attention was diverted momentarily from his "business" to some object of ridicule or mirth—most effectively himself.



A Chinese "lumber mill."

But aside from the beggars, we saw no hint of self-pity. The poor went their hard, uncomfortable, squalid way without self-derogation. These words of a sinalogue were confirmed for us wherever we strolled (1):

"To do him justice, the Celestial asks for none of our pity. Despite the ever-present specter of hunger—because perhaps of the very lessons it teaches him—there is in him little of the sorrowful countenance and nothing at all of the intolerable ennui wherewith the heirs of all the ages have purchased knowledge. It is a cheery soul, *bon enfant*, even where an unconscious race antipathy makes him wary; possessed, moreover, of a kindly and gentle humor, racy of the soil and wise with all the ghostly wisdom of his past. This humorous quality of the man is that which brings him nearest to our sympathies; no doubt it is also that which enables him to accept life with such *bonhommie* and good grace. No collar-grinning yokel humor his, but the precious faculty of seeing the incongruous in life and in himself, of hearing the Lohan's laugh amid all the growlings of the thunder-god. Few Chinese peasants are so cross-grained that they will not spare the time to crack a joke at your expense or their own: in the village elders and story-tellers you will often find the qualities of Scheherazade and Sancho Panza combining to produce a very pretty wit and nimbleness of repartee. And, withal, these people have certain things that we, with all our superiority, may well envy—the faculty of contented industry, of finding joy in simple household things. Let us not too greatly pity them."

And this from another of the great interpreters of the East (2): "Perhaps it is in time of sickness that the innate cheerfulness of the Chinese disposition shows to most advantage. As a rule, they take the most optimistic view, or, at all events, wish to seem to do so, both of their own condition and of that of others. Their cheery hopefulness often does not forsake them even in physical weakness and in extreme pain. We have known multitudes of cases where Chinese patients, suffering from every variety of disease, frequently in deep poverty, not always adequately nourished, at a distance from their homes, sometimes neglected or even abandoned by their relatives and with no ray of hope for the future visible, yet maintained a cheerful equanimity of temper, which was a constant albeit an unintentional rebuke to the nervous impatience which, under like circumstances, would be sure to characterize the Anglo-Saxon."

China is predominantly an agricultural nation. Four-fifths of its populace are said to be farmers. Though they are thrifty, wealth among them is rare. And yet, possibly because of fertile, productive environment, they do not suggest poverty; possibly, too, this is because of their unfailing, calm philosophy of life. It was in the cities, at any rate, that the poor seemed to us poorest. There, squalor was intensified, miasma was concentrated, the struggle for existence was most bitterly acute.

For us, the city of boats, just above Shanghai—a coolie suburb, so to say—came to be a symbol of China's indigence. But even this place lost, after a time, its less wholesome significance. The Chinese coolie inhabiting its cheerless environs did not appear greatly worried about himself. Why should we worry for him? It didn't matter so much about this life—there was another to come.

Thenceforth we were less conscious of the poverty, more of the salutary industry of China. That became the significant fact. In it lay the old economic bogey of the Yellow Peril. The Chinaman was the great worker of the world.

Celestial contentment, we were convinced, meant no lack of ambition. It inferred no slothful satisfaction with things as they were, and no absence of a desire to better the individual's condition. It was rather a reluctance to abandon the system under which China had become what it was.

Above all, it was fatalism. We had read much in the Chinese classics about the "decrees of heaven." And there appeared to be a great deal in popular speech echoing this notion. The friends of a coolie who went to sleep between the ties, with his head upon a steel rail—not wholly dissimilar, after all, from a Chinese pillow!—said philosophically after the express train had passed and they were viewing the remains, that this was "his fate." So,

(*Concluded on page C*)

A rickshaw coolie at home in the boat-city at Shanghai.

How One Man Preserved the History of the West

By FRED L. HOLMES

LONG rows of well-bound scrapbooks, with pages oversealed with coverings of the finest silk, preserved in the fireproof vaults of the State Historical Society of Wisconsin at Madison, tell the story of the rise of the West.

Hundreds of scholars come annually to examine these faded pages. So familiar has the collection become, that it is cited in the hundreds of volumes which have been written to show the rise and expansion of the Ohio and Mississippi valleys as a social and political force in the development of the nation.

To this shrine as a scholar came Theodore Roosevelt to consult the great collection when he was preparing his now famous volumes, "The Winning of the West." Material gathered from these original documents helped to heighten the historical prestige of the late Dr. Reuben Gold Thwaites and Professor Frederic Jackson Turner, of Yale, who is now generally recognized as the foremost scholar in this country on western history.

Emerson's statement that every great institution is but the lengthened shadow of a single man has a true application when the value of this great collection of original source material is considered. This archive is the result of the industry of Lyman C. Draper, after whom the collection is now named. In the days when he was gathering this material he was the friend of such eminent historians as Francis Parkman, Jared Sparks, George Bancroft and Benjamin Lossing, names to conjure with as scholars of their generation. They urged him on in his work and when he faltered under his heavy task, it was their kind advice and encouragements that stirred his weary spirit to renewed industry.

It was by natural instincts that the youthful Lyman Draper came to his love of the story of the borderland. Around his father's fireside in Lockport, New York, a century ago, gathered the participants of the Revolutionary War, all recounting stories of exploits and deeds of heroism. His paternal grandfather was a Revolutionary soldier and his closest relatives had served in the War of 1812. When he was a lad of ten, he saw Lafayette on his last visit to the United States in 1825 and the impression made upon his mind never faded from it. Upon this canvas as a background he was to paint his own career.

There early came to him a determination to save from oblivion the records of the many achievements which the fast disappearing generation about him had experienced.

Living on the Erie Canal, he came in contact with a panorama of important personages who traveled into and out of the West on this route of travel.

He came to know Lewis Cass, governor of Michigan and later a prominent figure in history; De Witt Clinton and many famous Indian chiefs, whose stories fired his youthful fancy. When he was nineteen years of age he went to Denison University at Granville, Ohio, but was early required to withdraw because of a lack of funds.

Soon he became obsessed with a single idea. He wanted to write the biographies of the famous personages of the West. The men of the borderland were his heroes of action. Books already published on these characters, when tested by his own knowledge, were found to be faulty in information and inaccurate in description. At once he began a correspondence with leaders all along the settlement fringe. These letters began in 1840 and continued until a few days before his death in 1889.

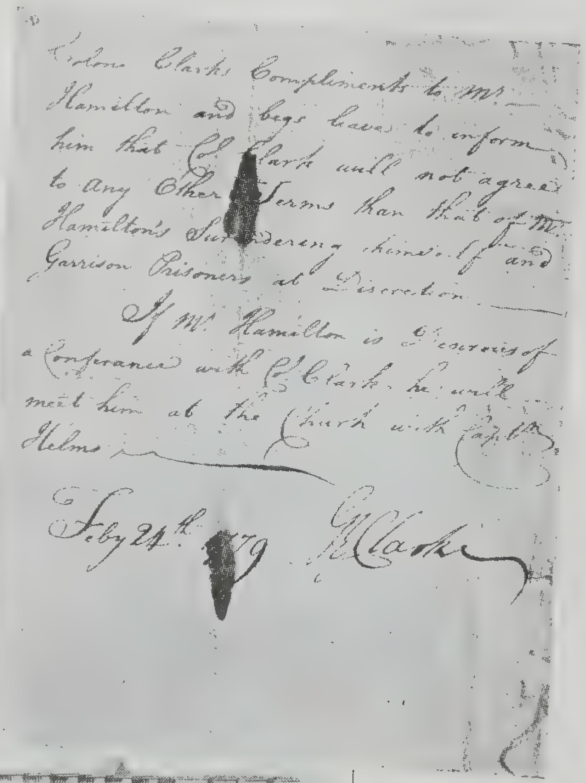
Answers came slowly. Years were passing. So a new plan was conceived. He began personal visits to the homes of pioneers, often staying weeks in a community, until all the information had been collected; all the old letters had been gathered; the reminiscences of every historical character written out.

Some of these trips were made on foot; some on horseback. There were few railroads. In all he traveled 60,000 miles "meeting with hundreds of curious adventures, and hairbreadth escapes by means of runaway horses, frightful storms, swollen streams, overturned stages, snagged steamboats, extremities of hunger and the like, yet never injured nor allowing any untoward circumstance to thwart the particular mission at the time in view."

On most of these trips he spent the nights at the humble homes of the pioneers. There were few taverns in those days, but the best were not so good as the worst of our own time. Around the fireside of his host the curtain of the past was lifted and the intimate story of struggles with Indians, hardships in the burned clearings were again revealed in true colors.

Out of these travels came a storehouse of invaluable historical information. Told that he was planning to write the story of the frontier, with the biographies of a more than a score of its participants, the pioneer homes were ransacked for documents which would aid him. Letters from participants in border skirmishes, stories of the achievements of others who had pushed the line of settlement a little farther into the Mississippi Valley; diaries of the old folks, account books and other family documents were all gathered.

After this original source material had all been garnered, days were still spent by the tall, thin-faced, inquisitive scholar, learning from the lips of his host all the bits of scattered information and recollections which might be of importance to him, when later he would start his task of writing. He copied baptismal, marriage and death reports from old church registers, made transcripts of old land deeds and only left the community when he felt that nothing of historical value remained for him to gather.



Colon Clarks Compliments to Mr Hamilton and begs leave to inform him that Col Clark will not agree to any Other Terms than that of Mr Hamilton's Surrendering himself and Garrison Prisoners at Discretion —

If Mr Hamilton is Desirous of a Conferance with Col Clark he will meet him at the Church with Captn Helms —

Feby 24th 1779 G R Clark

Above—Clark's letter to Hamilton.

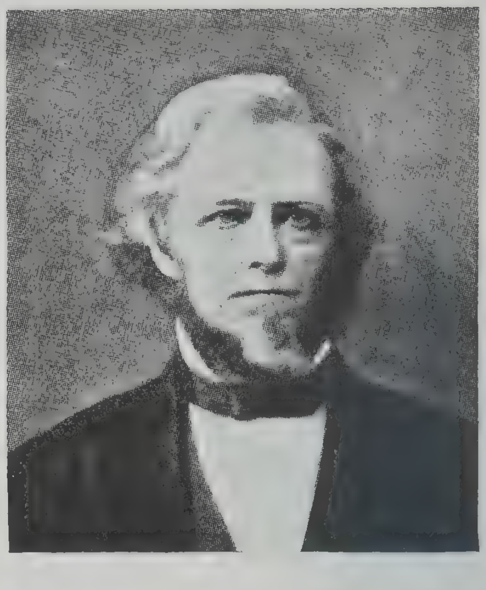
At left—The State Historical Library Building at Madison, Wisconsin, where the big manuscript collection of documents on the West are now housed.

Years followed and still his travels were continued. He held long interviews with the leaders under the daring Indian fighter and hero of the Northwest, George Rogers Clark; with George William Hall, a field officer under General Andrew Jackson in the Creek Indian war; with the associates and descendants of Boone, Kenton, Sumner, Sevier, Robertson, Pickens, Crawford, Shelby, Brady and scores of others who had played important rôles in the Indian forays of the Ohio Valley and the South.

From the Indian chiefs and their survivors he gathered material. His notebooks are replete with interviews with leaders of the Wyandots, Delawares, Tuscaroras, Senecas, Oneidas, Catawbas, Potawatomis, Chickasaws and Shawnees. So eager and persistent was he in the gathering of information that the descendants of the famous Mohawk chief, Joseph Brandt, gave him an Indian cognomen signifying "The Inquirer." During Dr. Draper's lifetime, he saw Henry Clay, Andrew Jackson and William Henry Harrison, although interviews were not obtained from them.

It was in the midst of these activities that through the influence of his friend and college classmate, Judge Charles Larabee, that he was invited to come to Wisconsin in 1852 to become secretary of the recently formed Wisconsin Historical Society and act as its secretary at a salary of $500 a year.

Still continuing his work of collecting valuable documents and old papers, Dr. Draper, early in 1854, made a contract with Mr. Lossing, the historian, to produce biographies of Boone, George Rogers Clark, Brady, Kenton, Martin Crawford, Harmar, St. Clair, Wayne and a number of others. Notice was given out that the material upon which he had spent years in collecting was about to be welded into readable form. Three years passed and there were still no books. Dr. Draper became a procrastinator.



LYMAN COPELAND DRAPER, LL.D.
First Secretary of the Society, 1854-1886.

For nearly twenty years Dr. Draper had been collecting manuscripts. But he was never able to set to his task of writing. Always he was waiting for another day. Some letter was out, which had not been answered and he feared that new information might turn up, which would change the course of his series. While he had gathered documentary evidence as a basis for the big broad outlines for the task before him, he now delayed for the gathering of details. By 1857 Dr. Draper computed that his material "comprised 10,000 foolscap pages of notes of the recollections of the warriors, pioneers, either written by themselves or taken down from their own lips; and well-nigh 5,000 pages more of original manuscript journals, memorandum books and other letters written by nearly all the leading border heroes of the West." As the years passed this collection was greatly increased in volume.

Little was published by this great manuscript collector. He completed some twenty chapters of a life of Daniel Boone; published a volume giving the detail of the battle of King's Mountain—the episode which saved the southern colonies from falling into the hands of the British in 1780—and a number of fragmentary historical articles.

Unique in the manuscript collection gathered by him are the many volumes of notes and papers on the "Mecklenberg declaration." This was the controversy that raged for many years over the true source of the Declaration of Independence. Scotch-Irish patriots in Mecklenberg County, North Carolina, at a meeting on May 31, 1776, asserted in formal action that the action of the English Parliament had "annulled and vacated all civil and military commissions granted by the crown and suspended the constitutions of the colonies" and that "the provisional congress of each province, under the direction of the Great Continental Congress, is vested with all the legislative and executive powers within their respective provinces, and that no other legislative or executive power does or can exist at this time in any of these colonies." These bold resolves were carried by the North Carolina delegates to the Continental Congress but were never presented.

About twenty years afterward a difference arose over the authorship of the Declaration of Independence. It was claimed that the document of July 4, 1776, preserved in the Washington government archives in the hand of Thomas Jefferson, was taken from the files and notes of the Mecklenberg meeting. Some there were who claimed that the famous declaration was drawn up and presented at a meeting as early as May 20 of that year. This controversy raged for years, and it was because of the intensity of the feeling over it that Dr. Draper made his famous collection of letters and documents from all persons who claimed to know anything about the subject.

Almost annually there comes to the Wisconsin Historical Library some person from the South to investigate these documents of years ago. When the dispute was at its height, the charge was openly made that Thomas Jefferson had practiced a plagiarism and that the Mecklenberg declaration was the basis and almost the exact working of the latter's historic document.

Within the past year, two North Carolina lawyers on their way to attend the meeting of the American Bar Association at Minneapolis stopped at Madison to spend a week in examining all of the Mecklenberg evidence. After days of search they came across a letter written by their grandfather, whose relatives were the lineal descendants of a participant in the North Carolina convention. The letter repeated the story. It voiced the opinion that there had been some mistake about the matter and declared that while the Mecklenberg farmers were the first formally to throw off the yoke of bondage, yet the final document, attributed to Mr. Jefferson, had never been presented to the Mecklenberg convention.

"My grandfather was mistaken," declared one of the lawyers. "I am sure about it. I am still convinced that the July 4th document was the original declaration of Mecklenberg."

John Fiske, the distinguished historian, discounts the

(Concluded on page 5)

How One Man Preserved the History of the West

Concluded from page 4

Mecklenberg idea. He reached the conclusion that "the Mecklenberg declaration is simply a legend based upon the distorted recollections of the real proceedings of May 31."

Moreover, this conclusion has been reached by other historical investigators who have examined the famous Draper collection. Nevertheless, North Carolina has never acquiesced and an annual celebration over the event is still held in Mecklenberg country.

All sorts of other material on the Declaration of Independence was gathered by Dr. Draper and he collected a mass of data including the signature and biographical information on every one of the signers of the July 4th document. Even with all this source material he delayed writing.

He was never ready to go to work on the evidence which he had collected. While acting as secretary of the State Historical Library, he built a brick study, still standing in a back dooryard of one of the principal streets of Madison, with an entrance at the rear of the building, where he kept his manuscripts. The out-of-sight entrance was to keep people from disturbing him in his work. In this building he stored his material, which upon his death became the property of the historical society.

"I have wasted my life in puttering," he would often declare to his successor at the library, "but I can see no help for it; I can write nothing so long as I fear there is a fact, no matter how small, as yet ungarnered."

While this collection of original documents was under way, he was gathering a rare collection of books for the State Historical Library. From its first collection of less than one hundred volumes, when started in 1849, the collection has now grown until it numbers more than 201,000 volumes and 209,000 pamphlets.

Home of Draper Collection

AFTER the death of Dr. Draper the state erected a State Historical Library building for the housing of the large collection of books and original manuscripts. This building was reared at a cost of nearly $1,000,000. Besides the historical collection it houses the library of the University of Wisconsin and other book collections making a total of 450,000 volumes and 261,000 pamphlets under one roof.

Without the Draper collections the true history of the West could never have been written. A score of volumes has been published with these documents as the basis. So far the material has only been partially utilized.

When Reuben Gold Thwaites came to write, a few years ago, his biography of Daniel Boone, he found much of his material gathered in the Draper collection. The Boone collection is most interesting. Not only are there many documents giving intimate details of the life of the trapper and brave pioneer, but letters are to be found in Boone's own handwriting.

Paging over these faded manuscripts recently, I came across one written by Boone from Missouri, October 17, 1816, to his sister in Kentucky in which he gave his religious beliefs. Coming from a grizzled woodsman, it is a curious document. Mr. Boone wrote:

> "Relating to our family and how we live in this world and what chance we shall have in the next, we know not. For my part I am as ignorant as a child; all the religion I have, to love and fear God, believe in Jesus Christ, help and trust in God's mercy and I believe God never made a man of my principles to be lost."

To the people who now live in the states which then were called the Northwest Territory, there is in the George Rogers Clark file of the Draper manuscript collection, a document of great importance. It tells how Clark saved the Northwest for the Revolutionary Cause. Clark was moving against Henry Hamilton, the British commander at Vincennes. After two hours of fighting on February 4, 1779, Hamilton sent a peace flag and requested a truce for three days. It was then that Clark sent his famous note demanding unconditional surrender. This document in the handwriting of Clark is in the Draper manuscripts:

> "Colonel Clark's Compliments to Mr. Hamilton and begs leave to inform him that Col. Clark will not agree to any Other Terms than that of Mr. Hamilton's Surrendering himself and Garrison. Prisoners at Discretion.
>
> "If Mr. Hamilton is Desirous of a Conference with Colonel Clark he will meet him at the Church with Captn. Helms.
>
> "Feby. 24th, 1779. G. R. Clark."

According to Dr. Thwaites the capture of Vincennes signalizes one of the most notable and heroic achievements in American history.

"Clark had conducted a forced march of about two hundred and thirty miles through almost unheard-of difficulties," declares Mr. Thwaites. "With a small party of ragged and half-famished militiamen, nearly half of whom were Creoles, he had captured, in the heart of a strange and hostile country, without the aid of his artillery, a heavy stockade mounted by cannons and swivels and manned by a trained garrison. It was a bold scheme, of his own planning, and skillfully carried out. At his back were some of the best fighting men on the border, but with him rests the principal credit."

Since the death of Dr. Draper in 1889, the true value of the collection made by him has come to be prized by historians.

The World's Glass Eye

By WILL LEVINGTON COMFORT

When the author tells of looking through the world's eyeglass he speaks from experience, for he has peered through that glass. While Will Levington Comfort is best known for his novels, among them "Routledge Rides Alone" and "This Man's World," and short stories, it will be recalled that he served in the cavalry during the Spanish-American War; during the eventful year of 1899 was war correspondent in Japan and the Phillipine Islands, and during the Russo-Japanese War was correspondent in Russia and Japan.

TWENTY years ago, the world was a great dim place to most of us young newspaper folk. We looked about in vague confusing light. There were still dark continents and we sought them, followed remote "blood-streams," lingering over patches of sick tissue . . . . finally stepping ashore in London or New York or San Francisco with a handful of motionless photographs to sell, a story to tell, something the "big papers" had to have.

In the Imperial Hotel in Tokio, Japan, 1904, waiting to go out with the columns of the Japanese army to fight the Russians in Manchuria, were fifty great men—see-ers of the age, the American, English and Continental war correspondents and artists—several who had lived through a dozen or more campaigns. I remember the awe that took me at the thought of what their eyes had seen—Greek and Crimean fighting, Balkan, Levant, Sudan, South Africa and Peking. Our own Richard Harding Davis was there, and John Fox, Jr., Palmer, Bass, Little, and the English war-writer around whom Kipling made his memorable Torpenhow, in "The Light That Failed." Dwelling in the auras of these great men, listening to their stories, watching them eat and drink and laugh, I felt then that they had seen it all—that I unluckily had been born into a world hopelessly civilized and unromantic.

Even the few scattered bits of action of the Russo-Japanese War, which fell under my camera and naked eye in the following months, did not break the idea that the world was considerably toned down; but late years at home have changed all that.

Recently at a picture show I studied the agony of the Near East in close-up, middle distance and background—refugees running in all directions with their goods, fleeing from fiery towns, half-covering their dead on the way—the starving and panic-stricken of a modern man-made devastation, following the rumors of bread like the passionate Quest of the Grail—more action than I had ever seen in a year afield.

From an airplane the great city of Islam was flung out—palaces and mosques of Stamboul, St. Sophia, Golden Horn, Sea of Marmora; and swooping low over the shipping of Bosphorous, I peered down through the airman's lens upon a nest of gray eggs on the water—the British fleet sitting tight in that hatchery of doom. I was presently in the palace of the Sultan; in the throne-room of the palace, I watched a new Sultan replacing the old, taking his oath, saluting his officers. Outside afterward, still looking through the world's glass eye, I studied the pawns of the new Sultan, even the beggars of the street, the teeming humans stopping to pray at the muezzin's call—lords of life and death in Islam . . . .

Years ago, after hearing Marquis Ito of Japan answer a few questions that another man asked, I felt enhanced in myself and important to the public; years ago in a nipa shack of Luzon, up Tarlac way, I bushed down for the night in the same room with General Joe Wheeler. "Here she is," thought I, "fame at last." I hoped I wouldn't snore and spoil the little Confederate cavalryman's rest. Last night I saw Clemenceau, Lloyd George, Lord Curzon, a group of Kermalists, some Japanese elder statesmen. Leisurely, so I'd know them again, they became my familiars through the glittering monacles of the world.

Also, within the same hour, I saw a little naked child, a thing of twisted bone, the color of dirty water. When he breathed there was a hideous bulge in his abdomen, his pitiful little chest seemed two-thirds dead—hips and knees filled with pus. No human horror from the African rivers, or the farthest Malayan Isle, but a child right here in America in advanced stages of tuberculosis—being shown by his doctors and nurses to stimulate the giving spirit in the matter of buying health-stamps.

The Spell of Jungle Film

NOBODY fainted in that black hall; nobody cried out. I sat wondering how they dared show such a picture; indeed I wondered if it could even be written about. Yet I suppose few even remember the little dying boy propped up by his nurse's hands . . . .

Was it because I have waited weary hours in a foreign port to have an invitation ratified to go aboard a battleship to interview an admiral, that I saw that British fleet from the airplane with different eyes than the blasé schoolboy at my side? Was it because I had seen the sick and naked and starving on the Pasig's banks and the shores of the Yellow Sea, that I felt soft as a coddled egg about that little specimen of the white plague?

There must be something to this, because the blasé schoolboy at my side started violently and a hiss of breath broke from him during the comedy, when an automobile went over the bank. That struck him where he lived, here at home, keyed to his father's car, perhaps. . . . So we must each pay a price for what we get out of a book or picture, not the net price on the wrapper alone, or the price of admission to the show, but the price of personal experience. It is perfectly lawful to buy a saddle-horse, but a man cannot really call it his, unless he's a horseman. So it's really true that one must have given himself to adventure, to travel, to mountain and desert and danger—thrust his life into the red-tipped forks of sensation—really to turn the pages of the modern picture book.

Years ago in Pittsburgh, I used to spend hours before the cages at the zoo; before that in Central Park, New York; after that in Lincoln Park, Chicago. One day in a sick revery, looking down upon the one-eyed crocodile in the pool of the Battery Aquarium, I became acutely aware of the ancient past of man and of foul nests of fear still tangled in my own psychic viscera. Another time I looked so deeply, saw so much, in the slow drama of rat and rattlesnake, that for a few days I hated life in a world that contained such grim enactments.

To one who found memorable life experiences in these small drab affairs, can you fancy the thrall of the African and Indian hunting and jungle pictures? Recently I fell under the spell of jungle film—daybreak, an African hunter's camp, two ghostlike zebra, mathematically alike, standing in a wet fog, on either side of a great tree, like two phantoms freshly emerged from a nether plane. Softly they limned before my eyes—an artistic fulfillment in photography like the best of the Puvis de Chavannes decorations . . . . and a dance of goat-like deer, as if the pipes of Pan were playing . . . . a life or death shot that saved the camera man from a charging rhino . . . . a battle to the death of lioness and dogs. Any one of these was enough to go out to Africa for in the old days; any one was enough formerly to make a man significant in his home town.

A hyena, in name and nature, means a horror of the dark, a creature veiled in the shadows of the pit, cloaked in the stenches of malignancy. And here—shadowy among the shadows—a hyena circling an African hunter's camp. He stopped to claw down a raw hide of antelope, hanging out to dry; he carried it off. Day was breaking. We followed with the dogs. We came to the lair underground. The beast was noosed. In the midst of the tearing hounds, he was dragged out into the light. There he crouched in the full day, in the strange steam of his own putrescence, in the desperate intimacy of close-up . . . . and out of the lair afterward, the same "chawed" hide of antelope.

People about me got up and went out while that picture was showing, but I didn't dare move. In a sort of trance I waited for the "continuous" to bring that bit of film around again. Another moment of life.

All that's veritable in philosophy and religion unites on one point that experience is what we're here in the world to get. As youths we set out, leaving the warmth of our safe habitat—for experience. Later it comes to us . . . .

The Leper's Touch

A WHITE man reached home in America after rough days afield in China. One day he discovered a curious softening soreness on his hand. As he regarded the patch, his mind shot back—months before, the bank of a yellow river, the touch of a leper's body upon his own flesh! The ghastly conclusion swept over him. He sat down and covered his eyes against the end that awaited in months or years.

In the five days following, this man lived in imagination through all the horrors of fear and revolt that a Chinese peasant could possibly experience in the slow death of years from the disease itself. On the sixth day, fighting it out within himself, he touched the bedrock of a new courage. He had been hoaxed by his own fears; the sore disappeared. But it was a different man who lived on, a man who in extremity had uncovered a new kind of stuff in himself. He had met the shadows, and whipped them back. Thereafter he had more poise to bring to life.

Whether we like it or not, life shoves lesson after lesson before us. We may fail, but we cannot run away. Grade after grade we pass through and at each grade our fears and suspicions shrink back, our courage and sympathies reach up. Old cruelties of ignorance become obsolete as experiences mass . . . .

Vivid days here in the ever-speeding Now of 1924! Everywhere, in our midst, even yet, and scattered over the world, are the changed young men, silent young men often, eyes tortured from having seen too much. Shocks of experience came too fast. They returned from France or Flanders like walking dead men; they shivered at sounds we didn't hear. For a while we wondered if they were really better off than the ones who didn't come back. The blithe and buoyant thing we had known seemed left afield, ". . . . *He was talking to me, nursie—when he went,*" or something like that, we heard them mutter in their sleep . . . .

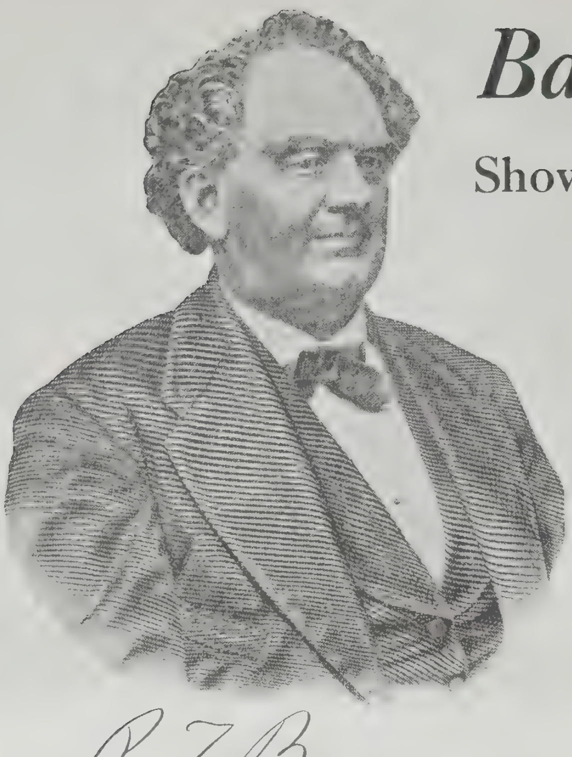
But all the time the assimilation of experience is going on; nature catching up, making substance out of shock, poise out of pain. And all the time we are being slowly forced to postulate a bigger unit of life than three-score-and-ten—to get it all straight.

I have nothing to say about screen drama in this—but in the gleanings of the black box in far fields, the very oil of intensive culture is contained for him who can see; all spread out for the eyes that already have seen much—the polished lens of progress penetrating purdah and death-cell, secret court and public square.

Barnum—"Prince of Humbugs"

Showman's Success Lay in Knowledge of Human Nature

By WALTER B. NORRIS



P. T. Barnum

PHINEAS T. BARNUM.

P. T. BARNUM'S description of himself as "The Prince of Humbugs" must be understood in the meaning he intended. He defined a "humbug" in a rhymed speech he made in 1864 as

> "Your true humbug's he, who as a host
> For the least money entertains you most."

In other words, he gave the public not what it expected but something which was worth more. He advertised that his museum was exhibiting the animal called Behemoth in the Book of Job; in reality he exhibited a hippopotamus, which may or may not have been the same animal. Anyway it was as great a curiosity, as it had never been shown in America before.

But Barnum was not a humbug otherwise. He was one of the most successful business men of his time; he accumulated two fortunes; he built palatial homes for his family; he was acquainted with all the prominent men of his day, was received at the White House, the courts of Europe, and was a force to be depended on in any public movement which was for the good of the community. He was thus an example of a successful man whose success was due to real ability, keen insight into human nature, hard, conscientious work, and right principles of living.

Barnum did not believe in working for another man any longer than one has to. He early left wage-employment and embarked in business on his own account. He started a newspaper, and he all his lifetime showed a native ability in using effective English—lost his money, went to New York from his home in Connecticut, ran a boarding house and a grocery store until when opportunity offered he bought the famous Negress, Joice Heth, supposed to have been the nurse of George Washington and then 161 years old. To do this he invested his entire savings of $500, borrowed as much more, sold his grocery store, and started on the road with his curiosity. Although the previous owner had lost money exhibiting her, Barnum got all his money back in one week's showing in New York and made considerable more before she died in a year's time.

This illustrates only one of Barnum's success-making qualities. Another equally important was his superiority in moral tone to his competitors. At the time that Barnum opened his American Museum in New York City and added dramatic entertainments to the attractions of the curiosities, there was no theater in New York which pretended to the moral cleanliness that Barnum insisted on in his establishment. In many of the others the gallery was the resort of the most disreputable men and women, and in some no woman was allowed in the orchestra unaccompanied by an escort. But Barnum's so-called "moral dramas," which were partly tableaux, were accepted by the most respectable New Yorkers, even by those who were opposed to the theater itself.

Furthermore, there was no appeal to sex in the curiosities exhibited. What Barnum appealed to was ordinary human curiosity, at times a bit morbid, as in such cases as the Siamese twins, the Fejee Mermaid, and the dwarfs, but with nothing suggestive in it.

It was this understanding of the normal man of his time to which Barnum owed his fortune and his fame. Everyone likes the unusual and the curious, especially in the animal world. The average man also appreciates a practical joke, and Barnum was the king of practical jokers. His scheme of indicating the exit to the museum by the cryptic words "To the Egress" arose partly because he wished to clear the museum on a certain Fourth of July so that more people might come in and swell the gate receipts, but it also had its origin in his realization that those who saw the sign, thought it the way to some new kind of bird or animal, and when they found themselves on the outside would value the joke more than the privilege of seeing another roomful of curiosities.

Personal attention to his business was another outstanding cause of Barnum's success. He frequently occupied the box office, appeared on the stage in emergencies, introduced numbers on the program, and even in his later days when he was a rich man frequently appeared in the ring at the circus. In fact so important a figure did he become that persons who visited either the circus or the museum were not satisfied until they had seen Barnum, although few went so far as the small boy who asked his father, "What cage is Barnum in?"

Barnum's success also contradicts the claim that a man should have no eccentricities if he is to be successful. His views on temperance were as extreme as any person's of his time. In 1847, while visiting Saratoga, he saw so much drunkenness among even the better classes there that he thereupon pledged himself to abstain from spirits. Later he became impressed with the dangers of moderate drinking, and one night solemnly descended to his wine cellars, in which he had taken considerable pride, and smashed all the bottles. The next morning he signed the pledge of total abstinence and secured more than twenty signatures from his friends. He even advocated prohibition by law and lectured on temperance on many occasions. The American Museum exhibited a group called "The Intemperate Family," and the Moral Lecture Room presented "The Drunkard" and other plays which showed the evils of intemperance. At the box office of the museum there was a supply of pledges awaiting signatures, and when Barnum found that his patrons were leaving the museum—where there was no bar—to get a drink between the acts, he stopped issuing return checks.

The greatest factor in making Barnum a rich man was, however, his development of the art of advertising. Barnum's methods smacked of the crudeness of his time, when the art was very young, as when he plastered the walls of the museum on the outside with huge pictures of the attractions within. But his genius showed itself in his arranging to have all these huge posters prepared secretly and then put in position during a single night. Thus when New York walked down Broadway to the Battery the next morning it was astounded at the change that had occurred.

Barnum's chief effort seems to have been to get his business talked about, and he did not care much even if the comment was unfavorable so long as it was undeserved. He realized that a dispute is always interesting, and the frequent charges that his curiosities were not genuine, as that the white whales which he exhibited were made of India rubber and then inflated, pleased him as much as would a column of praise. People came just to have a chance to judge the controversy themselves.

Another method of securing attention is oddity or mystery, and here Barnum eclipsed all his contemporaries. The story goes that at Barnum's orders a man one day placed a brick at each corner of the city block on which the museum was located and then solemnly proceeded to retrace his steps and shift each brick to the next corner. Once an hour he entered the museum and passed through before continuing his task. Naturally a crowd soon followed him as he worked and even paid admissions to enter the museum with him to see if there the mystery could be properly solved.

So tremendous a hold did Barnum, the self-made Connecticut Yankee, have on his generation that a half million copies of his autobiography, "The Life of P. T. Barnum Written by Himself," later issued under the title "Struggles and Triumphs," were sold in his lifetime. Mark Twain got up before dawn to read its pages as the best revelation of human nature in his day, and Barnum's stories and observations are still interesting reading to any student of human nature. Neither Barnum's services in creating the modern circus which still bears his name, nor the Museum of Natural History which he established at Tufts College and in which he deposited the stuffed skin of "Jumbo," biggest and most famous of elephants, will last as long as this book which reveals, at times unintentionally, the eccentricities, but also the secrets of success, of the man who was about as typical of his time as was Abraham Lincoln himself.

BARNUM'S ART OF MONEY-GETTING

Don't mistake your vocation.

Select the right location for business.

Avoid debt.

Persevere.

Don't get above your business.

Depend upon your own personal exertions.

Use the best tools.

Let hope predominate, but be not too visionary.

Do not scatter your powers.

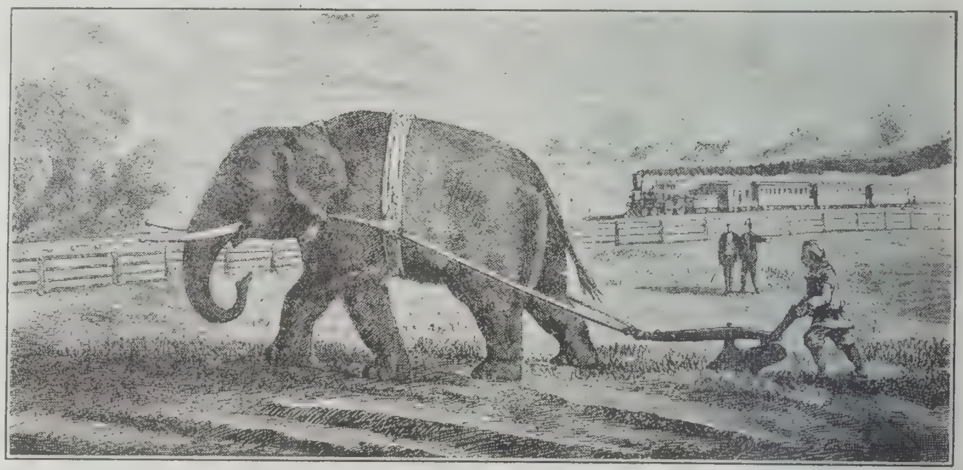
Don't indorse without security.

Advertise your business.

Be charitable.

Preserve your integrity.

From "Struggles and Triumphs."



Barnum advertising the circus—Barnum called this "Elephantine Agriculture." The elephant plowed only when trains were due to pass Barnum's residence at Bridgeport, Connecticut.

With the Submerged Nine-tenths in China

Concluded from page 3

also, was it "fate" that upset the rice bucket of the itinerant restaurant man upon an unwontedly filthy pavement, or loosed the flock of small devils that brought a motor car into violent conjunction with the strolling duck merchant's basket of eggs.

Certainly there was about this general cheerfulness over adversity no hint of the West's exaltation of poverty and humility, although it is true that we made the discovery of a hoary proverb of China echoing the sugary western sophism. "Better an earth-lined cave from which the stars are visible, than a golden pagoda roofed over with iniquity." This was the Orient's saw.

But if there was fatalism in the Chinese acceptance of whatever fortune came his way, there was no sitting slothfully waiting, like Micawber, for something to turn up. Even the beggars were industrious. We came to recognize one of this cult, a frightful spectacle, with bared legs seemingly shrivelled and gangrened with some unspeakable affliction. He was an artist at this sort of thing. The neighbors knew him, and grinned over him, when there was no good "customer" in sight. His sores were specious, and cost him much laborious preparation!

It was a surprise to find, upon the occasion of a "night out," that all China seemed awake to the day's work, though dawn was still distant and we were not yet abed. Countrymen were posted upon market corners, waiting for daylight, after a tramp of many miles from the source of their produce. Rickshaw men were abroad, coolie commerce was astir in the streets. Boat traffic moved like the tide.

Hours were long, and there was no punching of clocks. There was, in effect, little sense of the value of time. And this seemed to us a damaging modification of the Celestial's virtuous industry. He worked unremittingly with a paucity of results. His energy, properly directed, should have been vastly more productive. And further, though he was up before dawn and at work until late at night, he was of unhurrying, unchanging pace. This had been established by "olo" custom, and it was difficult to alter.

But there was modern industrialism to consider. It was evident that, in recent years, some inroad had been made upon this deliberate pace of the Chinese workman. An American factory manager in Shanghai was authority for the statement that within three or four years he had brought the efficiency of his Chinese employes, through the medium of modern factory methods and machinery, close to that of the American workman. He expected, in time, to surpass the American mark. This was his recipe:

"You've noticed the shape of the Chinese hand, the long tapering fingers? Then you'll agree that the hand couldn't have been better designed for speed in the handling of fine, delicate work. With such material as that, it's easy to get results in any line of factory production. To start with, operations should be put on a piece-work basis. Output will be slow, of course, if you don't stimulate it.

"A very successful way is to take the highest production per operator obtained in a single department—say 2,000 net per ten-hour day—and offer approximately a week's pay as bonus for the first operator reaching 2,200 net in ten hours. As soon as this figure is met, boost it another 200, and so on. I've known this method to increase efficiency fifty per cent in three months."

Another method was appealing to pride—or, as it was termed locally, "face." This, he said, was something new, for hitherto the zeal of the Chinese workman had not been due to anything like competitive ambition, but rather to the dull necessity of keeping the wolf from the door.

Mr. Ford's Page

BUSINESS needs no defense, because business is service. It is the organization of effort, of supply, of opportunity. Society tampers with it at its peril. As well obstruct the water-supply of a community as the commodity-supply. Yet, even at this day, one hears echoes of complaint and enmity against that which is one of the best and most humane things we do.

Assuming that previous articles on this page have made clear the fundamental difference between Industry and Finance, and clear also the fact that the manufacturer is not necessarily the capitalist, unless he has learned wisdom and kept his capital for the use of his business and his workmen, there remains to be made clear the sources of all the misunderstanding in which this matter is involved.

The antagonism may be grouped around the idea that the chief curse of life is to work for a living. Normal men know that work is the salvation of the race, morally, physically, socially. Men deprived of their work fall prey to all sorts of unnatural diversions, the reason therefor being this: the absence of wholesome occupation is usually the open door to all sorts of unwholesome preoccupations. Work does more than get us our living; it gets us our Life. It is the sea-tide that prevents the world from going stale. One naturally wonders about the old story that states the origin of Work to have been in a curse expressed by the Almighty. It seems impossible to relate with the facts of our common daily experience. Perhaps if we had the whole significance of that story we should learn that not Work itself, but the unnecessary ingredient of strain, anxiety, worry in work, is the disagreeable element which is condemned. Certainly not Work itself. Every normal fiber of personality proclaims useful and satisfying occupation a prime blessing.

There come to the earth from time to time managerial minds who not only enlarge the scope of work but systematize it and place it on a basis of security. In other and earlier times they came to use their faculties of organization for purposes other than the personal prosperity of the people whom they used. As political groups these latter sometimes obstructed their own liberties. As military groups they reddened and saddened the earth with inexpressible inhumanity. But always, and even in such futile ways, the people were obeying an instinct to follow strong leadership. It is one of the divine qualities of the people that they *will* follow a leader. This is the way they have learned to distinguish between good and bad leaders. They have learned that strength is not always goodness, and that the strong leader sometimes led them to a bad outcome. They learned also that they are right to admire strength, but that strength comes to its perfection only in the purpose to give general spread to some much needed benefit.

There is no use quarreling with the unfolding of history, any more than with the unfolding of the leaf. It is beyond our control. Our contemplation of the method leads us to respect it. If, at one time, leadership was military, let us agree that at that time military leadership was the most needed and the most useful. If at another time political leadership seemed to fill the unspoken need of the great masses of men, let us recognize the unnamed wisdom which brought that to pass in its own time. But now, now, in our own times, the quality of leadership is plainly changing. The man who would serve the race, on the leaping crest of the wave of service, is he who can help them adjust their efforts to their needs in a manner that shall make women content and children happy. We, as men, can afford to stand a good deal of rough handling ourselves, if we can only see our women-folk unworn by care and our children as God meant children to be.

"To make a fireside's happy clime
For weans and wife,
Is the true pathos and sublime
Of human life."

The Plowman poet struck fire from the human heart when he said that.

It is plainly the duty of young men coming to the fore, the young men in colleges, in pulpits, in industries, the young men who see more in journalism than the routine excitement of the day, to challenge the whole trend of loose thinking that describes business as an imposition on men.

In our day the size to which industries grow disturbs some people. They are afraid of bigness. Well, as a matter of fact, every business, from the cobbler shop on the corner to the great manufactory, is either growing bigger or becoming smaller. "Holding your own" is merely the moment that intervenes between going up and coming down, like a bird poised motionless in the air. If your business is not getting larger, it is getting smaller. Perhaps you may not be in business; maybe you are just filling a job somewhere. The same principle works. You have made your job bigger, or you have not. It is really a remarkable experience to observe how, in the midst of a closely organized industry, ordinary men with honest purpose expand the corner where they are —elbow it out and make it bigger, until it becomes known that in that part of the shop there is a different degree of service. If one were not open to the suspicion of preaching an outworn "pep doctrine" (which never was any good anyway, and which no sensible employer ever encouraged) one would say with forthright force that there never was a great company or manufactory so well organized that individual quality could not make itself felt. But maybe not immediately. Not the first week or the first six months. A man with a reputation for stability for five years is already a winner. The "pep philosophy" did this damage: it encouraged a brief period of spectacular endeavor, and then it blew up and cooled off. That is not quality.

When we first discussed the ideas on this page, there were three ideas in mind. One was the matter just discussed. One other was the matter of the employer being the capitalist. The third was the new and modern idea of using business for service. But in between these occur certain questions, both of which should be defined now. There are people who think of big Business as dangerous because it is big. They believe that the old and inefficient way of each business being self-sufficient in its own town is the right idea. And one hundred years ago it *was* the right idea. Each cobbler in his little town made the shoes—and they were good shoes. The local wagon maker made his wagons for the townsfolk.

The point to be remembered about the establishment of industry is that while all these various new ideas were being developed the people who paid for them were the people who purchased the vehicles. No tractor, no thresher, no motor car, no locomotive, in fact no new industrial device has ever been developed except the people have paid the expenses.

There are people who think that perhaps it might have been better if we had more small businesses than a few great ones. Of course, such a statement is just pure mental conclusion. It surely is not based on the facts. Ride along any railroad, observe the industries of any small town, read the industrial signs that indicate individual ownership, and you will see with your own eyes that the engineering ability and the mechanical ambition, which made our present great serviceable concerns, is still being born in the young lads of our land.

> *THAT the necessity of working for a living is a curse and not a blessing is a fallacy that it is hard to kill. But work is not only the life of the body, but the builder up of the mind. Service is the big business of life; its fruit is more refreshing than any other. There must be strong leaders in business as well as in the command of armies, and an even wider range of skill is called for in directing industry than in conducting military campaigns. There is no marking time in the march of industry as there is in an army; no halting by the wayside. Industry must either advance or retreat; it can never remain still. The gaps in its ranks must at once be filled or mankind would perish. To fill these gaps ambition falls like a dew on the sprouting enterprise and so vivifies it that a robust plant takes the place of that which has wilted for want of nourishment.*

Politics

THE speeches of acceptance have been made, the Vice-Presidential candidates have expressed themselves as oracularly as have the heads of the tickets, and the campaign has reached the period of challenge on the Ku Klux Klan! There, for the present, it sticks. Mr. Davis says that the Klan is not properly an issue in the campaign and asks President Coolidge so to declare it; but as Mr. Coolidge has never dragged the Klan into the campaign, it is doubtful if he shall feel obliged to drive it out. Mr. Dawes meets a Democratic challenge by denouncing the Klan in one breath and in the next breath giving plausible reason for its existence in some communities "where the regularly constituted officers of the law are cowards"; and then he outdoes the whole of Klandom in denouncing the LaFollette support, which as everybody by this time knows is socially, politically and financially Jewish. Mr. Dawes made himself perfectly eligible for Klan membership by his statement about the LaFollette organization. And there, with Brother Bryan showing that lucid thought and simple style do not go by kinship, the campaign sticks.

The impression is very strong that these men do not care to alienate the Klan vote, but want to keep the anti-Klan vote. Pure political hypocrisy.

First in order is Senator LaFollette's speech of—not acceptance but of terms. He laid down the law, as he always did, and the Hebrew Trades Unions, together with all the "red" elements that have killed every progressive movement since Roosevelt's time, took him up. That will prove both the pitifulness and the doom of the LaFollette movement. The American people will not elect as President the choice of New York's East Side. It is far too sad an end for Senator LaFollette's long career of honest and courageous usefulness and it is difficult to think of the type of political judgment that permitted him to ally himself with such doubtful forces. It no longer matters what the Senator promises, charges or proves: the support behind him is anti-American and cannot win, even through so respectable a "Gentile front" as he, the highest seat in the nation.

Mr. Davis made a graceful speech which did all that could be done under the circumstances. He is a gentleman and he knew that in the best regulated families regretful, unforeseen and uncontrollable things occur—to which rule the Republican party is no exception. If the Republican party had pursued the investigation of war frauds committed under the Democratic administration (though probably in no way directly attributable to it) instead of concentrating their energy in cleaning out their own Republican rascals, one wonders what would have been left for Mr. Davis to say. Take away these adventitious elements, and little is left for Mr. Davis to discuss in the way of future policy for the nation.

President Coolidge came through, as he always does, on the note of American common sense. He evaded no issue, not even the recent scandals (indeed, he never has evaded them) but took high ground in saying that one man's defection, or two men's defection, does not prove that the government of the United States is rotten. Every man, Democrat or Republican, who has ever had any experience in the government of the United States will endorse that attitude as justified by his own observation. No major issue is left undefined, and the President's attitude toward each is clearly stated. Other candidates and parties are left alone save for this paragraph which may be construed as the President's reference to other pleas that other candidates will make to the electorate:

> *"We are likely to hear a great deal of discussion about liberal thought and progressive action. It is well for the country to have liberality in thought and progress in action, but its greatest asset is common sense. In the commonplace things of life lies the strength of the nation. It is not in brilliant conceptions and strokes of genius that we shall find the chief reliance of our country, but in the home, in the school and in religion."*

That is normalcy with a definiteness and soundness never before achieved since normalcy became a common term. It is also Coolidge to the core. And it will carry farther, develop more power, influence more thinking than all the invectives of Mr. Davis and Governor Bryan or all the liberalism of Senator LaFollette.

But, as far as politics is concerned, the consensus of opinion seems to be that there isn't much in the national sense. There is a nimble scramble for local offices in various parts of the country. As far as the Presidency is concerned, however, that seems to have been pretty definitely settled since last December. It was regarded as a certainty then that Mr. Coolidge was approved by the nation, and his strength has increased in the meantime.

However, we shall see what we shall see. It is yet possible that the political magicians may be able to concoct some subtle fire which will produce the semblance of a heated contest.

What Have They to Fear?

THE publicity directed against the defense test to be held September 12 has not been quite fair. Mr. Davis and Governor Bryan probably realized this, for they have evidently learned that silence befits Democrats at this time much better than opposition could. *For the present Defense Act of the country is a Democratic measure.*

When Mr. Wilson returned from Europe after his treaty-making, he was alarmed by what he had seen, and proposed a standing army of 500,000 men for the United States. More than that, universal military training was proposed. This plan would have cost the country one billion dollars a year. The Democrats defeated it, and they were probably right in doing so. But what they did propose, and what they did pass, was the very method which is now about to be tried out. For three years the officials charged with the defense of the United States in time of danger have worked over these halfway plans, fitting them together, then getting them into workable shape, and finally asking that they be given a paper tryout.

It is a defense system which the Democrats and all pacifists approved that is being tried out.

Yet Governor Bryan, Democrat, and Mr. Davis, Democrat, opposed it—before they thought.

And, of course, the whole LaFollette force opposes it, for perfectly evident reasons.

It is their own bill.

Why do they fear to try it out?

A Neglected Scheme

THE English are not ready to transform their island into a Continental peninsula by means of the oft-discussed tunnel under the channel.

The latest suggestion that the project be seriously considered by the government has just been decisively rejected.

Premier Ramsay MacDonald expounding the subject in the House of Commons declared the Committee on Imperial Defense had found that all naval, military and air development during the last five years have without exception tended to make the channel tunnel not a less but a more dangerous experiment.

Engineers say the tunnel would stand or fall as a commercial undertaking solely by the passenger traffic it succeeded in attracting.

The rapid development of airplane passenger services between London and Paris would seem to diminish the traffic possibilities of the channel tunnel if it were built.

It is unlikely that people would care to be cooped up in a train underneath the English Channel for an hour or more when in little more than that time the entire journey from one metropolis to the other could be made by air.

Worlds Unknown

THE fact that the planet Mars has been nearer the earth than it has been for hundreds of years has afforded scientists a unique opportunity for making further explorations in that remote region of the unknown. Although nothing has been added to the theory that life in its higher forms may exist on the planet, data has been secured which will materially aid in arriving at a truer estimate of the physical features of this far-off world.

That there are other worlds and other scenes as yet undreamed of in our philosophy there is no reason to doubt, but that mankind exists on any other astral sphere, is purely hypothetical. What effect such a discovery would have on the established order of the universe, it is impossible to conjecture, but it is one before which all the discoveries that have been made by sages and seers since the world began would fade into insignificance.

There is a theory that Mars is in a much more advanced state of evolution than the earth, but this is based on the assumption that it is a much older planet. All this is purely speculative, and as Sir Oliver Lodge says, Mars may still be in the stage occupied by the earth millions of years before the appearance of man. The fact of the matter is that scientists do not know. They can only base fresh theories on the steadily increasing revealing power of giant telescopes, and the other instruments which modern advancement is making available.

The chances are that it will be many more years before anything of importance will be added to our knowledge of whether life in any form does or does not exist in these worlds unknown. Till then the old earth must remain the super planet.

America Pre-eminent

AMERICANS need not make long, expensive foreign journeys with attendant contact with unfamiliar languages and peoples who have come to believe American visitors were created for exploitation, to enjoy the world's most inspiring scenery.

James Bryce, one of the most discriminating world travelers in his posthumous work, "Memories of Travel," makes this impressive declaration:

"Neither Europe nor Asia nor South America has a prospect in which sea and woods and snow mountains are so united in a landscape as in the view from Puget Sound of the great peaks that rise like white towers above the dark green forests of the Cascade Range, nor any valley gorges wilder than those of the Rockies, more beautiful than those of the Sierra Nevada.

"In richness of colors whether we think of the autumn woods of Maine or the rocks of the Western Canyons, America is pre-eminent."

America is the only country where people of moderate means can visit by motor car so many places of wondrous beauty and lingering charm that have arrested the attention of world travelers.

Gun Prohibition

IT IS being suggested that the time is ripe for some form of prohibition in the use of firearms except for the use of the army and navy and police forces. Certainly the gun has become far too handy a weapon in the outfit of habitual criminals, and there is not the slightest doubt that crime would decrease if the teeth of the gunmen were effectively drawn.

The possession of a pistol renders arrant cowards for the moment bold. There are grounds for believing that were it not for the advantage gained by the possession of a gun the average ruffian would be afraid to show himself in the light of day, or to make his presence known within a mile of an honest man. This sinister advantage ought to be eliminated. Human wolves ought to be rendered powerless.

There are laws against the carrying of firearms by civilians, but these laws are so easy to evade that they are a standing jest. Gunmen laugh at them, and children defy them. The officers of the law are among the principal victims of this contempt. Were it not for the army of gunmen that prey and slay in this country, the police force could be cut in half.

The only way to put an end to such a thing is to check it at its source. Tab should be kept of every revolver or automatic that is turned out of the factory. There ought to be an identification number on every weapon by which it could be traced under any circumstances. All officials and responsible persons should be called upon to render a strict account as to whom such firearms are handed out or sold. Traffic in second-hand weapons should be made illegal, for to this traffic much of the evasion of the law can be traced. Bootlegging in death-dealing instruments must be blotted out if this country is to be made safe for its citizens. "Safety first" has a wide field here.

A Plea for "a Reasonable Intolerance"

By MORGAN D. E. HITE

IN THE present ebb and flow of opinion in America concerning immigration, assimilation of aliens, and the influence of aliens on American life, through all of which the question of "tolerance" rises as the paramount basis of the discussion, the precise meaning of "tolerance" and its effects becomes a timely subject for rigid examination.

In America practically all the people some generations ago were of one species. It was easy to speak of tolerance; it seemed the natural thing, but it never was a real question at all. It remained a more or less abstract proposition; it was an ideal, and as we are now in a position to judge, an impossible ideal. Nature's laws are against it except when kind meets kind. The problem of "intolerance" never arises except when unlikes come face to face. And it is surprising to note that some things which *appear* to be unlike, thrive together in the most generous harmony. Two such *apparently* differing races of people as the "old stock American" and the educated Chinese, for example, have a mutual respect for each other. The policy of the American nation toward China, of the utmost friendliness and helpfulness, is a case in point, formulated in the earlier days of the nation when the "old stock" dominated.

Uncle Sam's Indigestion

AND then we see the mutual intolerance and failure to live in fullest trust with each other, of what *appears* to be two peoples much more alike than those just cited, namely, the various European and American native stock and the Jewish people—that is to say, the undiluted Jewish, which yet fail to arouse that degree of mutual reciprocation which the *apparent* likeness to, say, the American national stock, would seem to justify. The truth is that the likeness is purely apparent, and apparent only to the sense of sight, and ofttimes not even then to those Americans who have the clearest vision.

This dissimilarity is important, when it is viewed in reference to the socio-biology involved in studies of this problem. It may account for many puzzling details that daily serve to complicate national relationships and that retard the assimilation of aliens, indeed, even make assimilation utterly impossible. Recognition of the scientific foundation of the problem in time may assist in digesting much of the hitherto indigestible matter which Uncle Sam has swallowed. *His pains are not growing pains at all, but indigestion.* The old-time and now discredited remedies of opium by-products—such as paregoric and laudanum—which have been regularly given to him as a curative, such as were common before more specific and less sporific remedies came into use—such as modern scientific diagnosticians now prescribe, are passing out of fashion. Uncle Sam is now taking small doses of facts instead and "may be better or well by and by."

In the forenoon of the last century, in the United States, tolerance was entirely lacking, totally absent. All people were of a kind, so to speak, and prior to the Civil War the conflicts of opposite parties and ideas were confined to the same strain of blood at least. The first great break in national unity was at base due to a question of race, as *all great breaks in the life of mankind have been racial in their ultimate causes.* The most serious of all conflicts are racial, and the changing destinies of this country are due to its changing shade of population as much as to any other single cause. Racial conflict always contains the seeds of destruction, due to one set of innate racial aims opposed to another set of innate racial ambitions and projects. These things are irreconciliable except perhaps at the root.

Man the Least Tolerant

IN A FOREST—were these people trees—the most tolerant would speedily and automatically be relegated to the domains or substratum of least light and sun, while towering over them and basking in the best light, sun and air, would rise the intolerant growths. There is a time when *a reasonable intolerance* means the better life and the better persistence of the race.

Among all the animal species, man is the least tolerant, hesitating not to destroy any or all other species with or without provocation. There is eternal war between opposite kinds among the animals, likewise between opposite kinds in the plant world, just as there is struggle going on for mastery between one kingdom as against the other, animals, plants, insects; as between the elements, which forever are at war, when they are of unlike or antipathetic nature but which coalesce and become unified when they have natures in affinity with one another. Among the races of man the most intolerant, when placed in juxtaposition to other races, wins out, conquers. The most thriving animals and plants are those that sweep mercilessly over contiguous animal or plant life, and this result is not always merely physical force or brutal conquest, but ofttimes is most insidious and creeping in its progress, but nonetheless merciless.

Tolerance as an ideal can exist only where a given racial unit retains its racial integralness or racial solidarity in a given geographical area: when opposed by the migration of other races, or by the descent upon it, insidiously or in one fell swoop, of aliens distinct from it, a race can survive only by the one means or the other, by subserviency, contentment to live in the shade of the alien breed, the doing of which attains for it the "virtue" of being a "tolerant" race; or by rising superior to the alien influence and by cleaving through its new environing pressure upward to a superior position, and thereby showing a preference for being classed as an "intolerant" race, and so "branded" by the lesser and slave race.

America is largely confronted with the beginnings of such a struggle at the present time. Tolerance heretofore has been deemed a virtue. But it has in reality been purely negative and an abstraction to Americans. In the case of the basic American race which laid the foundations of the republic, tolerance in the scientific sense elaborated on, can become a positive evil, and the time is here for Americans to assert *a reasonable intolerance.*

A thorough socio-biological survey and examination of the problem is in order, and immigration should be controlled by such facts as may tend to show the irreconcilability of certain aliens and the manifest impossibility of assimilation of such peoples into the American national life. Socio-biological evidence in favor of the admittance of any given race should act as the highest encouragement for persistence along that course. The contrary evidence should serve as the most rigid and intolerant barrier.

Of any given two races side by side, too, the rate of growth has an important bearing; that is to say, the increase in population of each is vital evidence of its future potential. For, as with trees in the forest, of two different species side by side, that one will survive which grows the faster. It will rise to the light quicker and thenceforward shade the laggard tree, which in turn must tolerate the shade of the other or perish. Racial numbers have a tremendous significance in the economy of society and react on all its activities. Whole kingdoms of vegetation can in a short time be erased from the earth by the swifter propagation of alien species, so it may be supposed that any given national stock will similarly suffer.

Intellect and Finance

DISPARITY of numbers, the quantitative factor, has several meanings, such as disparity of money possessions, money power; disparity of ideas, intellectual power; disparity of actual population numbers. It has been proved time and again in history that superiority of the first two can dominate superiority of numbers. America's vast numbers—even though they were a unit racially—might fall a prey to an alien group of relatively small numbers but who might be possessed of great financial and intellectual powers. But when it is evident that the vast population of America is not a racial unit, not perhaps more than one-third at best, the disparity tends to assume the nature of being a still graver menace. Superiority of the "old-stock Americans" in monetary and intellectual possessions, at the present time, however, serves to hold the balance in static control; that is to say, until the great absorptive power of the old stock can complete the process of assimilation. The saturation point is inevitable at some time or other, and then what? The disparity in birth rate between the old stock and the preponderant immigrant stock—preponderant partly because of its higher birth rate—promises to become a pivotal source of evil consequences in the *future*, and bodes ill for the old stock—the only *true*—Americans. But the *immediate* sources of concern rest in the swiftly growing financial and intellectual control exercised by alien stocks, resulting already in the "shading" and subserviency of a considerable fraction of basic Americans. The financial domination in such instances is very real, actual. But the intellectual domination or superiority is false—a fallacy—and is merely sustained by the power of money which in turn gives the power to make and color the reading matter and the educational elements of the nation through the control of means of publicity such as motion pictures, newspapers, news agencies, magazine and book distribution. The superior "tolerance" of the Americans, like the superior "tolerance" of the forest trees, leads to a form of survival for them, it is true, survival in an inferior and less healthful mode of life, where the future is dismal and creativeness is reduced to puerility, in subjection, because it is the life of a slave, certainly *subject* if not *abject.*

It is time, therefore, for a degree of reasonable intolerance to be considered by our "old stock"—and it must be remembered that the *best* of the alien stock of a century-long period is ofttimes incorporated in, and fully becomes an assimilated part of the "old stock" and that only the non-assimilable remains outside the pale as it forever will—and this reasonable intolerance, scientifically founded, should be formulated and made part of our national policy. The return of a form of Puritanism might work well for the nation.

In Nature's Haunts

AT NO season of the year is Nature so lavish in her treasures as at this time. The trees are clothed in their full regalia, the flowers rival one another in their beauty of form and color and in the variety of their perfume, and the birds are in full song as if rejoicing that the most bounteous time of the year is at hand.

One does not need to wander far in search of the things that delight the eye and elevate the mind. On the outskirts of the little town, beneath the shelter of a spreading elm, there is a tiny cottage with a few scattered outhouses attached. It is a farm in miniature, and all the living things around it seem to be in proportion. There appears to be nothing among the livestock so large as a cow. If there is, it is not in evidence; but a drowsy and contented grunting from a rough enclosure nearby indicates that the winter supply of bacon is on its way.

In a little pen a family of young ducklings are resting in the shade or reveling in a discarded kitchen utensil filled with water. By some means a gosling has attached itself to this family, and appears to have usurped the functions of the mother duck. It is apparently a deserter from a gosling family sheltering under some berry bushes not far off, jealously guarded by the mother goose.

There are red roses clinging to the trellised porch, there are Dutchman's pipe and purple clematis enveloping the gables, and over the rough boarded outhouses the Virginia creeper casts its rich mantle. In the little garden plot the esthetic and the utilitarian are judiciously blended. Cabbages are cheek for jowl with columbines, roses with radishes, cornflowers with carrots, and larkspurs with lettuces. It reminds one of the garden in the story of "John Halifax, Gentleman."

A colony of bees is snugly located under a lilac bush, the neighboring clover fields forming an unlimited source of nectar, apart from the homely flowers of the garden.

The Link of Town and Country

ALL this, however, is but the connecting link between the town and the country; the peaceful borderland between the haunts of men and those of the wild creatures of fur and feather that frequent the more distant woodlands. With the modern means of transportation at one's command, it is only a matter of minutes until one has left the urban atmosphere far behind, and the haunts of Nature in her most seductive moods are reached.

The heat of the day is past for the sun is declining; the clouds, resplendent in a multitude of glorious tints, float against a background of purest azure. From the overhanging boughs of the trees the feathered songsters rival each other in the volume and spontaneity of their melody, while in the long grass of the neighboring meadow the "Bob White" sounds its persistent and plaintive notes.

Squirrels gambol among the tree boles as if anticipating the delights of the nut harvest, chipmunks run along the tops of the fences or sit quite still gazing at one with their keen bead-like eyes, and the field mice are already sampling the ears of ripening grain. The robin has not yet ceased its song, the meadow lark still gives forth its mellow symphony, and the thrush peals forth its bravura from a swinging spray.

There is a brooklet, almost unseen, which winds its way among the raspberry bushes, and adds its tinkling murmuring melody to the harmony of the woods and fields. The whole forms Nature's perfect woodland symphony, music which the greatest geniuses in the world of music have tried to imitate from the dawn of time, and in so far as they have succeeded in incorporating those melodies in their compositions has been assigned the measure of their fame. Not only in the realm of art but in that of music is Nature the greatest teacher. Handel, Wagner and Chopin found their inspiration here. Neither pastoral symphony nor oratorio might have delighted the ears of succeeding generations had it not been for the myriad voices of forest and field.

After all, the whole wide, wide world is but one vast radio-casting station; Nature's children tune their voices, and through the celestial ether it is borne from field to field and from tree to tree, and caught up and carried on again and again, until from the rising of the sun to the going down thereof, earth and sea and sky rejoice and are glad.

The Stone of Destiny

A BILL has passed its first reading in the British House of Commons which has for its object the restoration to Scotland of the Stone of Destiny which was carried off by Edward I during the war of independence.

This stone was taken to England and placed in the seat of the coronation chair of the English kings, and upon it all the sovereigns have been crowned for the past 600 years. Before its removal by Edward I, the Scottish monarchs had been crowned on the stone for a period of half a millennium.

This relic has from the earliest times been regarded with reverential awe, for, according to the tradition which was at one time firmly believed by the Scottish people, it was the stone on which the patriarch Jacob laid his head when he had the vision of the angels ascending and descending the celestial ladder at Bethel.

When Scotland lay bleeding at the feet of "Proud Edward," that monarch seized the opportunity of depriving the nation of what it regarded as its most precious treasure, thinking thereby that he would not only cause it the greatest possible humiliation, but deprive it of the divine help and prosperity which was supposed to remain in the kingdom as long as the Stone of Destiny was there.

Shall the Youth of America Be Exploited?

A Brand of Communism Which Aims at Control of Junior Farm Clubs

By ROBERT MORGAN

There are approximately 11,000,000 boys and girls on the nearly seven million farms of the United States. These are the men and women of America of tomorrow. About 700,000 of them are members of boys' and girls' farm clubs, organized control of which is now being sought as the first step in the exploitation of every boy and girl on every farm in the United States.

The international organization wants to teach them communism, under the guise of the Sapiro Plan of co-operation, that it may control, within the next ten years, every American farm, and handle every American crop, and that Jewish mail-order houses may become the retailers of the nation, thereby eliminating the American merchant and withdrawing all available money from the small town.

This story tells how this has been planned and what has been accomplished.

NOT SATISFIED with the ruination of the American stage, the degradation of the motion picture industry, and the spoliation of the thousands of American farmers who have been unwise enough to follow its leadership, the Jewish power in the United States is now seeking to control, "educate," and exploit, to its own present and future profit, every boy and girl on the nearly seven million farms of this country.

Working quietly, through every agency they find available to their hands, the Jews engaged in this undertaking, with their Gentile agents, employes and "friends," are moving along three major lines to obtain domination over the boys and girls of America. First, they are establishing private boys' and girls' farm clubs, cattle clubs, poultry clubs, dairy clubs, organizations of all kinds in which farm boys and girls can be interested. These clubs are in direct opposition to the already established boys' and girls' farm clubs supported by the United States Government and of whose national committee President Coolidge is national chairman.

Second, organized Jewry is establishing private foundations, from which go out gifts, awards, and prizes, to the boys and girls in a direct and well-financed effort to lure from the boys' and girls' farm clubs, already established by Americans on American principles for American children, over to the Jewish clubs.

Third, by constant and consistent broadcasting by radio, and by insistent floods of letters, the incessant presentation to every farm boy and girl in America of arguments favoring the private (Jewish) boys' and girls' clubs and foundations, as against the American organizations of similar nature. Just as the methods being used in this campaign are three, so its objectives are three:

At left—ELAINE HENDRICKS, of Colorado, member of the team which won second place in the national canning contest, and a trip to Europe, in 1923. Besides being a beautiful girl, Elaine is a leader in girls' club work in her state. All this leadership would be taken away from the boys and girls in these clubs, if exploitation of such organizations is allowed. Above—These coming men and women of America form a vast army which the Jews of this and other countries would like to train and control. The photograph shows a local boys' and girls' club in a middle-western community.

First, gradual attainment of control over every farmer and every farm in the United States. Approximately 400,000 American farms become vacant, and pass to new ownership, or into the hands of new managers each year. More than ninety per cent, or 360,000 of these new farm owners or operators or managers, are the sons and daughters of farmers. Trained to communistic ideas, these boys and girls, grown to manhood and womanhood, would be as modeler's clay in the hands of the internationalists.

Second, "education" of this great cross-section of America's youth to belief in and adherence to the Sapiro Plan of co-operative marketing, and the resultant placing—in a few years—of the control of all American farm products in Jewish hands. For the Sapiro Plan, uneconomic, and faulty as it is, is merely a cog in the great machine carefully designed to reduce the American farmer to a working automaton for the exploiting group.

G. L. NOBLE,

Executive secretary of the National Committee on Boys' and Girls' Club Work. He is one of the men who stand between the boys and girls of the United States and those who would exploit them.

Third, the collection from every farm boy and girl in the United States of one dollar a year "dues," netting, when all the boys and girls are so enrolled, *eleven million dollars*, to be collected, handled and paid out under Jewish direction. This plan is part of an official announcement, direct from the headquarters of this movement. Coupled with this collection is the further commercial and financial scheme of giving nation-wide advertising to Jewish mail-order houses, with the objective of ultimately eliminating the American small-town merchant, who not infrequently is the financial and commercial backbone of the community.

This movement for the exploitation of the youth of America was started by the Jews with an effort to get control of the National Committee on Boys' and Girls' Club Work, of which, as I have said, President Coolidge is honorary chairman. E. T. Meredith, former Secretary of Agriculture, is chairman; Thomas E. Wilson, president of Wilson and Company, Chicago, vice-chairman; Melvin A. Traylor, president of the First Trust and Savings Bank, Chicago, treasurer, and G. L. Noble, executive secretary. Though he will not admit it, the fact that the Jews are not now in complete control of this organization and of the 700,000 boys and girls who are members of its branches, is due almost entirely to the work of Mr. Noble. The national committee was organized by the present executive-secretary in 1921. Mr. Samuel R. Guard, true friend of the Sapiro Plan and other Jewish movements for the "benefit" of the American agriculturist, was then publicity director for the American Farm Bureau Federation. The National Committee on Boys' and Girls' Club Work is closely affiliated with this federation; in fact, J. W. Coverdale, executive secretary of the federation, is a member of the board of directors of the committee. It will be further recalled that it was Mr. Coverdale who saved the American Farm Bureau Federation from domination by Mr. Aaron Sapiro.

Mr. Guard, immediately on learning of the centralization of boys' and girls' club work in the national committee above mentioned, proposed to Mr. Noble that a Junior Farm Bureau be organized, and that each of the boy and girl members of the Junior Farm Bureaus be called upon for one dollar a year as dues. This scheme was, of course, to put the boys and girls in junior farm bureaus directly under control of the American Farm Bureau Federation, of which Mr. Aaron Sapiro was to become master. This could not be done under the present arrangement of boys' and girls' club work and the Jewish gentlemen and their agents saw that the youth of America had to be so centralized that they could be controlled and directed by whatever Jew happened to be in control of the farm bureau. Due to Mr. Coverdale's work, no Jew came into control of the farm bureau; due to Mr. Noble's efforts, no Jew came into power among the boys and girls, though they are still fighting for control.

Mr. Noble's reply to Mr. Guard was a brief and final "No!" Thereafter the National Committee on Boys' and Girls' Club Work received no publicity from the publicity department of the American Farm Bureau Federation, of which department Mr. Guard was director. Now, lest Mr. Guard should deny the above statement regarding his activities, I quote from his address to the meeting of the Farm Bureau Federation, at the Hotel Sherman, Chicago, in December, 1923. In giving advice to the federation—by which he already had been dropped—Mr. Guard said:

"I will put in another division, and call it the Social Service division, and in there I would include the first thing, the Junior Farm Bureau; and there is a matter which to me is a terrible thing, that we take our boys and girls and neglect to train them up in the way they should go into our very organization. It seems to me that our boys' and girls' club work has been turned over to other interests, and I, for one, am not very happy about it. . . . . Every year come these boys and girls in here, financed by the packers and the publishers and the other interests, and they go back home and say, 'Daddy, those fellows are not so bad, after all.' I don't think that is right.

"I would have organized a Junior Farm Bureau, and I would charge those little fellows a dollar a year to belong, and I would keep fifty cents in the treasury down there and send twenty-five up to the state and twenty-five up to the national.

"Then, when they went out in the wintertime down along the creek and caught the skunks and muskrats, instead of sending those hides to St. Louis, and getting nothing for them, *I would have a little co-operative fur pool organized for them, and I would train them up into the idea of that.*"

There we have the whole scheme expressed in the very words of Mr. Guard, advance agent of Mr. Sapiro and protagonist of the Sapiro Plan—catch them young, take their money, organize them into controlled associations, and educate them to the Sapiro Plan. This is

(*Concluded on page 14*)

(C) U. & U.

JULIUS ROSENWALD,

President of Sears, Roebuck and Company, a mail-order house in Chicago, with whom Samuel R. Guard is interested in establishing the Sears-Roebuck Agricultural Foundation, with Mr. Guard as director.

A Challenge to the Youth of America

Analysis of Interest and National Debts; Interest Contradicts All of Nature's Laws; Nations Pawn Cradles of Their Unborn

By JOHN BASIL BARNHILL

WITH the opening of our schools and colleges it is not inappropriate to take up the famous challenge to Professor Fawcett in which John Ruskin attacked the professor's defense of interest. For this was not only a challenge to all professors pledged to the defense of interest, it was also a challenge to the thousands of undergraduate students, to take up in all seriousness the subject of interest. If our American undergraduates will gently but firmly call the attention of their teachers to the fact that Ruskin's challenge is still awaiting an answer, progress may be made.

In Letter 18 of *Fors Clavigera* Ruskin writes:

At the 146th page of Professor Fawcett's "Manual of Political Economy" you will find it stated that the interest of money consists of three distinct parts:

1. Reward for abstinence.
2. Compensation for the risk of loss.
3. Wages for the labor of superintendence.

I will reverse this order in examining the statements; for the only real question is as to the first, and we had better at once clear the other two away from it.

3. Wages for the labor of superintendence.

Payment for Doing Nothing

BY GIVING the capitalist wages at all, we put him at once into the class of laborers, which in my November letter I showed you is partly right; but, by Mr. Fawcett's definition, and in the broad results of business, he is not a laborer. So far as he is one, of course, like any other, he is to be paid for his work. There is no question but that the partner who superintends any business should be paid for superintendence; but the question before us is only respecting payment for doing nothing. I have, for instance, at this moment fifteen thousand pounds of Bank Stock, and receive twelve hundred odd pounds a year, from the Bank, but I have never received the slightest intimation from the directors that they wished for my assistance in the superintendence of that establishment; (more shame for them.) But even in cases where the partners are active, it does not follow that the one who has most money in the business is either fittest to superintend it, or likely to do so; it is indeed probable that a man who has made money already will know how to make more; and it is necessary to attach some importance to property as the sign of sense: but your business is to choose and pay your superintendent for his sense, and not for his money. Which is exactly what Mr. Carlyle has been telling you for some time; and both he and all his disciples entirely approve of interest, if you are prepared to define that term as payment for the exercise of common sense spent in the service of the person who pays for it.

2. Compensation for risk.

Does Mr. Fawcett mean by compensation for risk, protection from it, or reward for running it? Every business involves a certain quantity of risk, which is properly covered by every prudent merchant, but he does not expect to make a profit out of his risks, nor calculate on a percentage on his insurance. If he prefers not to insure, does Professor Fawcett mean that his customers ought to compensate him for his anxiety; and that while the definition of the first part of interest is extra payment for prudence, the definition of the second part of interest is extra payment for *im*prudence? Or, does Professor Fawcett mean, what is indeed often the fact, that interest for money represents such reward for risk as people may get across the green cloth at Homburg or Monaco? Because so far as what used to be business is, in modern political economy, gambling, Professor Fawcett will please to observe that what one gamester gains another loses. You cannot get anything out of Nature, or from God, by gambling—only out of your neighbor: and to the quantity of interest of money thus gained, you are mathematically to oppose a precisely equal *dis*-interest of somebody else's money.

These second and third reasons for interest, then, assigned by Professor Fawcett, have evidently nothing whatever to do with the question. What I want to know is why the Bank of England is paying me twelve hundred pounds a year. It certainly does not pay me for superintendence. And so far from receiving my dividend as compensation for risk, I put my money into the bank because I thought it exactly the safest place to put it in. But nobody can be more anxious than I to find it proper that I should have twelve hundred pounds a year. Finding two of Mr. Fawcett's reasons fail me utterly, I cling with tenacity to the third, and hope the best from it.

The third, or first—and now too sorrowfully the last—of the Professor's reasons, is this, that my twelve hundred pounds are given me as "the reward of abstinence." It strikes me, upon this, that if I had not my fifteen thousand pounds of Bank Stock I should be a good deal more abstinent than I am, and that nobody would then talk of rewarding me for it. It might be possible to find even cases of very prolonged and painful abstinence, for which no reward has yet been adjudged by less abstinent England. Abstinence may, indeed, have its reward, nevertheless; but not by increase of what we abstain from, unless there be a law of growth for it, unconnected with our abstinence. "You cannot have your cake and eat it." Of course not; and if you don't eat it, you have your cake; but not a cake and a half! Imagine the complex trial of schoolboy minds, if the law of nature about cakes were, that if you ate none of your cake today, you would have ever so much bigger a cake tomorrow—which is Mr. Fawcett's notion of the law of nature about money; and, alas, many a man's besides—it being no law of nature whatever, but absolutely contrary to all her laws, and not to be enacted by the whole force of united mankind.

Not a cake and a quarter tomorrow, dunce, however abstinent you are—only the cake you have, if the mice don't get at it in the night.

Interest then, is not, it appears, payment for labor; it is not reward for risk; it is not reward for abstinence. What is it? One of two things it is—taxation, or luxury. Of which in my next letter.

Again and again Ruskin enforces the teaching that "National debts, paying interest, are simply the purchase by the rich of the power to tax the poor." The teaching fell on stony soil. As long as the debt-creators observed the "Rule of Reason in Robbery," the situation was safe and sane. But in permitting a world, in pawn, to run up 150 billions of interest-bearing debts, the debt-expanders have undoubtedly overplayed their hand and now, bled white to pay the interest on these debts, we begin to appreciate how well inspired Ruskin was in asserting that interest was a monster, which, if unchecked, would ultimately devour the race. In *Fors Clavigera* Ruskin repeatedly shows that interest is merely a form of taxation. We quote a few of his most striking passages:

Unjust Taxation

I VERY positively can inform you, the considerablest part of the misery of the world comes of the tricks of unjust taxation. All its evil passions—pride, lust, revenge, malice, and sloth—derive their main deadliness from the facilities of getting hold of other people's money open to the persons they influence. Pay every man for his work—pay nobody *but* for his work—and see that the work be sound; and you will find pride, lust, and sloth have little room left for themselves.

Fors Letter 16.

If the employes of all these different enterprises (roads, railways, banks, great joint stock companies, public charities, municipal corporations, and local boards) were appointed and paid by the government and looked to the government for every rise in life, not all the freedom of the press and popular constitution of the legislature would make this or any other country free otherwise than in name.—*John Stuart Mill.*

That government is best which governs least.—*Jefferson.*

It is not by the consolidation or concentration of power but by their distribution that good government is effected.—*Jefferson.*

Solon was the profoundest political genius of antiquity. Before Solon's time the only resource against political despotism that had been known was the concentration of power. Solon undertook to effect the same object by the distribution of power.—*Lord Acton* (Essay on Liberty).

There is not knowledge and wisdom enough in all the governments in the world, had they all its benevolence, to regulate the supply of the fruit and vegetable markets of one city, so well as it is regulated by free wagon roads and the observations of farmers, gardeners, and buyers, the producers increasing supplies to meet the demand and the buyers taking any overplus when it comes down to the price they can afford.—Galveston *News.*

The American Turns Up in German Drama and Movie

By HARBOR ALLEN

THERE is a wild scramble on the part of German movie producers to lay the scenes of their films in American cities and to stage sensational American society and underworld pictures. An American, however, can sit safely through any of these without being in the least aware that the United States of America is, as the German says, "passing in review before him."

Typical of this recent development in the German film is the successful and popular *Die Strasse, The Street*, by Leo Grune, which is taking Germany by storm as *The Birth of a Nation* once stormed America.

From *Die Strasse* one gets the impression that Americans spend most of their time drawing $100 bills out of their pockets and playing blackjack at $50 a draw. Typical German tile stoves, policemen dressed like Belgian bell boys, street scenes that resemble a cross between a cubist city and a Parisian boulevard, and cabarets in which a man risks his neck and his purse every time he checks his hat are sprinkled liberally throughout the German's cinema, "America."

These portrayals reflect pretty accurately the conception the average German has of America.

Die Strasse is also typical of the latest German movie in the important rôle it gives to several children actors. This is the influence of genuine American films on exhibit here. By far the most popular film star in Germany today is Jackie Coogan, the *Liebling* (darling) of Munich and Berlin.

In fact, so popular has the diminutive "Chakie" become, that practically every popular magazine and paper is filled with cartoons and pictures of him, and "Chakie" dolls are being sold in all the novelty shops. German critics declare that the simple, good-natured escapades of the Coogan films are weaning the German audiences away from the involved, emotional sex plays, which are their usual diet. One typical German love-story film, of the type crowding the large city theaters here, would set every anti-vice committee in America on its ear, not without cause.

False Impressions

BUT even the law recognizes the wholesomeness of the "Chakie" pictures, and lifts its ban against the admission of children under eighteen into "Kino" houses whenever one comes along.

The average run of German movie, despite the evidence of several notable exceptions which have reached America, is decidedly inferior to the American movie both in camera work and in production. The lighting is especially spotty and poor, often dazzling and disturbing to the eyes, as American movies were ten or fifteen years ago. While the American producer is working away from the excessive use of subtitles and close-ups, the German producer is just warming up to them.

Unfortunately, the average American movie imported into Germany is the cheapest and poorest America has to offer. "Fix and Fax," two unbelievably stupid and dull comedians of the prehistoric custard-pie school, advertised over here as "America's best," are absolutely unknown in the States. Many an insignificant bungler is held here as a "famous American star." People who know the better American film are hoping the stabilization of the mark and the rise of commodities to world prices will introduce Germany to America's first-raters.

American drama has also made its debut here in the translated works of Eugene O'Neill—"Eugen Mac O'Neill, the Irish-American playwright," as he was advertised on the opening night. The play was *Kaiser Jones,* as we know it—*Emperor Jones.* It will be followed by *Annie Christie* and *Der Haarige Affe* (*The Hairy Ape*).

Kaiser Jones was not a success. The translation was poor, and failed adequately to indicate the Negro dialect or the unusual circumstances of a Negro "emperor." Jones more nearly resembled Al Jolson than the blood-and-flesh character of O'Neill. Few Germans have any conception of the Negro or of the Negro problem in America, or of the American's conception of the Negro.

The critics felt that the "Irish-American Mac O'Neill" had learned to write dialogue from Bernard Shaw and had conceived his situation from Shakespeare. They called the play a Shaw-ization of *Macbeth*—"if you can imagine Macbeth fighting for three acts with the witches."

This is the verdict which should give hope to American critics of American critics! Incidentally, it is illuminating to know that Shakespeare, Shaw and Oscar Wilde are the only dramatists of the English language well known to German playgoers. Why the critics did not compare O'Neill to Oscar Wilde has yet to be explained.

With the translation of "Main Street" into *"Die Hauptstrasse,"* Sinclair Lewis introduces modern American literature into Central Europe. The only other modern American writer at all known here is Upton Sinclair. Boosters of the new American school, however, need not feel discouraged by this neglect, for practically none of the great living English writers, with the exception of Bernard Shaw, is ever mentioned. The war and the subsequent impoverishment of Germany's middle and lower classes have prevented Germans from importing foreign books.

What conception the average German has of the American's intelligence can be gauged by the queries of a group of professors' wives in Munich, who asked an American visitor if there were any legitimate theaters in New York and Chicago, if Americans ever read books, and whether American homes were not always "expensively but tastelessly decorated"!

"There Is No Such Thing as a Bad Boy"

By FRANK MINER

"UNCLE FLOYD" STARR

WHEN Floyd Starr was about four years old (and the accompanying recent photograph shows that that was not much more than a quarter of a century ago), he heard his parents discussing the great good a certain man of wealth was doing by adopting and educating a large number of poor boys and girls.

It gave Floyd an inspiration, and a few days later he announced that when he grew up he was going to establish and conduct a home and school for so-called "bad boys," and was going to help them to become good men.

His parents laughed at him, which caused him not to mention his ambition again, to any one, until he was in college. His second announcement was taken more seriously, for he was then beginning to lay his plans for his life's work.

Providence gave him the custody of three boys who needed a guiding hand. This happened shortly after he had invested his savings in a forty-acre farm bordering on a beautiful little lake, three miles west of Albion, Michigan.

On the evening of September 9, 1913, Mr. Starr and his three wards arrived at the farm, and they spent their first night in the barn, sleeping in the haymow.

A few weeks later, their first house was completed, and on October 3 they dedicated it as Gladsome Cottage.

Their number had increased to seven, and with this start Mr. Starr, on December 3, 1913, incorporated the Starr Commonwealth for Boys, an organization not for pecuniary profit. The farm became the property of the Commonwealth (without any consideration being paid Mr. Starr), and that which Floyd Starr had dreamed of by night and planned by day, almost constantly from the time of making his first declaration, became a reality.

Today the Starr Commonwealth represents an investment of more than $125,000. Its permanent buildings are composed of Gladsome Cottage, which furnishes a home for nine boys; Newton Hall, with a dormitory that accommodates thirty-one boys; Wilcox Cottage, with a dormitory for fifteen boys; the Emily Jewell Clarke school building, with a large auditorium; and a modern kitchen and laundry which is now under construction.

Between fifty and sixty boys, of ages ranging from five to nineteen years, are participating in the privileges of the Commonwealth.

This brief description of the conception and development of this most unusual and truly wonderful place is given that what follows regarding Floyd Starr and his work may be better enjoyed and understood.

Although a comparatively young man, he has succeeded in proving "beyond a shadow of doubt," as the judge would say it, that there is no such thing as a normal child being born a criminal, and that heredity has but little, if anything, to do with the molding of character.

"So you believe that there is no such thing as a bad boy?" I asked Mr. Starr, and I shall never forget the way he answered me. It was not so much what he said as the way he said,

"Ab—so—lute—ly," with an accent on every syllable.

I then asked, "What do you call the misconduct and even the criminal acts of boys?"

"Misdirected energy," was his prompt reply.

"Have you ever failed to prove your theories with any individual boy?"

"Not where I have been permitted to direct the boy without interference from the parents or the court. There have been cases in which boys have been taken out of the school by parents or by the court and returned to the old environment before the new habits had become so thoroughly fixed that the boy could withstand the temptations of the old life."

"Have you exercised any care in selecting your boys?"

"None whatever, except I must know that they are normal mentally, and free from any physical handicap. All boys must pass the Binet and the Wassermann tests."

"I had in mind other conditions, aside from mental and physical. For instance, do you avoid taking a boy with certain criminal tendencies, or one who has actually committed a series of criminal offenses? In other words, do you try to secure boys who have got beyond the control of their parents but have not committed a crime?"

"I do not like to discuss the mistakes my boys have made, and especially for publication. We forget the past as much as possible, and think only of the future; but I will say that, owing to our limitations as to the number of boys we can accommodate, I have tried to do the greatest good possible with the limited number and have endeavored to give a home to the boy that needed it most. The extent of the crime or crimes committed has never been considered. I have realized from the beginning that to succeed in my work I must prove my theories with extreme cases, and so I have always been glad to open our doors to the boy that others have said was beyond recall."

"Then you do not believe in the old theory that one bad apple in the barrel will spoil all the rest?" I asked.

"With apples, yes—but with boys, no. And especially when the good boys have learned from experience how much more fun there is in being good than in being bad."

"Well, tell me, Mr. Starr, if you will, just what is your secret of handling these boys?"

He looked at me for a few moments, and then replied, in a soft but clear tone—"Love, honor and confidence."

"I don't quite understand you," I said.

To which he replied, "You are to be our guest until tomorrow, and I am sure that you will understand before you leave."

Then he explained further by saying, "First, I am doing a work that my heart and soul are in. I love my work and I love my boys, and they in turn love me. Second, I work on the theory that every person gets more pleasure doing right than doing wrong, and I develop the spirit in my boys to want to do right because it is the honorable thing to do. And third, I prove to the boys that I have absolute confidence in them, and their love and honor cause them to want to do right at all times."

He then added, "Of course, I help the boys in many ways to meet their daily problems. I am their adviser and counselor at all times, and I enter into their work and their plans in such a way as to give them character and strength to fortify themselves against temptation.

"While the boys all call me Uncle Floyd, I am sure that the feeling that exists between us is more like that of father and son."

A pleasant interlude in the music room.

A young man entered the room, and I was formally introduced to him. He grasped my hand with a real handshake, as he looked me squarely in the eyes and assured me that he was pleased to have the pleasure of meeting me. It was a meeting of two men on an equal basis. No apologies were needed. I felt that I had clasped the hand of a young man of character who, while small in stature and young in years, was every inch a manly fellow, fully capable of fighting his battles through life and making the most of every opportunity.

As we seated ourselves, I looked him over carefully and thought, "Surely, this is not one of the so-called bad boys that I have come all this distance to see."

General view of the Commonwealth buildings from across the lake.

The Commonwealth estate is located on the bank of a beautiful little lake and skating forms a part of the winter sports and exercise.

After a few minutes of general discussion, Mr. Starr turned to the young man, whom we will call Frank, and said, "I am going to tell Mr. Miner something that happened today, which made me very happy and very proud of you."

Addressing me, he continued, "It was necessary for me to discipline one of the boys by causing him to go to the Wilcox Cottage and to sit quietly on a chair for two hours, which would give him an opportunity to reflect and to figure out just why he should not have done a certain thing. Very much to my surprise, Frank came to me a few minutes afterward and said, 'Uncle Floyd, I feel that I should tell you that I have done the same thing for which you are disciplining William.'"

He then turned to Frank and said, "It was a mighty manly thing for you to do, Frank, and I am very proud of you."

During the next few minutes I was introduced to six other boys who gave me the same kind of handshake and the same cordial greeting that I had received from Frank.

Two of the boys seated themselves on each side of Mr. Starr, who occupied a settee, and with their arms around him they sat watching him admiringly, as we discussed the general working plans of the Commonwealth.—I began to understand.

Not once did Mr. Starr refer to any of the past that might be in the least embarrassing to the boys present, or discrediting to any of the other boys.

A bell announced dinner, and soon the seven boys and I, with Mr. Starr as host, were seated in the dining room of Gladsome Cottage. The meal was a wholesome one, served in courses, but the thing that impressed me most was the perfect table etiquette of all the boys and the ease with which they handled themselves. And it was not being staged for my benefit, it was just their natural way—they had ceased to know any other way.

A merry load of energy capable of development.

I spent the greater part of the first evening with Mr. Starr and the seven boys who live at Gladsome Cottage, and I could not help noticing that with every word the boys uttered and every look they gave Mr. Starr, it was plainly evident that they recognized him as their true friend and benefactor.

I was fast coming to an understanding of what Mr. Starr meant when he told me that I would understand the secret of his success with his boys before I left.

It was a love that made it easier for them to do good than to do anything that would displease or grieve the man who had proved his faith in them by devoting his life to their individual interests.

It has always been Mr. Starr's policy to keep the boys from commitment to a state institution, and in most cases he has succeeded in having the boys placed in his care by the judge without sentence being passed upon them, so that the stigma of a criminal record is avoided whenever it is possible to do so.

To illustrate Mr. Starr's methods of handling the boys, I will tell of one case, without going too much into details. This particular lad had been known to commit several petty larceny offenses, and he was finally caught by a storekeeper and a night watch almost in the very act of emptying the money drawer. He was locked up over Sunday, during which time Mr. Starr heard of the case and upon arriving in the town, saw the judge and asked that the boy be turned over to him.

The judge remonstrated, "Mr. Starr, you do not know what you are asking. The boy is a natural-born criminal, and is headed for the state prison just as soon as he is old enough—the only place for him now is in the boys' state industrial school."

Mr. Starr could not persuade the judge to give him an opportunity to save the boy, but after the intervention of several influential citizens, the judge finally suggested that Mr. Starr hear the case against the boy, and that he would then consider the matter, if Mr. Starr still wanted him.

The hearing was held and seven business men appeared against the boy. They painted his past as black as it could be painted. After the evidence was all in, the judge turned to Mr. Starr and said, "Well, you have heard the evidence—do you still want him?"

To which Mr. Starr promptly replied, "I most certainly do, Your Honor."

The judge finally consented, and when Mr. Starr and the boy arrived at the Commonwealth, he took the lad into his office and gave him this talk:

"You of course know that I heard every word those men said about you—and they made you out to be a very bad boy that would steal anything and everything you could lay your hands on. Well, I want to tell you that I do not believe it. No one can make me believe that you are a bad boy at heart, and to prove that I have absolute confidence in you, I want to tell you that here in my desk is a drawer in which we keep the money of the Commonwealth family. Neither the desk nor the drawer is ever locked. You will sleep upstairs, and, if you want to, you can come down stairs any night, help yourself to the money and go out the front door and escape without any trouble. But I know you won't, because I know that you are honest and that you are going to prove it to all those men who testified against you today."

One year later that boy was given a loving cup by the State Sunday School Association for being the best Sunday school pupil entering a certain contest. He made good right from the start, and he has made good ever since.

The boy left the Commonwealth some time ago and became a worthy and valuable workman in a manufacturing plant.

Mr. Starr also told of the expression of gratitude of a father and mother whose son had been saved from a life of vice and crime, and while Mr. Starr could not permit the sacrifice they offered to make, it is so commendable that it bears repeating.

After their boy had returned home and they saw the wonderful change in him, they were so delighted that they wanted to do something to help the work along, and so they proposed to give five years of their time, without compensation, at farm work as arranged by Mr. Starr. They were poor people and had reached the shady side of life, and he told them that such a sacrifice would not be fair to them nor to the boy.

One of the most noticeable features of the Commonwealth is the absence of institutional discipline. Mr. Starr has always endeavored to keep away from every form of discipline that would cause the boys to feel that the Commonwealth was in any sense an institution. The home spirit prevails everywhere, and while there are rules and regulations, they become customs and daily habits rather than red tape.

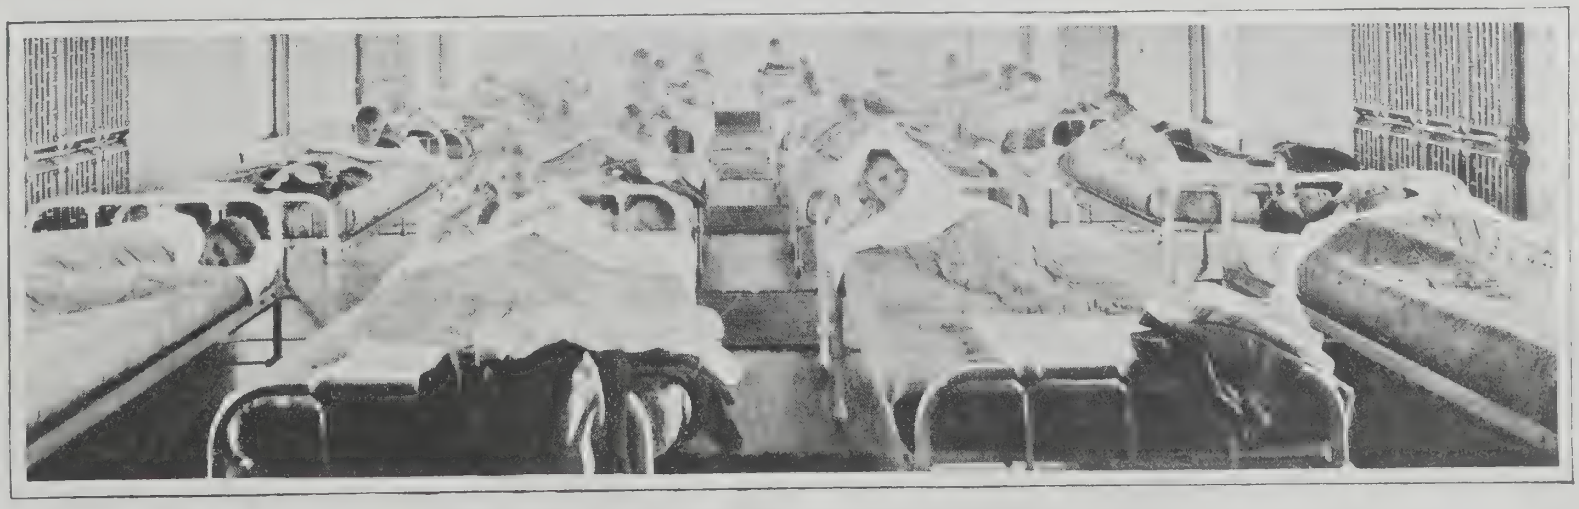
One cannot help noticing the perfect order in which the buildings are kept, and the work is mostly done by the boys.

I was particularly impressed with the condition of the furniture and the walls—not a scratch nor a mar could be noticed anywhere, and when you understand that Newton Hall has thirty-one boys, six to twelve years of age, you who have one or two real live youngsters in your homes will marvel when I tell you that Newton Hall is free from any signs of "wear and tear," such as one would naturally expect to find.

There is an atmosphere of refinement and culture everywhere, and not only does Mr. Starr give much attention to the boys' manners, but their taste for art and music and literature is being daily cultivated by bringing them in contact with nothing but the best.

Their library contains only standard and accepted works of the best authors. The pictures on the walls of the different buildings are either the originals of noted painters or reproductions of the world's masterpieces. The phonograph records and the rolls for the electric player, which is attached to their Baby Grand, are all classics.

(Concluded on page 15)



Individual beds, plenty of fresh air, no pillows, are the principal features of the dormitories.

Shall the Youth of America Be Exploited?

Concluded from page 10

what would have been done with the 700,000 American boys and girls in the farm clubs of this country if Mr. Guard and Mr. Sapiro had had their way about it.

But, neither Mr. Guard nor Mr. Sapiro were able to carry out their plans with the American Farm Bureau Federation, or the National Committee on Boys' and Girls' Club Work.

So, Mr. Guard went over to Mr. Julius Rosenwald, president of Sears, Roebuck and Company, a mail-order house in Chicago.

It is not of record that Mr. Rosenwald was or is particularly interested in the welfare of the boys and girls of America. But when it was pointed out to him that here was an opportunity to obtain and train as permanent customers of Sears, Roebuck and Company nearly three-quarters of a million of young Americans, who soon would be full-grown Americans, his interest was aroused.

The result of this was the establishment of the Sears, Roebuck Agricultural Foundation, with Mr. Samuel R. Guard as director.

Mr. Noble Says "No"

ONCE again, it was "rule or ruin." The Jews had learned they could not rule the American Farm Bureau Federation and the National Committee on Boys' and Girls' Club Work, and were determined to ruin both. In December, 1923, shortly after Mr. Guard took the idea to Mr. Rosenwald, a representative of the Sears, Roebuck Agricultural Foundation appeared before the committee on boys' and girls' club work and offered to pay all the expenses of the boys' and girls' club work—now borne by subscription among the "packers and publishers and other interests" above mentioned by Mr. Guard. The only return wanted for this financing was "complete control and direction of all the boys' and girls' clubs in America." The expenses of the committee amount to rather more than $40,000 a year, and Mr. Noble was informed that not only would this be paid, but that "no reasonable limit would be set on the funds expended to do the work."

That is to say, the Sears, Roebuck Agricultural Foundation endeavored to *buy* the organization of boys' and girls' clubs of these United States, an organization at whose head stands the President of the United States, and divert it to its own uses and to the uses of the ring which is now around the neck of the American farmer.

But once more Mr. Noble said "No," and the Sears, Roebuck representative went back. If Mr. Guard's memory is faulty as to this attempted transaction, he would do well to remember his own whereabouts on the day on which this offer was made.

Taking this refusal as final, however, the Sears, Roebuck Foundation set out, and, on March 13, 1924, a letter was sent to every member of the American Farm Bureau Federation and to every boy and girl in the Boys' and Girls' Farm Clubs of this country. This letter was written on the stationery of the foundation, and signed by Samuel R. Guard as director. In this letter, which is here made public for the first time, Mr. Guard said:

> "A little more than three months ago, I resigned as publicity director for the American Farm Bureau Federation and came here to organize a Sears, Roebuck Agricultural Foundation. My instructions are to erect an organization which will render a real service to American agriculture. If we can measure up to this challenge, *there is no reasonable limit to the funds available for this purpose.*
>
> "Our research division is functioning preliminarily in correlating and interpreting basic agricultural data, *particularly such as bears upon the marketing problem.*
>
> "Our radio division is now building a radio broadcasting station on the roof of our Chicago store. Ours will be a 500-watt station with a wave length of 448 meters . . . . and we hope to perfect the best exclusively agricultural broadcasting station in America.
>
> "The next division to begin work will be the boys' and girls' club work. Here, we intend to enter the field as an organizing factor *to demonstrate what we believe to be the proper plan for organizing the junior farmers of America under a complete program for making farming a satisfactory life.* In addition to financial aid to counties which accept our plan of organization, we shall also offer individual prizes to boy and girl club members.
>
> "In addition to these, we have plans for five other divisions, though I prefer not to explain them until we have been able to organize them for work."

All these departments to which Mr. Guard refers in this interesting document—which, by the way, was not intended for publication—have been established. The research department is rendering favorable reports on the Sapiro Plan of Co-operative Marketing; the radio division has its plant working, broadcasting the propaganda of the Sapiro Plan, and *selling thousands of radio receiving sets for Sears, Roebuck;* while hundreds of cash and other prizes have been offered to boys and girls who will desert the already established clubs and join the Sears, Roebuck clubs, for their work and production from the farm.

It was announced at the time that Mr. Guard joined the Sears, Roebuck Agricultural Foundation that Mr. Julius Rosenwald had put up half a million dollars for the work of the foundation. To the best of the writer's information and belief, less than $100,000 has been so put up, and it is more than probable that *the profits on the radio receiving sets now being sold to the boys and girls of this country through the advertising given by the Sears, Roebuck station will return this sum in profit within the present year.*

In other words, the establishment of the Sears, Roebuck Agricultural Foundation was a good thing for the philanthropic Mr. Rosenwald, a good thing for Mr. Sapiro and his backers in the scheme to exploit American agriculture, and a good thing for Mr. Guard. It has not been of any benefit to the American boys and girls, and still less to their parents down on the farm. That, however, was to be expected. What we need to remember is, not that Mr. Rosenwald is profiting nor that Mr. Sapiro has found a new method of disseminating his fatuous plan of co-operative marketing, nor that Mr. Guard has a job.

> What we must remember is that here is a distinct, announced, well-financed effort to discredit and destroy two important, necessary and successful American institutions—the American Farm Bureau Federation, and the National Committee on Boys' and Girls' Club Work. We must remember that this effort is being made, not by other Americans because they think they have better methods of doing this work than have these American organizations, but by men of alien derivation to whom this country has been a haven of refuge; who have found in these United States a tolerance of their methods and a protection for their lives such as has been given them by no other nation on earth. The reason for this attack on two well-established American institutions is twofold: First, to make money for the individual Jew; and, second, to increase the grip of the national and international Jewish organizations on the farmers of America. These are the things to remember.

The Lure of Financial Aid

IN THE effort to establish the Sears, Roebuck Agricultural Foundation by the destruction of the American Farm Bureau Federation, and the Sears, Roebuck Junior Farm Bureaus by the elimination of the present Boys' and Girls' Farm Clubs, *the lure of the financial aid was dangled in front of the agricultural departments of every state, and before the eyes of the officials of all our state universities,* since it is in part through these universities that the National Committee on Boys' and Girls' Club Work has been able to function so successfully.

Up to June 30, 1924, only one state had accepted the Sears, Roebuck offer, insofar as the writer has been able to learn. This state was Arizona, and the University of Arizona, at Tucson, was the medium through which the plan was put into effect. To the press of Arizona was sent publicity as follows:

> "A full school year's expenses to the best club boy and also the best club girl in this state is the offer of the Sears, Roebuck Agricultural Foundation, as announced by S. R. Guard, its director, and B. H. Darrow, in charge of boys' and girls' work. As part of our program for the boys and girls of the nation, we wish to help some of the most alert and ambitious ones to prepare themselves for the leadership of the rural America of tomorrow.
>
> "We can conceive of no better way to do this than by helping the best 4-H club boy and girl in each state to get a college education. Accordingly, *we are offering every state extension leader these scholarships,* to be awarded by judges appointed by him, in counsel with a preceptor of scholarships appointed by the Foundation.
>
> "Inquiries may be addressed to the assistant state leader, A. B. Ballantyne, University of Arizona, Tucson, Ariz.; or to B. H. Darrow, boys' and girls' work department of the Sears, Roebuck Agricultural Foundation, Chicago, Illinois."

Throughout this discussion, and especially with reference to the effort to inject this private venture into the state universities of this country, it should be remembered that the Sears, Roebuck Agricultural Foundation *is a part of the advertising department of the* Sears, Roebuck and Company, and that *its expenses are charged to the account of that advertising department.*

These expenses are not charged to charity, nor to Mr. Julius Rosenwald's private account, but to advertising, because it is in the shape of advertising that Mr. Julius Rosenwald expects to get his money back.

Some Questions

TO THIS end, the monopolization of the farm radio broadcasting field by the Sears, Roebuck station in Chicago has been made an accomplished fact.

Except for this advertising scheme, it may not be clear just why a private merchandising establishment—which Sears, Roebuck and Company is—should be interested in the establishment of an agricultural foundation. Following this line of thought, it might be well for the American farmer, approached by one of the Gentile agents of this Jewish scheme, to ask a few questions. He might, for example, ask:

If the Sears, Roebuck Foundation duplicates the activities of the already established, government-supported farm organizations, what is its value, and if it does not duplicate them, what new service does it offer the American farmer?

Does the Sears, Roebuck Agricultural Foundation seek to substitute itself for existing state and national organizations of similar characters?

Why should a private corporation, such as Sears, Roebuck, add to its expenses those of such a foundation, unless it expects a return from such investment, and, what return does it expect?

How does Mr. Rosenwald, or the advertising department of Sears, Roebuck and Company, account, in its income tax statement, for funds so expended, and if it deducts such sum—placed by Mr. Guard at $500,000—does not the farmer ultimately have to make up this tax-loss to the Federal government?

Whence, and from whom, came the "demand" which Mr. Rosenwald, through Mr. Guard, declares influenced him to establish this foundation? Was it from the farmer, or from the Sapiro agents who have led so many farmers to disaster through their acceptance of the Sapiro Plan?

If anyone can persuade Mr. Rosenwald, Mr. Sapiro or Mr. Guard to answer these questions logically, and honestly, he will have conferred a definite favor on the agricultural industry of America.

Under the Flag of Black-and-White

—By D. LANGE

SHEEGAWK, the skunk, leads the life of a contented philosopher. He takes good and evil as it comes to him, and is not afraid of either man or beast.

He has three reasons for never running away from an enemy. He is not a good runner, he knows that most of his possible enemies are afraid of him, and his defensive smell-gun is always loaded and never misses fire.

Young skunks make interesting pets.

If either by design or by accident, sheegawk should enter your tent or camp, it is best to be polite to him and not press his departure too urgently. Being a philosopher, he loves deliberation, and dislikes to be hurried.

A skunk, who lived near a group of camps one summer, had entered my friend's kitchen by a hole made through the cheesecloth wall. My friend's wife, when she discovered the skunk, went calling on a neighbor and sent word to John that there was a visitor in the kitchen who wanted to see him.

John and I found the visitor in the kitchen as reported, where he was busy making a meal of some fresh fish lying on the floor.

"Get out of here!" said John, as he gently opened the door. Sheegawk turned his gun end toward us and raised his black-and-white flag. As neither the kitchen nor the visitor belonged to me, I felt justified in stepping behind John.

John did not advance any farther, but repeated his invitation: "You get out of here!"

Sheegawk took a good look at us, but did not seem to remember how he had entered the kitchen. However, when he had become convinced that we were not going to get rough, he began to look in earnest for the exit; and in a few minutes he slipped out of the hole through which he had entered, leaving no trace of his presence.

On a fine afternoon the same summer, I was sitting on a chair in front of my tent reading. My attention was attracted by a rustling in the leaves, and I saw sheegawk coming slowly toward me.

I closed my book and watched him. His tail almost touched my feet. He stopped and looked at me, and I looked at him. After scrutinizing me a moment, he decided that I was a safe and friendly neighbor, and he went on nosing for worms and grubs in the dead forest leaves.

I knew that sheegawk lived and foraged near my tent, and I took the precaution never to leave any food in my tent, but always hung it up in a tree, and thus we passed the summer as peaceful and friendly neighbors.

Skunks are, generally speaking, useful animals that live on insects, grubs and other small creatures, but they will eat birds and eggs, if they happen to find them. Every spring they dig out and eat thousands of turtle eggs.

The scent-glands are not developed in young skunks, and they make interesting and very affectionate pets.

F. M. Wingate, Octogenarian, Believes That It Is Never Too Late to Win

By HARRY H. DUNN

"IF YOU want to defeat women candidates for office at the polls, appeal to the women's vote." This is the discovery of an eighty-four-year-old successful candidate for office in Mississippi, who by this method defeated not one, but two, lady rivals for the same office in the 1923 elections.

He is Captain F. M. Wingate, born eighty-four years ago in Covington County, Mississippi, and discharged from the Western Army of the Confederacy in 1864, with the rank of captain on the staff of Brigadier-General Scott. When he volunteered in the Twelfth Louisiana Regiment, at the beginning of the Civil War, Mr. Wingate was a school teacher, twenty years old. But of all his experiences as a school teacher in the little log schoolhouses of the backwoods of Mississippi, none equaled that of his campaign for court clerk and registrar and notary public in Montgomery County, with its population of less than 10,000. This campaign centered in the city of Winona, where live some 3,500 persons, and where politics—as, in fact, throughout Mississippi—is one of the businesses of life.

Captain Wingate waited until he was eighty-three years old before he "calculated" that he had had enough experience to warrant his going before the people with a request for public office. When he did so, in 1923, he found arrayed against him two prominent women of the community and one man. "I knew I could beat the man," said Captain Wingate to me the other day, "but women are always dangerous rivals, either in business or in politics. So I put some study on defeating these two ladies. First, I thought of retiring from the contest; then I figured some more and the total of my reckoning was that if I did that, I would merely give another man a chance, so I decided I might as well be the man, if a man could be elected.

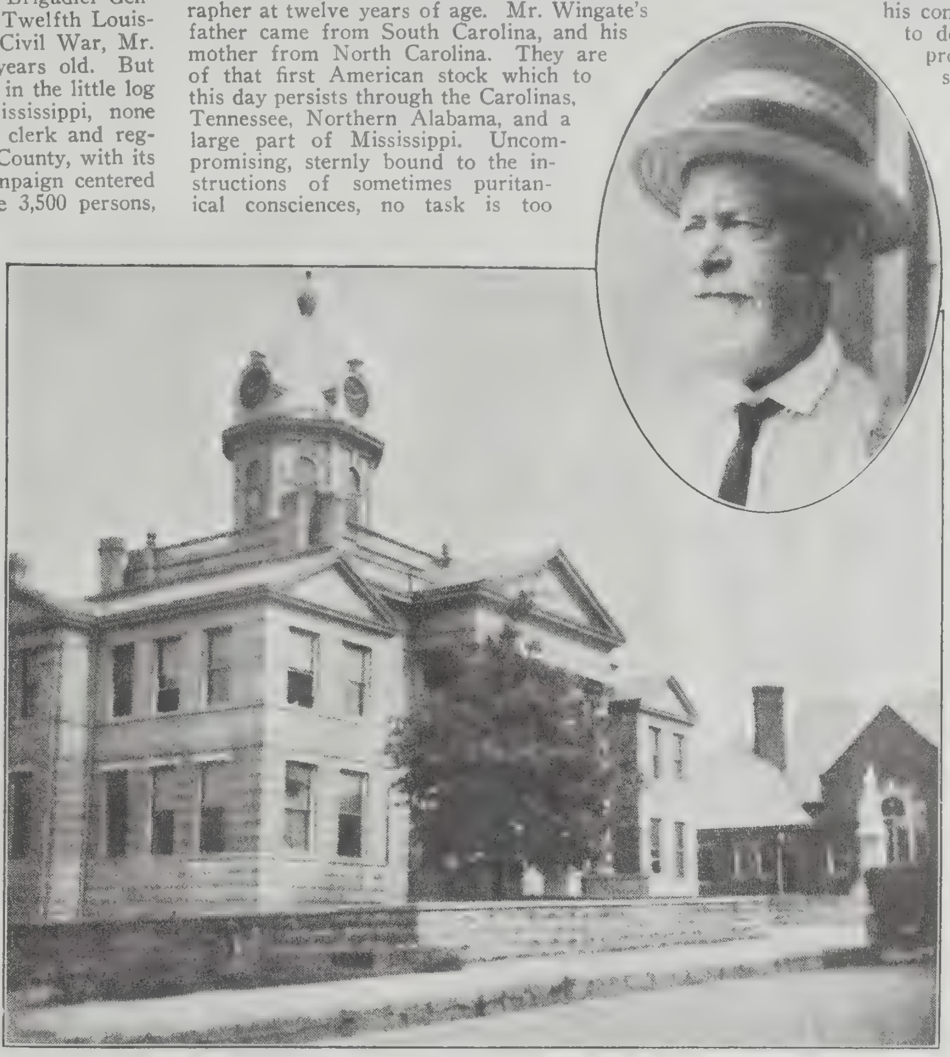
"Old Colonel Scott, before he became a general, used to say, 'If you want to defeat your enemy, organize him,' so I thought I would apply this to my lady opponents, and see if I couldn't organize the voters of their sex. Following this plan, I visited at least eighty per cent of the homes in Montgomery County. While I talked to the men, and asked them for their votes, it was the ladies of the homes to whom I gave the most attention. I organized them into a Wingate party, on the basis that if an old soldier had fought for the ladies of the country, as well as for the country in which the ladies lived, it was only fair return that the ladies should vote for him."

That the eighty-three-year-old Captain Wingate had not forgotten the southern gallantry which marked the young captain of sixty years ago in the Louisiana Volunteers is attested by the fact that he was elected at the first primary in which a candidate, to be victorious, must obtain a majority of all the votes cast, or go into the second primary. In this case, there was no need for a second primary. Even had there been such a need, the second primary would have been a greater victory for the veteran than was the first, because one of his lady rivals, immediately following the first primary, retired, calling upon all those who had voted for her to cast their votes for the captain, if a second primary should be needed.

Then Captain Wingate, not to be outdone by either the lady candidate or the lady voters, made another tour, thanking both of them for the office which had come to him long after he had passed the supposed limit of threescore and ten. "Another factor which helped to elect me," he said, "was that I taught school in Mississippi for a quarter of a century, and all the boys and girls who went to school to me, and thereafter remained in this county, voted for me. I have tried to keep in touch with the majority of them through all the years, and when they saw my name on the ballot they voted for me. Friendship is mighty strong in the South, and memory one of the most binding of ties."

When, in the spring of 1856, at the age of sixteen, he obtained the right to teach in Mississippi—young Wingate moved from Covington County over into Choctaw County, where, after the war, he married. The bride was Miss Fannie Colton, a cousin of Admiral George Dewey. The founder of this branch of the Colton family in America was George Colton, a quartermaster in the colonial troops in the Revolutionary War. The first of their children was born in Choctaw County. Montgomery County was then carved out of Choctaw, taking with it the home of the Wingates, and in this county the second baby was born. Thereafter, Carroll County was taken out of Montgomery County, carrying with it the home of the family, and the third baby was born in Carroll County.

These three boys are now prominent in the business life of Mississippi, where they have lived all their lives, as has their father, except for the period in which he was fighting with the Western Army of the Confederacy. One of them is an official of a railroad; one is cashier in a bank, and the third is a leading automobile dealer of the Magnolia State. The one who is now the banker was the youngest telegraph operator in the world, having held a position as railroad telegrapher at twelve years of age. Mr. Wingate's father came from South Carolina, and his mother from North Carolina. They are of that first American stock which to this day persists through the Carolinas, Tennessee, Northern Alabama, and a large part of Mississippi. Uncompromising, sternly bound to the instructions of sometimes puritanical consciences, no task is too great, no obstacle too difficult, no line of life too hard to follow, if these original Americans know that they are in the right.



Above—F. M. WINGATE, 84-year-old Confederate veteran, who, in his 83d year, defeated two women at the election for clerk of the circuit court, registrar of voters and notary public, of Montgomery County, Mississippi. He defeated his two feminine opponents by winning the votes of the women of the county. Below—Courthouse at Winona, Montgomery County, Mississippi, in which the veteran of the Western Army of the Confederacy still holds the fort which he won with his election to three public offices.

In the midst of the turmoil of the Civil War, Captain Wingate entered Masonry, having been initiated into Cooper Lodge No. 225, Smith County, Mississippi, in August, 1863. He has not returned to attend a meeting of that lodge for sixty years, but in the interim he has passed through a number of degrees, served as an official of the order, and has organized six lodges, becoming Master of each one of them in turn. Like most of the other undertakings in which he has engaged, Masonry has become a matter of deep and serious study to the veteran of the Western Army, and his connection with the order has had no little to do with the fact that Captain Wingate probably is better known, and known personally to more people, in Mississippi, than any other man who has never before held public office in the state.

The octogenarian court clerk, registrar and notary public carries all the work of his office on his own shoulders. He has no assistant, keeps all his records in the copperplate longhand writing of half a century or more ago; attends to all the correspondence of the superior court of the county in the same form of writing, though he uses a typewriter with speed and skill. "Seems to me," he says, "that you cannot keep friends with the people if you write with a typewriter to them, for then your letters are merely business; there is no human touch to them. I need my typewriter for business letters, sometimes, but I find the old pen is best for making and keeping friends."

In the days prior to the Civil War, Captain Wingate's father kept fine horses, as did almost every other plantation owner in the Old South, and the young son of the Wingate household was famous as a rider at every fox hunt and matched race in the state. With clear, keen memory Captain Wingate can tell of riding twenty-five miles to take part in a fox hunt and then riding all day on the trail of the fox; he recalls the men and women, whom, as boys and girls, he taught in his more than a quarter of a century behind the battered desks of Mississippi schoolhouses, and can tell where scores of them are, what they have done with their lives and how they are prospering.

"I have always kept my head cool and my feet warm. I have taken life easy mentally, though not always physically. I have let every day bring on its own joys or troubles, and I have eliminated, as much as possible, the useless striving after the things which are of no final value in life," he said to me, as we stood beneath the pillared entrance to the Montgomery County courthouse at Winona—"and that is why I am able to keep up the work of court clerk at eighty-four."

"There Is No Such Thing as a Bad Boy"

Concluded from page 13

At the Sunday morning meeting, which I attended in the school auditorium, the following piano selections were rendered: "Scherzo" by Chopin, "Rigoletto" by Liszt, "La Campannella" by Liszt.

Some time ago a lady with a musical education was visiting the Commonwealth and she excitedly exclaimed to Mr. Starr, "Where in the world did you get such and such a boy? He must have come from a very refined family, for I just heard him whistling a selection from Pagliacci."

Mr. Starr replied, "He may have come from a refined family, but all I know of him is that he was a waif on the streets of Detroit, and no one knows anything about his parents, his real name, or even his age. We had to give him a birthday."

"But where has he ever heard such classical music?"

"That is the only kind that any of our boys ever hear," was Mr. Starr's reply.

A boy from a well-to-do home had spent two and a half years at the Commonwealth. The lad had an unusually good voice, and Mr. Starr had arranged for him to take vocal culture under the direction of a very good instructor at Albion. Just before the boy was to return to his home, a recital was arranged and his parents were invited to be present. The young man appeared in full dress, and he made a wonderful impression upon the audience as he rendered, "Sing Me a Song of a Lad That Is Gone."

After the recital, the mother of the boy took Mr. Starr by the hand and said, as she crowded back the tears, "I was thinking, while Francis was singing, how true it was that you had taken from us our lad who had given us so much trouble, and now you return to us in his place a perfect man that I am so proud of."

All the boys are taught to work as well as to study constructively. Their work is planned with the view of giving them the correct physical development. Their school hours are the same as the public schools, and their course of study about the same. They get their first year of high school work at the Commonwealth, and are then sent to the Albion High School, and afterward given a college education if they remain with the Commonwealth and are desirous of a higher education. And it now looks as though every boy will want a college education.

The boys are permitted to earn money for themselves and they are adopting many ways of doing it. Some help nearby farmers, some trap, others make bird houses and furniture in their manual training department

The money they earn in this way, or any money that is sent to them by their relatives or friends, is kept in a separate account and they check against it whenever they want any amount from five cents up.

This account would not be complete without telling of a most remarkable record that the Commonwealth had up to the time of my visit—it had never been necessary to have a physician visit them. On a few occasions boys have been taken to Albion to the doctor's office, but they have never had a serious illness of any kind. A most phenomenal record, the secret of which is outdoor exercise, plenty of fresh air in the dormitories, wholesome food and proper eating.

If Mr. Starr has found the answer to one of our greatest economic problems (and there seems to be no doubt about it), then the results that he has obtained during his few years of experience should furnish a working basis for a similar commonwealth in every state of the Union.

His work will continue to grow and expand in Michigan until there will be room in one of the Starr Commonwealth homes for every boy who needs its guiding spirit and influence. And thus the penal institutions will be robbed of that damaging influence that too often is the means of pushing the boy farther on down the hill instead of giving him a place in the world as an honorable citizen.

BRIEFLY TOLD

With the completion of the new transcontinental road in Africa, from Buta, in the Belgian Congo, to Mongalla, in the Sudan, a person will be able to cross Africa in a little more than three weeks.

Since becoming President, Mr. Coolidge has done less traveling than any of his predecessors. Ex-President William Taft was the most traveled, having journeyed 114,558 miles during his term.

In the days of the Roman Empire, criminals were punished by drowning, and the Anglo-Saxon codes condemned women thieves to be drowned. While this form of punishment soon became obsolete it survived in Scotland until 1685 (the year of the drowning of the Wigtown martyrs), and in France was employed as late as 1793.

Bottles containing specimens of 2,800 different sands have been collected by a scientific institute in Chicago.

Mr. and Mrs. Crabtree, of Dubuque, Iowa, are of different political faiths, so compromised by christening their infant son Calvin Woodrow. The boy thus labeled is too young to express his idea as to whether he is honored or not.

The sacred camels of Turkey which set off every year to Mecca laden with rich gifts carry their treasures very haughtily as they are relieved from any ordinary duties.

Excitement is running high in the little fruit town of Peachland, British Columbia. Indians reached Peachland with nearly one hundred dollars in placer gold, and since then parties of aborigines have left for the interior to return with well-filled pouches, but absolutely noncommittal as to the source of their wealth.

Farms absorb three-sevenths of all the steel and iron made.

Tammany is derived from Tamanend, an ancient Indian chief of noble quality. In the Revolutionary War Pennsylvania troops established him as the Patron Saint of America, under the name of St. Tamany.

"Visited a machine at Doctr Franklins (called a Mangle) for pressing, in place of Ironing, clothes from the wash—Which Machine from the facility with which it despatches business is well calculated for Table cloths & such articles as have not pleats & irregular foldings and would be very useful in all large families."—*George Washington's Diary,* Sept. 3, 1787.

The Turkish Government proposes to amend the marriage laws so as to allow only a second wife in exceptional cases; in all other cases polygamy would be considered a crime.

Twenty miles of sewing thread may be used in the making of a fur coat.

The official grave digger of Alken, Germany, has resigned his position because thirteen months have passed without a death in that city. He wrote to the city council declining to accept his salary when there was no work to be done.

In the Chinese language there are forty-thousand written characters which differ from each other.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A serious condition is reported from the Isthmus of Tehuantepec and in sections of the state of Vera Cruz, owing to the appearance of a plague of grasshoppers. Several collisions on the railways in that area have been due to the insects, and the Department of Agriculture has sent out tanks filled with crude petroleum to halt the advance of the grasshopper army.

The United States produces about thirty-five per cent of the world's production of tobacco, which amounts to 4,000,000,000 pounds. Europe absorbs more than eighty-five per cent of the exports from this country.

According to old records, coal was worked in Scotland for the first time in the year 1200, but was not actually mined until 1243. It was not popular for household use, however, until 1591, when the use of chimneys began to increase.

A New York stamp collector has just negotiated for the purchase of two twelve-cent Canadian stamps at a cost of $4,000. The stamps are of the first Canadian issue, and the fact that they are attached, having been taken from the lower left-hand corner of the sheet, and show the printing margin, greatly enhances their value. Only one other set of these stamps is in existence.

The weather man is right eighty-eight times out of every one hundred of his predictions about the weather and temperature. This is claimed by James H. Scarr who has been in charge of New York City's weather bureau for fifteen years. He bases his claim on the forecast of his territory during that time.

The San Gabriel Dam, which will be America's largest dam when completed, will cost $25 000,000 dollars. It will be the first in a program of twelve which the county of Los Angeles will erect to prevent floods and conserve the water in that region.

Since the beginning of the year there have been forty-one thousand criminal cases involving the violation of the prohibition law. Thirty-five, thousand of these have been convicted.

Motion pictures can be made at the rate of twenty-five thousand a second by means of a new apparatus advertised by a subdirector of the Institute Marcy in Paris. The highest speed used in ordinary motion pictures is three hundred a second.

In 1923 the wheat output of this country was 781,737,000 bushels while in 1850 it was only 100,000,000 bushels. The greatest production of 967,979,000 bushels occurred in 1919, due to the pressure of war.

The famous Dogali monument, which was erected in Rome in honor of the first 500 Italian soldiers killed in the battle of Dogali during the Abyssinian War, is to be removed to another part of the city to make way for a street car line. The monument is a slender Egyptian obelisk, and has been admired by tourists for many years.

Eleven major forest fires were blazing in California, Nevada, Oregon and Washington at one time during the first of August. They were supposed to be caused by lightning, and the largest blaze was said to be in the Chelan national forest where more than 600 acres of virgin timber burned.

The Sibylline books were a set of oracular writings which contained the history of the Roman State. They were burned in 404 and 408 A. D. An air of mystery has surrounded them because they were only consulted by members of the senate on special occasions, and whether they contained directions received from the gods or only predictions will always be a matter of conjecture.

The first volume of a revised dictionary of the French language has recently been finished by the French Academy. The volume which contains the letters from A to H has taken forty-six years to complete, having been started in 1878. If an equal amount of time is required to complete the remaining seventeen letters it will take a century to finish the work.

The highest salary ever paid to any French actress, recorded in Paris, was received by Sarah Bernhardt, before the war, when she was paid 10,000 francs, then $2,000, for each of three performances.

The most disastrous earthquake on record occurred in China in 1556, when 830,000 persons were killed.

If an express train traveling at the rate of forty miles an hour were flung into the air it would reach the nearest star after seventy-five million years of continuous flight, with no stoppage or slowing down. This star is 276,000 times the distance that separates us from the sun, or twenty-five billion times from here.—*Dreams of an Astronomer,* by Camille Flammarion.

The cost of living in the United States is 61.7 per cent higher than it was in 1914, and rents are 85 per cent higher than they were at that date.

Despite the restrictive immigration law under which only 357,000 immigrants, theoretically, were to be received into the United States during the fiscal year just ended, the number of immigrants actually admitted to the country was 670,587. This excess is due to some extent to the fact that there are no quota limitations for Canada, Mexico, and Central or South America.

A first issue of the first edition of Dickens' "Pickwick" was sold in London for $7,000. A first of Gray's "Elegy," printed in 1751, sold for $7,750.

What's in a Name—Sweetening the Rose

Change of Name Only Justified When for an Honest Purpose

But It Is Permitted and Practiced for Purposes of Deception

By C. C. DANIELS

Of the New York Bar

THE poet has said "a rose by any other name would smell as sweet," but there are people who do not agree with the statement. Aliases are not confined to the underworld. Many believe that there is commercial, social and political value in names, and the filching of good names goes on in various strata of society. It is said in the Bible—"a good name is rather to be chosen than great riches," but there are perverted individuals who think they can buy good names and thereby increase their riches, acquire credit and secure for themselves position and influence that would be difficult, if not impossible, if they retained the names that they were endowed with at birth and are legally and morally entitled to use.

The "shrewd" and unscrupulous seek to get "something for nothing," and substitute sharp practice for service, endeavoring to "reap where they have not sown." To such nothing is sacred; "all is grist that comes to their mill"; the only question with them is can they "put it over" and "get away with it." The sacrifices of life and the expenditure of effort and energy for the good of others; the devotion of the unselfish ones to science, art and humanity, by which the race is made better and happiness more broadly diffused, speak to the self-seeking appropriator of the product of the brain and heart of others only in the language of the market place; they see only the opportunity to capitalize results and cash in either in money or vanity.

The slick ones are the spiritual reincarnation of Simon the sorcerer, who sought to buy from Christ the power to perform miracles, so that he could make money out of the exercise of this power.

The pages of history contain many names that carry their messages of integrity, patriotism and service to their fellowmen. These names belong not alone to the descendants of those who made them illustrious, but to the world, and they inspire coming generations to greater efforts and higher ideals.

Famous Men Change Names

AN INTERESTING case came up in the New York Court of Appeals in which the right to change a name was involved. (Smith vs. U. S. Casualty Co., 197 N. Y. Rep. 420.) The action was to determine liability on an accident insurance policy, the insured having given his name as the one to which he had changed it without court action, instead of the name received from his father. The court said: "The question presented by this appeal is whether at common law a man can change his name in *good faith* and for an *honest purpose,* by adopting a new one." A change of name by proceedings under the statute was not involved.

In discussing the question the court emphasized the statement that the change of name was "in good faith and for an honest purpose," and among other things said: "As the common law rests so largely upon the customs of the people, it is often necessary to search the history of remote periods both in England and in this country to learn its full scope and meaning. While the legal name of a person now consists of a given name, or one given by his parents, or a surname or one descending from them, history shows that this was not always the case. History of literature and art furnishes many examples of men who abandoned the name of their youth and chose the one made illustrious by their writings or paintings."

Rembrandt had the surname Gerretz, but the son, when his tastes broadened and his hand gained in cunning, changed it to Van Ryn.

A predecessor of Honoré de Balzac was born a Guez, which means beggar, and grew to manhood under that name. When he became conscious of his powers as a writer he selected the surname Balzac. The name afterward became famous.

Voltaire, Molière, Dante, Richelieu and Erasmus were assumed names.

General Grant's baptismal name was Hiram Ulysses, and he bore that name until he was appointed a cadet at West Point as Ulysses Simpson Grant. He entered the military school as U. S. Grant, after which he was known as U. S. Grant.

President Cleveland had the baptismal name of Stephen G. Cleveland. Afterward he omitted the name Stephen and was known throughout his distinguished career as Grover Cleveland.

The Encyclopedia and Law of Procedure says: "It is a custom for persons to bear the surname of their parents, but it is not obligatory. A man may lawfully change his name without resorting to legal proceedings, and for all purposes the name thus assumed will constitute his legal name just as much as if he had borne it from birth."

The American and English Encyclopedia of Law says: "At common law a man may lawfully change his name, or by general usage or habit acquire another name than that originally taken by him, and this without the intervention of either the Sovereign, the Court or Parliament; and the common law, unless changed by statute, of course, obtains in the United States."

The Supreme Court of Pennsylvania says: "That a statute providing for change of name is simply an affirmance and aid of the common law; that it does not repeal the common law by implication or otherwise, but gives an additional method of effecting a change of name. In one respect, however, the statute may limit the common law right, in that it provides that on and after the day specified in the order of the court for the change to take effect, the applicant shall be known by the name which is thereby authorized to be assumed, and by no other name. It may well be, therefore, that after a man has acquired a name by judicial decree, he cannot acquire another without resorting to the courts."

This may possibly account for the persistent objection of those who often change their names, to a law making it obligatory to apply to the courts for change of name, since they might be bound by judicial action and could not thereafter legally go by more than one name.

It is a violation of the law fraudulently to misrepresent the character, quality or quantity of property which is the basis upon which stocks are issued and bonds sold for the purpose of deceiving investors—and the public endorses such laws.

If one desires to do business under a trade name or as a special partner, the law requires him to register that fact with the proper officer, if he is to secure benefits and escape liabilities provided for by the statute.

The list of the incorporators, directors and officers is usually required to be filed with the names of officers. It is well-nigh impossible, however, to ascertain *the owners of the stock that actually control corporations.* Many of the corporations that have names that sound like "100 per cent American" corporations are owned and controlled by those whose Americanism is only a business asset, expressed in broken English. The report of the Alien Property Custodian of the corporations taken over during the war makes this clear. It is doubtful if fifteen per cent of the real estate in New York City is owned or controlled by people who themselves or their forbears have resided in America two generations. Most of it is held in the name of corporations, and those who control these corporations have invested only a small portion of the value of the property for which they collect the rent. Their names read like the roster of the Anti-Defamation Society, but they know how to collect rents large enough to pay interest on all mortgages and other carrying charges, and leave a neat profit for themselves. If a slump comes, the insurance companies and those who purchase the securities can take the loss. Those who collect the rents are like Artemus Ward who, in speaking of the War of 1860 said that he was perfectly willing to "sacrifice all his wife's relations."

Lodges and Cabots

THE law protects trade names and trade-marks from infringement and appropriation by those who would steal the business of others. But the law makes no effort to protect honored personal names from being appropriated and exploited. Names that have become synonyms for honor and business integrity may be appropriated and exploited and the public deceived with impunity. If the name of a washing powder, a cigaret or a shoe polish is appropriated, the whole machinery of the courts is set in motion to protect "property rights," and the ever handy and overworked "injunction" dynamite bomb is thrown with judicial precision.

The larceny of a name, the appropriation of the reputation of a family built up by generations of service and sacrifice, may be accomplished without attracting so much as a shrug of the judicial shoulder; you can "get away" with this sort of larceny without fear of results; Simon the sorcerer is permitted to perform this sort of miracle and collect "all the traffic will bear."

In the *Saturday Evening Post* of March 29, 1924, appears an article by James Kerney, giving "Last Talks With Woodrow Wilson," in which he says that Mr. Wilson got a lot of fun out of repeating the revised version of the old Massachusetts limerick about where the "Lodges speak only to Cabots and the Cabots speak only to God." Mr. Wilson is credited with saying: "You recall how that family of Kabotskis in Philadelphia tried to change the name to Cabot, and how the Cabots went to court for an injunction, and so the limerick had to be made over," and with a twinkle in his eye repeated the revision:

> "Here's to Massachusetts,
> The land of the bean and the cod,
> Where the Lodges can't speak to the Cabots
> Because the Cabots speak Yiddish, begob."

No legal steps are necessary to change a name; the law is not violated by discarding the name by which the family has been known for generations, but, unless there is some unusual reason to the contrary, people whose forbears have lived such lives as to gain the respect and esteem of their fellows usually retain the names acquired at birth. Sometimes, however, persons prefer their mother's name to that of the father, and that accounts for change of name in a few cases. But often the motive back of a change of name is deception and financial advantage.

Those of the race who most often change their names, or go under two names, grow indignant when any suggestion is made that they are wanting in pride of race. A man who spent a great deal of time in Russia and China, during and immediately after the war, says that good old American names like Gordon and Marshall were the names borne by Russian Jews who could scarcely speak a word of English, and whose real names exhausted the alphabet. They had, however, spent enough time in America to be judicially declared American citizens, assume honored names, and go back across the water with the American flag wrapped around them and pose as representatives of "the land of the free and the home of the brave." One reason for the unpopularity of Americans abroad is that so large a proportion of "Americans" usurp the name.

The Shame of Race

IT WOULD be interesting to ascertain how much of the work of our diplomatic representatives in the "uttermost parts of the earth" is devoted to protecting the interests of "American" citizens whose names, like their citizenship, were acquired for purposes of trade.

An even more interesting inquiry would be to learn the number of old American names that have been appropriated and used for business purposes in this country. When one considers how few American names there are on the stores and places of business in the great cities, the natural inference is that those few represent native American stock, but when one ascertains that Mr. Worth was born Goldstein, that Mr. Scott was born Isaacs, and Mr. Harris was born Cohen, one is in doubt whether to condemn this essential shame of race or commend the new taste in American names. In any case the result is confusing and often intentionally deceptive.

An incident illustrating the fact that certain organizations are more or less governed by the names which people bear, and assume that all with names that sound Jewish are a part of their organization ready to contribute to maintain the solidarity of the race, was that of a man who had a name that sounded like a typical Jewish name. An appeal for funds by one of the Jewish societies was made to him by letter. He replied that he was not a Jew but an American of old American stock, and a Presbyterian, but that if the society would write Mr. Columbus Smith of that town, it could doubtless get a liberal contribution, as he was the leading Jew of that section.

A friend who was in the "oil game" told me that he had dealings by mail and wire of long duration with one who went by the name of (we will say) Pat McKenzie, and he, of course, expected to see either a canny Scotchman or a two-fisted Irishman. One day Pat came in his office and he proved to be an undersized Jew, wearing a plug hat and speaking broken English—and he said in substance, "You didn't expect to see a Jew, did you? I thought I could do better business if I took a name that did not show my race, but which made people think I was either Scotch or Irish."

If a name has commercial value, why may it not be appropriated? If the only thing in life worth having is that which is represented by money and business, why should not the Lodges learn to speak Yiddish, so that when the Kabotskis by court decree Americanize their names into Cabot, they may converse together and discuss the achievements of the old families of New England?

Frances E. Willard School, a Mother's Shrine

A Woman Who Stands Among the Immortals

By FRED L. HOLMES

ONLY one woman's statue stands in the crowded hall of immortals at the National Capitol. More than a thousand miles away in the rich, alluvial Rock River valley of the Upper Mississippi basin, the schoolhouse which she attended as a child has been transformed recently into a shrine. In a thousand cities and villages over the land her picture hangs on the walls of homes and women's club rooms.

Fifty years ago this autumn, Frances E. Willard gave up teaching to devote her life to the temperance cause. She planted the seeds of sobriety which twenty years after her death led to the passage of the Eighteenth Amendment. But recognition preceded this constitutional victory. Scanning the scroll of immortals, the legislature of Illinois, passed by its giants in the political and military arena and recommended this woman for the garland of fame. She was the first of her sex to stand in the chiseled marble of Statuary Hall at Washington.

The organization and building of the W. C. T. U. was her life's work. It has been a moral force of incalculable good in the world. Golden jubilees will be held this year all over the nation with the avowed aim of augmenting the membership to one million.

The nation's tribute is fitting as a worldly recognition. But the plain folk of the prairies, where she lived, sought out another. In the wide, free fields which were her playgrounds in childhood, traversed by the Rock River, which goes rushing to join the Mississippi, and surrounded by primeval woods, they found the little box country schoolhouse in which she received her early lessons. Recently where the "woods impressed her unfolding soul with their vastness and vital calmness," this building was dedicated. Probably more American mothers and daughters visit this spot than any other of the many hallowed grounds of the United States.

There is nothing singular about the old-fashioned, white country school. Sorrow-laden by the scenes of misfortune, resulting from a visit at the state institution for the care of the blind near Janesville, Wisconsin, one spring morning, an official party, with which I was traveling, started out for a view of the surrounding country. Scarcely a mile had been traversed when we came to the schoolhouse. Although it was early, the cars of tourists were already there for a visit. This was the scene where Nature had educated this inspiring woman leader. Here she had attended school after the age of fourteen years. Over there was the little pine desk where she dreamed of a bigger and broader field of work.

Around the doorway of the building stood three mothers. Each wore a delicate bow of white ribbon on her waist. It was the mothers of the land whom this apostle of women had inspired to co-operation.

"It was a beautiful little schoolhouse," was the comment of one, as we stood with the group examining the repainted building.

"I think it appropriate that the drab color has been covered with the purest white," responded another. "This was her color."

"She must have lived nearby," commented a third. "Let us find her old home while we are here."

Joining them in the walk to the Willard farm, we learned that these three families had come from Iowa and that it had long been the ambition of the mothers to visit this schoolhouse shrine.

Farm emergencies have destroyed the house. New owners occupy the home. A part of it has been moved away. The main section is now used as a chicken house and machine shed. Apple trees planted by the father of Frances were scattering their white, scented petals, like snow, about the relocated building. Down the road groups of others were now coming up.

Through her busy life, Miss Willard never forgot "Forest Home." To her the Rock River valley was a scene to be remembered. Shortly before her death she wrote these prayerful words referring to her farm residence near Janesville: "I thank Thee that wherever I may dwell, no place can be so dear, so completely embalmed in my heart, so truly the best beloved of all to me as 'Forest Home.'"

The Willards were among the first settlers in Rock County, Wisconsin. Frances was born on September 28, 1839, at Churchville, near Rochester, New York, but when she was two years old the immigrant "fever" had gripped her family and they journeyed to Oberlin, Ohio. Five years they paused. Then when Frances was seven years old they traveled 500 miles overland from Ohio to Wisconsin in prairie schooners. Her father drove the first wagon, her brother the second and her mother the third. Beside the mother, through all that jolting tedious journey, huddled Frances and her sister among the heap of pillows, on the father's old writing desk. They settled near the Rock River, one mile from the schoolhouse that has just been dedicated in her honor, and named their homestead "Forest Home."

What an impression this home was to make on her young life to be carried down to future years has been told by Miss Willard: "The bluffs rose about it on the right and left. Groves of oak and hickory were on either hand; a miniature forest of evergreens almost concealed the cottage from the view of passers-by. The air was laden with the perfume of flowers. Through the thick and luxuriant growth of shrubbery were paths which strayed off aimlessly, tempting the feet of the curious down their mysterious aisles." And all about stretched the vast, level, sun-drenched fields of prairie grain.

For twelve years Frances dwelt amid these surroundings, helping her brother and sister in the work of the farm and doing all the irksome tasks that fell to early pioneers in a new country.

Statue of Frances E. Willard, the only woman in Statuary Hall at Washington.

"Reared in the country, I was absolutely ignorant of tight shoes, corsets or extinguisher bonnets," said Miss Willard, describing these early days in Rock County. "Clad during three-fourths of the year in flannel suits, not unlike those worn at gymnastics now by lady collegians, I spent most of my time in the open air, the companion in work as well as in sport of my only brother. I knew much more about handling rake and hoe than I did of frying pan and needle; knew the name and use of every implement handled by carpenter and joiner; could herd the sheep all day and never tire; was an enthusiastic poultry raiser; and by means of this natural outdoor life, eight or nine hours of sleep in twenty-four, a sensible manner of dress, and a plain fare of bread and butter, vegetables, eggs, fruit and fowl, was enabled to store up electricity for the time to come."

When Frances was fourteen years old, her father and neighbors built a schoolhouse one mile from "Forest Home"—a plain little one-room building under the oak trees on the bank of the Rock River. The pine desks were arranged along the side of the wall, and the boys sat on one side and the girls on the other. Here Frances was sent to school in 1853, her first teacher being Nelson W. Hodge, whose children and grandchildren have since taken an important part as educators in Wisconsin and Massachusetts.

Additional schooling was given to Miss Willard at Northwestern Female College, now Northwestern University, and after graduation she was made professor of natural sciences in the institution. Scattered over the Mississippi Valley are women who studied under Miss Willard. When she took up her temperance work they were her first disciples.

While engaged in teaching she became interested in the temperance reform movement and, in 1874, fifty years ago, she became secretary of the Woman's Christian Temperance Union. Five years later she was chosen president, a position she held until death. In later life she made her home at Evanston, Illinois. She was a great organizer and under her

United States Not a Militaristic Nation

Countries Following Same System Would Reduce Army Expenditures

By TOM EVERRITT

> The statements made in this article are offered as authoritative facts. They throw into relief some points which arose during the discussion of "Defense Test Day." They prove at least that the United States is not a militaristic nation.

WITH greater wealth and responsibility than ever before, the United States maintains one of the smallest armies in the world.

Japan maintains one soldier per $90,000 of national wealth; Italy maintains one soldier per $120,000 of national wealth; France maintains one soldier per $133,000 of national wealth; Great Britain maintains one soldier per $250,000 of national wealth. In striking contrast, the United States maintains one soldier per $2,500,000 of national wealth.

Japan's Active Army numbers 250,000 men; her First Reserves consist of 615,000 men; her Second Reserves 749,000 men and her First National Army comprises 200,000 men—or a total of 1,814,000 soldiers. This immense army can be mobilized within six days; some divisions within five days.

In Japan, military service is compulsory upon the youth of that country. The number of men arriving at the age of twenty years is about 550,000 annually. The period of service with the colors is twenty-two months and twenty days. After this service in the Active Army, the Japanese enlisted man goes into the First or Second Reserves, where he remains until he reaches the retirement age.

Italy's Regular Army numbers 200,000 men; her Colonial Troops, 40,000; the Carabinieri, 65,000 (used chiefly for rural and, in some cases, city police. In war time, they act as mounted police and on lines of communication). The Fascisti, numbering approximately 350,000, are now under direct control of Italian military authorities. They occupy a status similar to that of the United States' National Guard. Italy's total soldiery is about 655,000.

The World's Fighting Men

AS IN Japan, conscription is the source of increment in the Italian army. Classes are called at the age of twenty. Service of eighteen months in the active army is required; but all military service in Italian colonies is by voluntary enlistment.

France's Regular Army with the colors (native Frenchmen) numbers 543,000; the North African Colonials 109,000; her other Colonials 100.000, giving a total active regular army military man-power of 752,000. The Active Reserves of France number 2,040,000; her Territorial Army 1,190,000; her Territorial Reserves 1,190,000, which make a total of 4,420.000 of Reservists and Territorials, which added to the 752,000 regular troops, gives a grand total of 5,172,000 trained soldiers.

In France, men are conscripted into active service at the age of twenty years. The young men of France serve one and one-half years in the Active Army, after which they serve sixteen and one-half years in the First Reserve, which is followed by eight years in the Second Reserve, at the end of which time their usefulness is considered to have expired.

The entire French fighting force can be mobilized and put into the field in from three to five days. Every French Reservist or Territorial (normally about seventy per cent of the males between twenty-two and forty-five) has at all times detailed directions for reporting, so that on telegraphic notification of mobilization, all units are assembled on schedule.

The strength of the British Regular Army at home and abroad (including Colonial and Indian troops in Iraq [Mesopotamia] and Palestine paid by the Air Ministry) is about 165,000 officers and men, who are included in the British Active Army together with the Indian Army composed of 310.000 men; the British Army in India, 77,000; the Egyptian Army, 17,000; the North Ireland Army, 20 000; the South Ireland Army, 45,000, and troops in smaller numbers in Canada, South Africa, Australia and New Zealand sufficient to make a total of 654,750 officers and men in the Active Army of the British Empire.

Great Britain's Forces

GREAT BRITAIN'S Reserve Army numbers 390,000, comprised of 138,000 English Territorials, who are not supposed to leave England except under a special act of Parliament; 68,000 English Reserves; 75,000 Indian Reserves; 57,000 Canadian Militia; 7,000 South African Militia; 30,000 Australian Militia and 15,000 New Zealand Militia. This Reserve Army is comparable to the National Guard of the United States.

Great Britain does not have compulsory service; but her advantage, when compared to the United States, lies in having larger standing forces and more militia.

Germany's Regular Army has an authorized strength of 100,000; her Security Police (in barracks) 90,000; Security Police (not in barracks) 60,000, thus making a total military man-power of 250.000. The Regular Army of Germany is limited by the Versailles Treaty to 4,000 officers and military officials with officer rank, and 96,000 men. The same treaty forbids Germany from establishing a war organization. For this reason, there are no plans (unless secret) for the mobilization of the active divisions.

The statute of March 23, 1921, stipulates abolition of obligatory military training. The Security Police is militarized as regards command and training, and is well armed. The male population of Germany is about 30,000,000, of which approximately 11,800,000 are of military age (eighteen to forty-five years).

Russia has a total force of 700,000 soldiers under arms. The Regular Army is composed of 550,000 and the State Political Department troops number 150,000. This latter organization is the successor of the "Cheka," or secret police. It is largely composed of Communists. Its main functions are to guard all frontiers; the maintenance of internal order and the frustration of attempts at counter-revolution. It is the main reliance of the government and the Communist party. It uses 60,000 troops to guard the frontiers and 90,000 for duty in the interior.

Liability to call for military service extends to all male citizens, who, on January 1, have reached the age of sixteen years. Service is divided into four periods, followed by enrollment in the reserve. Youths between the ages of sixteen and eighteen years under compulsory preliminary physical and elementary military training not exceeding four weeks. This is followed by pre-conscription training for those between the ages of eighteen and twenty years not exceeding ten weeks. At twenty years of age, service in the Regular Army begins; at twenty-one, service in Territorial divisions which extends for four years commences. After this, the men are transferred to the Organized Reserve which now numbers about 235,000 men. Those showing efficiency, pass from the Organized Reserve into the Unorganized Reserve, which numbers 4,500,000.

The interesting feature of the Russian system lies in the formation of the territorial divisions, the creation of which seems to have been made with the idea of alleviating the burden of maintaining a large regular army. It will provide a huge trained military force and practically creates a nation in arms.

America's Military System

THE Army of the United States is composed of the Regular Army, the National Guard and the Reserves. The Regular Army has a strength of 136,776 officers and men; the National Guard has a strength of 165,179 officers and men, while the Reserve Officer strength is 72,132. These give a total of 374,087 trained and partially trained men.

The National Guard of the United States is fairly well equipped, and is in better military shape than ever before. Regular Army instructors, who, in reality, are military advisers to the National Guard, are on duty throughout the country.

In a major emergency, the Army of the United States would have to have fifty-four divisions, which would require the Regular Army to expand nine times its present size, and the National Guard to expand eight times its present strength. This indicates that the problem of the United States military forces is one of expansion.

American military experts base their army mobilization plans upon a formula that would place 2,000,000 fighting men in the field within nine months. It is absolutely impossible for the United States to reach the precision of the French military organization which can put a trained force of 2,000,000 men under twenty-five years of age into the field within three weeks. In the United States, the time required to train a like number of troops, and the time consumed in manufacturing and furnishing supplies and equipment, will amount to at least nine months.

How Other Nations Would Benefit

HOW to secure the adoption by other nations of the United States' army system, thus bringing them to the same level, is a problem that is confronting army experts, since it is believed the people of the United States will not, in peace times, consent to a tremendous standing army.

Amounts of expenditures per person for military purposes in various countries, converted into United States currency at par rate of exchange, show considerable divergence.

France heads the list, the estimated per capita cost of her military machine for 1924 being given at $22.33; Italy next with $9.50, followed by Great Britain with $6.40, in turn followed by Japan with $2.60, while the United States per capita expenditure during 1924 will be only $2.20, which is based upon a Congressional appropriation of $245,216,650 for the maintenance and upkeep of the United States Regular Army.

By adopting the system of the United States' military machine, the nations mentioned would greatly reduce their military expenditures.

Having compared the United States Army with other armies on the basis of national wealth, numerical strength per capita cost and along other lines, it is interesting to compare it on a basis of population.

France maintains 19.13 soldiers for each 1,000 of population; Russia, 7.05; Italy, 6.44; Great Britain, 5.43; Japan, 4.80; Germany, 1.64; and the United States maintains 1.24 soldiers for each 1,000 population.

The Neutrality of the Oneidas

By Frances Holbrook Pfeiffer

A FREE translation of the name "Oneida" is said to be "A Rock that Something Set Up," derived from a standing rock near the site of one of their ancient villages. The Oneidas were conservative Indians and not given to great activity; there were, nevertheless, indications of progress among them. They were the second tribe to enter the Indian League of Nations, proposed by Dekanamda and the far-famed Hiawatha, for purposes of security and welfare —a league both offensive and defensive.

The Oneidas retained that prehistoric right of woman chieftainship which gave to women chieftains approximately the same privileges and immunities enjoyed by men chieftains. A more modern tendency was evidenced by the fact that men were chosen by these women to perform governmental duties, except—here note the promise and prophecy for the future!—*except* when emergencies arose. Then the Indian woman, like her white sister, came forth from her wigwam and performed her part in public life.

It is obvious that the Oneidas were not so warlike as their neighbors. At any rate it is recorded of them that they sought to have part in concluding peace between the Hurons and the Senecas in 1635. And in 1775, at the beginning of the Revolution, we know that they declared their neutrality most emphatically, giving specific and—to us, today—remarkably sound reasons for so doing.

Their neutrality speech was directed to Governor Trumbull, of Connecticut, to be communicated by him to the four New England provinces. It was dated from Kanonwarohare and declared a safe conduct for those of the tribe going into New England. This historic address is found in a rare volume, "The History of the American Revolution," by Bernard Hubley, printed for the author in 1805, by Andrew Kennedy, at Northumberland, Pennsylvania, and reads as follows:

As my younger brothers of the New England Indians, who have settled in this vicinity, are now going down to visit their friends and to move up parts of their families that were left behind—with this Belt by them I open the road wide, clearing it of all obstacles, that they may visit their friends and return to their settlements here in peace. We Oneidas are induced to this measure on account of the disagreeable situation of affairs that way; and we hope, by the help of God, they may return in peace. We earnestly recommend them to your charity through their long journey.

Now—we more immediately address you our brother, the governor and the chiefs of New England:

Brothers! We have heard of the unhappy differences and great contention between you and Old England. We wonder greatly and are troubled in our minds.

Brothers! Possess your minds in peace respecting us Indians. We cannot intermeddle in this dispute between two brothers. The quarrel seems to us unnatural. You are two brothers of one blood. We are unwilling to join on either side in such a contest, for we bear an equal affection to both you Old and New England. Should the great King of England apply to us for aid, we shall deny him. If the Colonies apply, we will refuse. The present situation of you two brothers is new and strange to us. We Indians cannot find nor recollect in the traditions of our ancestors, the like case of a similar instance.

Brothers! For these reasons possess your minds in peace, and take no umbrage, that we Indians refuse joining in the contest. We are for peace!

Brothers! Was it an alien, a foreign nation, who had struck you, we should look into the matter. We hope, through the wise government and good pleasure of God, your distresses may be soon removed and the dark clouds dispersed.

Brothers! As we have declared for peace, we desire that you will not apply to our Indian brothers in New England for assistance. Let us Indians be of one mind and live with one another; and you white people settle your disputes among yourselves.

Brothers! We have now declared our minds, please write us, that we may know yours.

We, the Sachems and Warriors and female governesses of Oneida, send our love to you, brother, governor, and to all the other chiefs in New England.

Signed:—by thirteen, long Indian names, four of which may be those of the "feamale Governesses," but of that we cannot be sure unless we understand Oneida.

This ancient tribe has left in New York only its Indian names. By 1846 the Oneidas had disposed of most of their lands in the state and removed to a large tract in Green Bay, Wisconsin; also, over the border into Canada, thereby again expressing their appreciation of a brotherhood without—to them—a boundary line.

Where the Turk First Stepped on Europe

Vivid Mosaics of Constantinople, Rhodes and Beyrouth

By HAL WALKER

A graphic description of Constantinople and the historic island of Rhodes are given in this section of the wonder voyage.

The steeds of Neptune patiently awaiting their riders at Rhodes.

THE war in the Near East, especially the ill-fated expeditions at Gallipoli, where so many Allied soldiers were killed in attempting the impossible feat of dislodging the Turks aided by German officers and material, was brought vividly home to us as we steamed through the Dardanelles, the ancient Hellespont, bound for Constantinople. On every side were grim reminders of the struggle during the early years of the war, reminders which seemed much out of place in the peaceful picture of rolling hills and quiet waters.

As we passed wrecks of once powerful vessels sunk by submarines or mines with only part of their hulls visible, I thought of two of the anecdotes told me in Smyrna by a man who was there during the entire war and who knew much of the armies. The Turks, as Moslems, are forbidden by their religion to drink alcoholic beverages and, as a consequence, take to sweets. With the retreat of the Allied forces great stores were left behind, the British, among other things, leaving a huge quantity of jam. The Turkish soldiers recognized these cans, would stick a bayonet in one end of them and never take the can from their mouths until they had sucked out the last sweet morsel. Naturally they got sick with such a diet and when they reported to the Turkish doctors, who could not diagnose the trouble, the latter shrugged their shoulders and said: "Those cursed English have poisoned our soldiers again."

Another typical story is that of the Turk soldier and the donkey, this also occurring after the Allies had left Gallipoli. The soldier had a donkey heavily laden with army supplies and was beating the animal unmercifully. A German officer, passing with an officer of the Turkish army, called attention to the cruelty the soldier was displaying and the Turk called the soldier over.

"What do you mean, beating a poor donkey that way, don't you know it is cruel and you should be ashamed?" the officer asked.

This bird's-eye view of a Near-Eastern city affords an excellent idea of the beauty of architecture and of landscape effects.

"But, effendi," the soldier replied, "that is not one of our donkeys, it is an English donkey."

Although the wrecks half submerged along the European shore of the Dardanelles were grim reminders of the recent war, there were more touching ones farther away from the water route. On rolling hills, here and there, British flags snapped in the breeze, on guard over holy land below, where rest for eternity the bodies of those men who fought under the British flag and gave their lives to save the world from barbarism.

It was after steaming out of Smyrna and into the Aegean, passing Mytilene, ancient Lesbos, and then in sight of Lemnos that we came finally to the entrance of the Dardanelles, that narrow strip of water which divides, literally by a hand's breadth, the continents of Asia and Europe. Traffic through the strait is a strong reminder of automobiles passing along a crowded thoroughfare at home. There is a never-ending stream of vessels going in each direction with the flag of Greece the most prominent and that of Italy second. Only a few of these many craft were passenger vessels, most were freighters, of the two nations named, which do a big coasting trade in this part of the world.

A short distance beyond Gallipoli, the strait widens out into the Sea of Marmora and for hours we steamed along through waters which had never a ripple except for those made by the wakes of passing vessels. After hours of this, in the late afternoon came Constantinople. Bathed in the radiance of the setting sun and glowing almost golden, Constantinople lay before us, tier on tier of houses rising to the heights of Pera, the domes and minarets of countless mosques punctuating the sky line, with those of St. Sophia dominating all the others.

It is generally conceded that Naples and Constantinople are the two most beautifully situated ports in the world, with the former given the first place. It is my opinion that Constantinople has first place, as it rises majestically from the surrounding waters of the Sea of Marmora, the Golden Horn and the Bosphorus. It has an indefinable something which Naples lacks; perhaps it is the mingling of two religions which have existed side by side for so many hundred years.

The "City of Constantine" was first a Dorian colony founded in the seventh century B. C. and was a Christian city long before Mohammed II took it many centuries later. The mosque of St. Sophia, which is the most beautiful outside of Mecca, was built by Justinian between A. D. 531 and 538 as a Christian church, and was converted into a mosque after the conquest by the Turks in 1453.

With automobiles at our disposal again, we saw all the minor sights of Constantinople before visiting St. Sophia, the greatest attraction of all. In the yard surrounding the mosque we were all searched for cameras, as they are not allowed inside, and then were allowed to enter. There was no crowd of worshipers present, but in various parts of the great edifice were single figures kneeling in prayer on the rich rugs which covered the entire floor, hundreds of square feet in extent, while bright sunlight streaming through stained-glass windows high above sent long shafts of colored light to the rugs below. It is of little use to describe St. Sophia; it has been done many times and well, but the aspect which most impressed me was the devotion manifest by the followers of Mohammed.

In the courtyard, around a sort of kiosk, there were a score or more faucets with running water, and here each worshiper is obliged to wash his hands and face before he enters the mosque for his devotions. It was near the noon hour when we visited St. Sophia, and beggars and laborers rubbed elbows with Turks immaculately dressed in European costume, all performing their cleansing rites before entering the mosque where all men are brothers. Among the worshipers were dapper Turks, some of them carrying brief-cases, evidently business and professional men, who displayed a great tolerance to their less fortunate brothers as they passed beneath the lofty minarets for communion with their God. A good Mohammedan must pray five times daily, facing Mecca.

Constantinople, as all travelers know, is divided into two distinct quarters or even cities, the foreign one which terminates at Pera, where the foreign embassies are located and the prosperous European residents live, and Stamboul which is the real Turkish town, and, in fact, is the Turkish name for all Constantinople. Pera has been spoiled by the influx of European armies which called for much amusement, and as a result cafés and beer gardens were built around the largest square, cheap wooden structures which give a false note to the surroundings of a more ancient time. I like to think of Constantinople from the Turkish side with its wide streets, quiet homes all in peace and darkness after ten o'clock at night, while on the heights of Pera blatant jazz music and bright lights pour fourth until early morning.

Of course, the most interesting part of Constantinople after its mosques are its souks, or great markets, in which there are hundreds of shops, the whole edifice being under a stone roof. One can wander for hours through the maze of narrow streets, really paths, in the most curious market of the world. A guide is necessary to prevent a stranger from getting lost, for the extent of this market and the intricacy of its streets baffle all but the experienced.

There are hundreds of little shops whose fronts are open to the narrow street, and the manufactures of nearly every country in the world are on display. Articles for sale vary from rare jewelry and inlaid weapons to English stockings and American shoes. Each street, or series of streets, is given over to one class of trade, shoes in one, silks in another, jewelry in a third, sewing machines in a fourth, and so on. I saw one street given over to American sewing machines and cheap cotton print goods.

Constantinople is a city of contrasts, the East meets West here even more than in Port Said or Hongkong, and the only aspect that could make it more cosmopolitan would be laden camels passing through its crowded and narrow streets. There are three Sundays in Constantinople, the Mohammedan, Jewish and Christian—coming in order, Friday, Saturday, Sunday—so that on three days in a week there is no general business done. This is vexatious, in banking especially, as the banks take all the holidays.

In two steam launches we spent one afternoon making a trip up the Bosphorus to the Black Sea along one of the most beautiful small bodies of water in the world, which in places runs like a millrace. Past the Sultan's palace, the headquarters of the Near East Relief, and one after another of the homes of rich residents of the city which are situated along the water in large gardens, each home with a water gate through which its boats are taken and then locked behind them, we went mile after mile. Here again were many idle steamers lying at anchor and, halfway to the Black Sea, I descried an American flag on a grassy knoll on the Asiatic side. Nearby were oil tanks, a steamer discharging and houses clustered under a group of trees.

In the narrowest part of the Bosphorus are two ancient forts which with their old-fashioned guns once could halt all traffic passing either up or down, the waterway here being only a few hundred yards wide. It was along this waterway that we noticed two ten-oared barges, such as are used by high Turkish dignitaries of official business, the rowers rising to their feet with the back-sweep of the oars and sitting down as they were brought forward, with the whole strength of the body in the pull, all in perfect rhythm.

Just in the dusk we approached Constantinople on our return, with the glow of the setting sun in the sky. Over the minarets of St. Sophia the new moon appeared.

(Concluded on page 14)

Imposing building along waterfront, whose beauty of line and material is enhanced by the background of trees.

Quaint sea craft and lighthouse, with splendid Eastern architecture of the city as background, cast a spell that charms the traveler in the Near East.

Is Intelligence the Be-All and End-All?

Some Methods of Piercing the "Abysmal Depths of Personality"

By LEWIS WORTHINGTON SMITH

THERE seems to be a growing superstition to the effect that intelligence is the be-all and end-all of man. Our psychologists, following the lead of the French investigator, Alfred Binet, have devised tests of mental capabilities by which our children may be assigned to their several group levels.

Intelligence tests are fairly certain to be of no little importance in the future development of our civilized life. Whether we like them or not, they will probably be applied increasingly. Those of us who have achieved maturity may reasonably hope to escape them, but those who are to make that arrival some years from now cannot entertain that assurance. Many of them will be ticketed and their destinations will be known with a certitude very much greater than that of the friendly confidence or the malicious distrust with which we now look upon the young contenders for the prizes of life. Some of them will perhaps come to the doors of the college, will be asked a number of questions, will be told to do a number of more or less trifling things, and will then be informed that gravel pits and coal mines are just as interesting and are less subject to the depression consequent upon unemployment than are the activities for which we had come to make preparation.

It is not going far out of the way to say that man is chiefly brains and fingers. He thinks things and his fingers turn his thoughts into act and fact. Curiously enough the card-indexing of humanity is now dealing with us as brains and fingers. Our identities, unchangeable and inescapable, are being made matters of record through our fingerprints. If we are criminals we have that character fastened upon us officially by a very simple and sure process calling for nothing more than some white paper, some printer's ink, and the pressure of the hands. If we are honest men we can carry about with us a more convincing evidence of our identity than our signature, because, while a skilled penman may forge our names successfully, no one else can make our fingerprints. In all this there is, it must be confessed, just a prospect that life may become so regimented that it will lose all the glory of adventure with which it has hitherto lured us on. Whether that reflection makes us wish to turn back on the road, to be restored to our illusions and the happy possibilities shut up in an unrealized tomorrow, or not, it is perhaps futile to debate. The road has been opened and we will individually lose ourselves in the company of those who are following it to whatever end it leads.

Ruskin Brings Suspicion

OF THE various tests employed in arriving at what is known as the I. Q., that is, the Intelligence Quotient, of the child under examination, Professor Terman, of Stanford University, says that the "vocabulary test has a far higher value than any other single test of the scale." Reasons for that judgment are worth considering briefly. The possession of a relatively large vocabulary means several things with regard to the child's mentality. The retention of words that have found a place in the mind is, of course, a matter of memory. No bad memory will have at its disposal a large body of words. Again a mind incapable of somewhat close attention will not fasten a word to its signification with sufficient sharpness to make it into a mental possession without a number of repetitions. Further, some considerable alertness of observation is at least suggested by a large vocabulary. Such a vocabulary can be acquired only by those who come into contact with those whose conversation brings many words to their attention or by wide reading. In either case the acquisition of the vocabulary is the mark of mental liveliness and eager curiosity.

All these things, it is to be noted, *memory*, the self-control of *attention, mental alertness, curiosity*, are factors of the *mind working as a machine.* They are no doubt related to tastes and likings. Certainly they must be affected in some ways by personal inclinations. Mere volume of vocabulary cannot, however, be a measure of anything beyond the energy, precision, liveliness of the mental faculties as such. Ability to plan a course is a thing quite independent of those personal qualities through which a man becomes an agreeable or disagreeable member of society. It may enable him either to serve society or to prey upon it. It has very little to do with determining whether he shall employ his talents in one way or the other.

This is a matter of some immediate moment. In the stir of discussion relative to our immigrant problem I have again and again met the assertion that the Japanese, for instance, are as smart as we are, that the Hebrew is often a man of high ability, that there are great names and great achievements in the roll of history to which Italy can point. The army tests of intelligence have shown that those not of the older American stock are perhaps not the intellectual equals of those whom they have followed to the New World. That is a fact of importance, if it is a fact, but there are other things that should be more seriously weighed.

What I want to know about the man who is to live next door to me, who is to be part of my world, who is in some degree to determine its ends and purposes, is not the level of his abilities. I want to know *the nature of his social inclinations.* His code of manners is more important to me than the energy and certitude of his intellectual processes. If he thinks it an admirable thing to sit on his front porch with his feet affronting the street over the railing, even though he has been endowed with a brain approximately matching that of Napoleon, I should be grateful for any domestic or business upheaval that would take him to another street.

I have a feeling that to quote Ruskin in this first quarter of the twentieth century is only to become an object of suspicion. His name seems to have dropped out of current literary recognition almost completely. He was one of the Victorians, and to have belonged to that, with the possible exception of the Elizabethan, most affluent and wonderful age of literary creation is now for a time to be hounded into oblivion by all the execrators of excellence. When the fellowship of Tennyson and Thackeray and Carlyle and Arnold has gone so far into the background of our memories that we can have no jealousies of them as competitors we shall have a Victorian revival. In anticipation of the critical readjustment of more judicial years to come, I venture to bring a word of Ruskin's to mind.

"Tell me what you like and I'll tell you what you are," Ruskin said, perhaps in "Sesame and Lilies," not, I think, in "The Stones of Venice" or "Modern Painters." It belongs not to the youthful enthusiasm of his theorizing about art, but to the sober wisdom of his later years. Personality is a subtle thing, more subtle and evasive than our intellectual processes.

"Thought is deeper than all speech,
  Feeling deeper than all thought;
Souls to souls can never teach
  What unto themselves was taught."

So Christopher Pearse Cranch put the matter, and the lines seem to me memorable. If we are going to know about men and women genuinely, even about children, we must somehow pierce what Tennyson calls "the abysmal depths of personality."

As human beings we differ both quantitatively and qualitatively. Measurements of intelligence reveal in the gross only our *quantitative* differences. Such differences are those only that distinguish us in degree from our fellows, not in kind. They rate us in grades as the miller rates wheat. They do not separate us one group from another as the same miller separates corn and rye. No degree of excellence can change the corn to rye nor persuade the miller that it should be ground up for rye. They are eternally different things. They must grow and flourish in different ways. Woe be to the husbandman forever who scatters his corn broadcast as he scatters rye or who tries to cultivate rye in hills.

It is easier to distinguish rye from corn or wheat from either than it is to be sure about grades in wheat. The qualitative marks are here easier of determination than the quantitative. In making estimate of our human selves this difference in the two processes seems to be reversed. The fingerprints tell us nothing about a man's character. They give no hint of personality or human quality. They are quantitative only, or perhaps formal, if we care to place them in a species of which the quantitative is the genus.

Hardly more do intelligence tests as they have so far been developed reveal our inner selves. If we could all of us so train our intellects that we would observe with equal accuracy, think with equal certitude, and remember with equal clearness, we should so far be undifferentiated logic machines. A man is a man, in addition to being a part of the mechanism of the universe, to the extent in which he is distinguishable from other parts of the mechanism. What a man thinks, the degree in which his brain is an effective instrument for thought, is determined by the material for thought which experience provides him.

It is not probably man's chief glory and delight to be a thinking animal. Often enough, possibly too often, he finds his pleasure in flying in the face of his thoughts, in defying the counsel that they give him. It is a satisfaction to carry through a process of thinking and reach the end with some assurance that the conclusion is reasonably sound. Satisfaction is itself, however, not a matter of thinking, but of feeling. I may give myself an abundance of reasons for believing that I should be happy without really bringing myself to that state of mind. Happiness itself is not a mental state. It comes of the feeling that is deeper than all thought. We are happy when what we like, what our tastes establish in our minds as good, what we desire, exists and exists for us. We cannot reason ourselves into liking a thing at the dictate of our judgment. We may train our minds until in respect to some things they are almost logic comptometers. We cannot so train our inclinations and reduce them to uniformity.

Polishing an Apple

ALL this I should feel to be so fairly obvious as to be hardly worth saying, were it not that in conversation with men of active and well-stored minds I find it one of the things that they have not made a part of their mental furnishing. I am I, not because I could use logarithms in my mathematical calculations, if I chose, as the man passing by my window cannot, but because it is my way to say "How do you do?" or "Good morning," when he says "Hallo, there!" Such facility in the manipulation of numbers as I may have is an accident of my training and environment. My preference for what I think a courteous mode of address is integral to my nature. It comes to me in my blood.

In the same way it is my choice to wash the apple that I eat, not to spit on it before polishing it on the sleeve of my coat as does the Greek fruit vender at the corner.

Even if he were able to pass a higher intelligence test than I, I should still think him disqualified for acceptance among the elect of my fellowship. In fact, his method of making fruit appeal to my desire for something luscious in the mouth drives me to look elsewhere for that sort of sensation on the tongue. A simple American country boy coming along in a wagon, a boy with eyes less bright than the Greek's black ones, has much the better chance of receiving my dime. For me, and I think for all my kind, eating is a matter of gratifying a mental taste along with the physical. I was born so. When my mental taste is too little pleased, even the urge of hunger will not tempt me to bite the apple.

A most striking phenomenon of the last century has been the growth of nationalism. It has been accompanied by a great strengthening of racial feeling. While this has tended toward the isolation of peoples in their national interests, there has been a development of intercommunication so remarkable as to attract the attention of every one at all alive to what has been going on in the modern world. We have consequently been so pushed against one another that our racial and national feelings have suffered outrage. Some adjustment has become necessary, but for us to attempt that adjustment on the basis of intelligence alone is absurd.

In the narrower world of our immediate social relationships we establish group fellowships in recognition of some agreement in taste, in manners, in personal tendencies and inclinations. The comfort of the individual members of a national whole may not be so much dependent upon a certain homogeneity in the mass as it is in the case of a social gathering. The difference, however, is chiefly one of degree. A nation divided against itself may not be in so bad a way as a house so divided, but it is not in a hopeful condition. In states as in houses division comes from conflicting desires, conflicting personal and group tendencies, conflicting aspirations born of diverse inheritances out of the family, the tribal, the race history. We surrender those desires and submit to the dominance of the desires of others only when the social order of which we are a part subjects us to its more powerful collective will. We are not persuaded out of them through considerations addressed to our pure intelligence. We may be convinced against our will without submitting to any change in the real drive of our natures, without giving up our inner purposes or subjecting our motives to the determination of an outer reason. While we are doing that we who of necessity permit ourselves to be suppressed and those who suppress us may yield to the psychologist's examination the same intelligence quotient.

Modern Culture

IT IS not unreasonable to expect that the psychologists will go on from quantitative to qualitative tests. They are indeed already on that road and something has been done, but it is not enough to furnish a basis for racial or other group classification. We shall have to seek further if we are to discover who are of our kind and who are not.

At the present moment material available for the qualitative evaluation of different races seems to be most abundant in the field of comparative literature. We are accustomed to judge the past, its civilizations and the peoples who produced them, by the written records of what their productive minds have thought about life. We know that we may make mistakes in so doing because much of what they did has in all probability disappeared. That objection does not hold with relation to the work of contemporary peoples. We may know the Spaniard somewhat intimately from the revelation of himself that he is today putting into print. We may know something of the Scandinavian, if we have read Ibsen and Björnson, Bojer and Strindberg. Certainly Dumas and Balzac, Loti and Anatole France will give us some understanding of the French. When we have read Tolstoi and Turgenieff, Dostoyevsky and Chekhov we can judge measurably whether the Russian will contribute to the homogeneity of American life or not. If we know something of D'Annunzio and Fogazzaro, we can more or less know whether the Italian, if given the privilege of affecting materially our mode of life and our social order, will do so in ways contributory to the comfort and happiness of those already established in that order.

We live in a man-made world. It was and is not so with the savage. He takes the world that nature gives him. Through untold thousands of years we have been transforming the crude material of existence with which our early human ancestors made themselves more or less content. There are those who feel that it is the part of wisdom to accept any contribution to our common life that any one may make. The idea is alluring, but it is less sensible than would be the suggestion to a cook getting an apple pie ready for the oven that, since grapes are a desirable fruit, as are also peaches and gooseberries, she add indiscriminately to the filling such portions of each as she may have at hand. The making of a world in which to live, a world offering possibilities of happiness suited to our own individual needs, is a matter somewhat more serious than the making of any kind of pie whatever. The *laissez faire* method of attaining constructive results is no more futile in the kitchen than in society at large. It is no more advisable to bake pie in adaptation to the tastes of those who are to eat it than it is to shape a social order in agreement with the tastes of those who have made the world where it exists their home.

Briefly, it is important and indeed very important that the psychologists shall as promptly as possible tell us how races differ among themselves, not in intelligence so much, as in *tastes, likings, inclinations, tendencies, character, personality.* Then we shall have a basis on which to establish lines of separation. If we are then foolish enough not to establish such lines, we can blame only ourselves for plunging into chaos.

Mr. Ford's Page

AFTER the rather extended discussion which has been given the subject it should now be fairly clear to readers of this page that to confuse the idea of big business with the idea of a money power or with the idea of any actual control of the people's economic sources is to confuse things that fundamentally differ.

And yet it is true that Big Business exists. It is not the Money Power; it is not International Finance; it is not under control of banks which are mere speculative brokers. It exists in its own right, by its own merit, by virtue of its service being recognized by a vast public whom no power can compel to buy or use. Big Business exists, but it exists by the suffrage of the people who are able to value a dollar's worth of service against a dollar's worth of expenditure.

It is, of course, a question how far the bigness of business is economically justifiable. The question cannot be answered as yet, except to say that there are signs in some avenues of useful endeavor that bigness, and centralization, have their limit. The meat business may be taken as an example. It can hardly be said that the difficulties of that line of business—that is, the great national and centralized operations of it—are due to poor management. But there comes a time when even the best management is face to face with an economic fact and is not able, probably never will be able, to climb over it.

BUSINESS grows big through the service it renders, not through any "control" that it exercises over materials, money or people. It grows through the growth of transportation and manufacture. Once every town's shoes were made in that town; manufacturing was done where the immediate market was. With railways, manufacturing became centralized. Insofar as this is economically wrong, wasteful or too costly, it will correct itself. In some lines it is already correcting itself. When business becomes so big that its bigness is a tax upon the community, instead of a service to the community, the decreasing patronage of the people becomes an effective check. In some lines we are slowly treading the way back to community self-sustenance. In doing so we abolish unnecessary processes, and lift an enormous unnecessary load off our railroads.

To ship a hog from Oklahoma as hog, and ship it back five hundred or a thousand miles in its various forms of prepared food, and all for the sake of vast centralization, is such a wasteful act to begin with that no amount of good management can overcome it. And even if it be shipped, say, to New York or Boston where possibly larger prices may be gained for it, the ultimate economic waste and loss is not decreased. It is not *money*, in the last analysis, that keeps a business on its feet, but the *service* it renders. And it may be that the better price brought in New York for, say, bacon, is finally a factor in the ruinous process.

With grain the same principle holds. Why ship wheat five hundred miles and ship it back again five hundred miles as flour? Some may answer that it pays the locomotive and car builders, the coal operators, the almost innumerable kinds of employes engaged in the various elements of the process, that it builds great mills and supports almost unbelievable advertising accounts, while it contributes to the encouragement of many more or less useful industries. Admit all this, what does it do to the masses of the people on whom it constitutes a cost? In the past the country has had wide margins to work upon, but unless unexpected resources are developed these margins may be steadily narrowed. It is not wise, however, to sound a note of alarm as if we were always to continue along the road we now know; it is always possible that something may occur which may make our present "problems" the baseless fabric of a dream. To continue on the lines of the old era was to enter a blind alley. There has been a turning, however, and the New Era already holds the threshold.

But being within the present system it is worth our while to understand it and not develop false fears out of it. The power of money has always tended in dangerous directions, but Business has no power at all unless it tends in serviceable directions. It cannot be denied that Business (as distinct from Finance) has greatly served our people. Of course, when making such a statement it is always necessary to have in mind the fact that there could have been no Business, in the modern sense, had not our people recognized and approved its service.

Take the case of the farmers of Sudbury, Massachusetts, less than two hundred years ago. There is record of their meeting to approve the measures taken by the "merchants and other inhabitants of the town of Boston in order to reduce the exorbitant prices of the necessaries of life." Coffee was then counted reasonably priced at $20 a pound; men's shoes at $20 a pair (women's shoes are not mentioned, as perhaps being unnecessary); cotton cloth came high, and a bushel of salt cost a small fortune.

What accounts for the change in the price of those articles then and now? Business—which is the organization of supply.

Business began small and grew large. There is nothing mysterious about that. When transportation was difficult, and the community needed sap buckets, or hoes, it was easier to get them on the spot. They were not always the best buckets but they were the most easily procurable. That represents one of the big elements of business, having the commodity on the spot near the person who needs it. In earlier times the market spot was necessarily the manufacturing spot. Most of the stuff was made in the town. All the trades grew up around the post office. The blacksmith made most of the farming implements. The weaver made most of the textiles that the kitchen industries did not cover. A town was pretty near being a self-supporting community. No one thought of getting their favorite brand of laundry soap at a distance of hundreds and in some instances thousands of miles as people now do.

It did not follow, however, that all this service was the best or the cheapest. Any country grocer will tell you that "farm butter" doesn't mean anything, until you know what kind of buttermaker the farmer's wife is. The best butter and the worst come from homemade processes. The modern dairy perhaps approximates a good average of quality, certainly a higher average than the old "taken in exchange for groceries" was. And so it was natural that as the country expanded, as means of exchange between communities became more workable, and especially as transportation developed, the better type of suppliers obtained an increasingly wide range of territory to supply.

In this way many of the earliest of the biggest businesses grew up in the East, for there was the bulk of the increasing population. When Industry came into the field it grew to its greatest proportions in those parts of the country that supplied its basic materials, ore and fuel. As the great food supply concerns arose they took their stand in a part of the country between the food-producing and the food-consuming sections of the population. That is to say, these big serviceable organizations all came into existence on a perfectly natural and logical plan. The people made them. One or more men may have developed the idea, but it was the support of the people that gave the idea its big place in the life of the world.

All these things have come about in the course of time, and during their growth and service we have heard a great deal about the danger of Big Business. It used to be Standard Oil. Then it was the packers. Again it was the woolen makers. Wherever the leaders of these businesses have failed to put service first in their program, they have deserved all the opposition they received. Some of these businesses were built by men who had *a vision of the commodity*, but lacked *a vision of the people*. These men played their part. It was a big part, but it might have been bigger if their vision had been bigger.

Some lines of business tend to become too centralized. We are probably learning now that there is a limit to this. The limit, however, does not come by reason of such centralization being a menace to the people's liberty, but by becoming a menace to service. It is perhaps a bad thing to have food or fuel or any daily needful thing centralized. Communities ought to begin to get back as far as possible to the idea of self-support. There is no reason at all why wheat grown at home should not be ground at home, where much of it is to be used.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

HENRY FORD, President.
E. G. LIEBOLD, Vice-President and Treasurer.
C. B. LONGLEY, Secretary.
W. J. CAMERON, Editor.

Twenty-fourth Year, Number 47, September 13, 1924.

The subscription price in the United States, its dependencies, Cuba, Mexico and Canada is $1.50 a year; foreign countries, subscription rates on request. Single Copy, Ten Cents.

Entered as Second-Class Matter at the Post Office at Dearborn, Michigan, under the Act of March 3, 1879. Additional entry at Chicago, Illinois.

Address all communications to The Dearborn Publishing Company, Dearborn, Michigan.

CHANGE OF ADDRESS

To receive your copy without interruption, please observe the following:

1. Notify us at least two weeks in advance.
2. Give both old and new address.
3. Write clearly.

The President Hits Hard

IT IS most refreshing, in the present welter of alienism and foreignism, to hear a President of the United States talk American.

"We do not need to import any foreign economic ideas or any foreign government," says the President.

Yet we have them both, and the people do not know whence they come or what their purpose is. Our alien population has come to these shores thinking that the American system is like the systems they left behind—something to be fought, crippled and destroyed. Moscow has crystalized the idea by preaching that "the capitalistic system" is the same the world over. If it is, why is it that the British workingman is, as the President says, "easily the aristocrat of Europe," while the American workingman is the aristocrat of the world? Why is it that in the two nations least touched with alienism in economic and political ideas, the common prosperity runs highest? What was German prosperity under Prussianism, but a kind of slavery? What is economic life under Moscow but an endless horror?

It is the idea underneath Prussia and Moscow that is being transplanted in America as a new and improved thing.

Here and there challenges have been made to this trend. Brave voices have been lifted in defense of the essential America. Alienism in all its harmful forms has been exposed. But with alienism strongly entrenched within the Capitol itself, whence it issues at regular periods for new assaults upon the Constitution of the United States, it was always a difficult task to teach the people how to distinguish between the vitality of true progress and the ferment of degeneration. By adding his voice to the voices of the watchmen on the walls, President Coolidge has rendered a great and much-needed service. It is earnestly hoped that upon proper occasion he will amplify his remarks until the people of this country fully understand just what he means.

When he does this, the nation will echo his common-sense counsel:

"We had better stick to the American brand of government, the American brand of equality, and the American brand of wages. *America had better stay American.*"

The Abrams Verdict

IN FEBRUARY, 1923, THE DEARBORN INDEPENDENT took up the study and exposure of the Abrams Electronic Reactions, the articles continuing until June of the same year.

In October, 1923, the *Scientific American* turned to the same study, and in the September, 1924, issue of that admirable publication, the verdict is announced.

THE DEARBORN INDEPENDENT'S contention is sustained at every point, and one of the greatest medical fakes of the age is at last finally judged.

A curious experience common to both publications was the flood of letters which came from people who claimed they had been cured by the clumsy Abrams fake-boxes, and from others who charged that the whole matter was a discharge of jealousy on the part of the medical associations, and from others who hysterically begged us not to deprive humanity of so great a boon as Dr. Abrams had conferred upon it.

Needless to say, no medical association had anything to do with what THE DEARBORN INDEPENDENT undertook and accomplished. Our opinion is that the medical profession itself did not have the slightest conception of the spread of the Abrams fake, and little if any knowledge of the facts behind the system itself, until the articles in this paper began to appear.

And as for the pathetic fear that humanity would have been in some way deprived of a great boon, it is needless to say that had our investigations proved the Abrams system to be such, we should have considered it our duty to herald the good news far and wide. However, as matters stand, the poor sick people of the world are more to be warned against medical robbers than informed of medical miracles.

And yet many said they were cured. These fall into two classes. The commonest diagnoses made by the Abrams method were two: cancer and syphilis. As the vast majority of the patients did not have and never had these diseases, it was perfectly easy to scare them to death and then make them endlessly grateful by announcing that at last the disease had been cured by the wondrous Abrams box. The other class claiming cures must be accounted for by the psychical effect of the box and its wires, accompanied by the hope-stirring talk of the operator. As in religion, so in medicine, ritual goes a long way. Many people feel better as soon as they see the doctor, without ever receiving medicine, just as many a toothache eases up the moment the sufferer enters the dentist's office. There are doubtless people for whom as much can be done through the psychical effect of impressive paraphernalia, as by scientific treatment. In any case, a contrivance that was no more potent than an empty cracker box was held by many people to have cured them, and the signatures on some of these letters would occasion more than mild surprise.

As the practice of medicine grows farther away from mere drug-giving, when the suggestion of "health in a bottle" grows less and less, when the physician rather than write a prescription begins to talk about diet and exercise and certain corrective ways of life, the question arises whether the field for medical fakes will not be enlarged. Large numbers of people want something impressive if not fantastic done for them; even the Latin words on the prescription will induce a sense of mystery and learning; whirring motors and clicking wheels serve to emphasize the importance and gravity of the consultation; the old skeleton which used to stand in the dusky corner of our grandfather's doctor's office, had its effect, no doubt. But with these absent; with a new race of physicians trying to tell us that health is not in a bottle but in our habits, refusing to drug us, or even give us bread pills, will the field of the medical faker increase?

Not if we all continue our efforts to educate the people into the truth that health is the natural state of all, and that it is impaired only by some unnaturalness in us. Air, water, natural exercise, natural sleep, natural food—these are health and medicine in one.

Home

"BE IT ever so humble, there's no place like home." Those simple words of John Howard Payne have stirred the world more profoundly than almost anything else that poets have sung or sages have written, and they are as true today as they were when Payne wrote them, "an exile from home." Whether we hear "Sweet Home" sung to a thronging audience by a diva, or played on a dime mouth organ by a small boy on the street, it touches the same chord.

Whatever may be the sweetness or otherwise prevailing within the home, there is no reason why it should not at least be beautiful outwardly, and it is almost invariably the case that when the home is beautiful outwardly, it is happy and sweet within.

Who has not seen a row of cottages with neatly clipped lawns, and a setting of flowering shrubs, clinging vines, and rambler roses, and near them another cottage, of exactly the same material and design, but a veritable "ugly duckling" of architecture with the ground overgrown with rank weeds, and here and there a starved shrub struggling for life! Who has not formed the conclusion, often correct, that within that home things are as desolate as they outwardly appear!

Just as the human face with its smile or its frown is a reflex of the soul within, so also is the environment of the home an indication of the spirit by which it is controlled.

To make home pleasant for those nurtured beneath its roof-tree is a duty which if faithfully fulfilled would keep many from flying away from the old nest. Sordid and unbeautiful surroundings have a deteriorating effect on the mentality of all within; but good thoughts lie on the green carpet of the grass, sweetness is exhaled from the climbing rose, and inspiration springs from the tender but tenacious vine. As a concomitant of all these is the joyous singing of the birds, for they make no distinction between palace or thatched cottage where dwells happiness and contentment.

Selective Education

THE fear is sometimes expressed that the selection of students at the great seats of learning will eventuate in higher education becoming a luxury to be enjoyed only by those who are chosen by university authorities. We hear already of colleges being overfull, of processes which eliminate more students than they pass, of fond fathers registering their new-born heirs for entrance at the traditional schools twenty years ahead.

No doubt, if this condition had existed fifty years ago, some of our best men would have been compelled to forego an education. And if this condition continues, no doubt some of our best men in the next fifty years will be compelled to forego academic training. For no one believes that any process of elimination or selection can possibly meet the situation.

There is, however, no cause for alarm. An aristocracy of education has never existed in any country for any length of time. Life pushes up through it and dwarfs it. All kinds of possible correctives exist for the situation which some fear is coming upon us. One is the Teacher Spirit. None who knows it would suppose for an instant that it could be caged forever in exclusive institutions. The cry of the outcasts, of those forbidden the fountain of learning, would draw that spirit out of the schools and into the woods, and there would be repeated the fact that "a university is a true educator on one end of a log and a student on the other."

That is, the private school would supplant the others. Our greatest schools, as a matter of fact, have always been private schools.

There is no fear of any boy who wants an education being refused one, if he desires it hard enough. The trouble today is that so many boys who do not want an education are forced to go through the motions of getting one. Sometimes a boy's purpose in life involves an academic training; sometimes it does not. Not that the boy is always the best judge of this matter; but in any case the door into learning should be left open for all who want to enter it. Any attempt to close it, to discriminate, to regiment education, would find itself balked. The genius of our people would burst up through it.

An Old Story

IN THE third of a series of articles entitled "When the Negro Comes North," which appears in the *World's Work*, Rollin Lynde Hartt says that "many white aliens live in close contact with Negroes and, never having recognized a color line in Europe, are slow to recognize the color line here." The writer apparently has in mind the polyglot population which is so characteristic of the Near Eastern part of Southern Europe and round about the Mediterranean: "Parthians, and Medes, and Elamites, and the dwellers in Mesopotamia, and in Judea, and Capadocia, in Pontus, and Asia, Phrygia, and Pamphylia, in Egypt, and in the parts of Libya about Cyrene, and strangers of Rome, Jews and proselytes, Cretes and Arabians, we do hear them speak in our tongues . . . ."

It must be understood that today, as in the time of the Apostles, different races, many of them colored, and drawn from a large area, do business in the Levant and in the busy marts of commerce along both the northern and southern shores of the great sea. This commercial relationship of so many different races and existing for so many centuries has undoubtedly had a powerful influence in eliminating the color line in that part of the world. But north of the Balkans, or the Alps, or the Pyrenees, in fact the greater part of Europe, there is practically no color line to recognize.

Dealing further with the attitude of "white aliens" toward the color line the writer says:

"One whole class of aliens, or descendants of aliens, would seem inclined now and then to disregard it. Jewish tradesmen and pawnbrokers follow the migrants northward. A Jewish lawyer organized Marcus Garvey's Black Star Line. The National Association for the Advancement of Colored People has a Jewish publicity agent. It was a Jewish labor union that addressed Negroes as 'our persecuted comrades and brothers,' while many of the radicals who fraternize with Negroes are Jews. Enormous sums have been expended for Negro education by the Chicago merchant and philanthropist, Julius Rosenwald."

In regard to the relationship of the Jewish and colored races it must also be borne in mind that the royal house of Abyssinia, the male head of which has recently been paying a visit to King George of Great Britain, claims to be descended from King Solomon and the Queen of Sheba, and is inordinately proud of the fact.

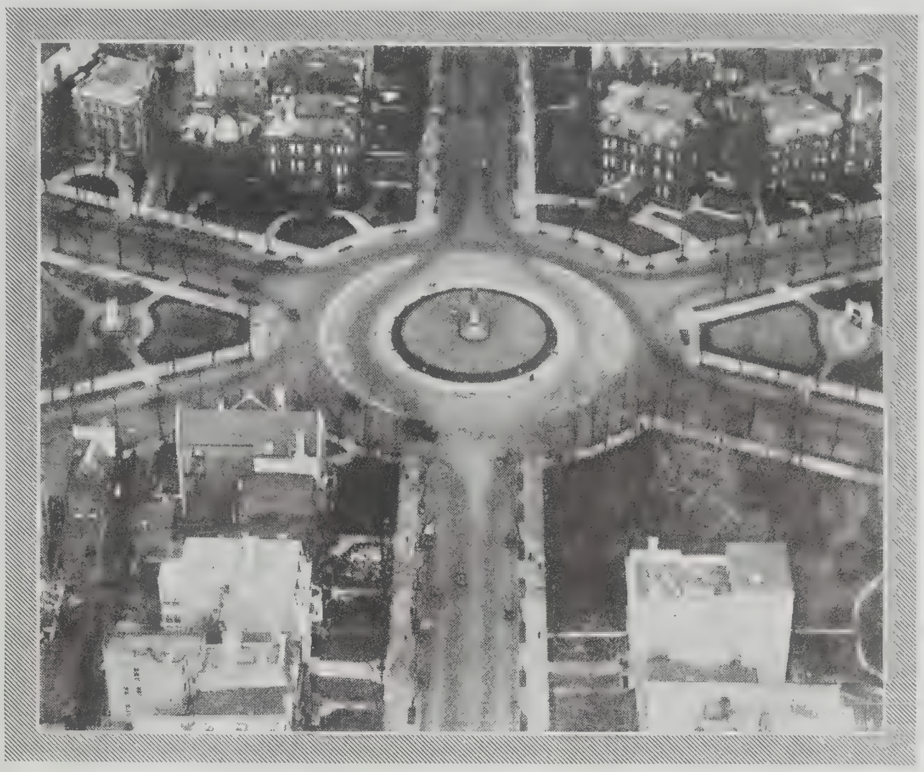
Thus does history keep on repeating itself, with a great many people in the world thinking that it is something new.

The City Beautiful—A Modern Development

How America Has Awakened to Advantages of Uniting Art and Utility

By HUGH C. MITCHELL

TODAY about fifty per cent of the people of America live in cities, yet it is only today that the people are beginning to think of building cities as places in which to live. With a very few notable exceptions, the cities of America started as small nuclei—formed usually by some economic condition—and each small nucleus just grew, like Topsy—yielding now to this force and now to that; stopped by obstructions—forced ahead by natural laws or by man's efforts—until the city of today is like a giant oak grown from a small acorn—its branches' forms influenced by wind and rain, cut by sleet, damaged by disease—one side often flourishing and beautiful to behold, but another side exposing only scarred limbs and lopped branches.



A park-like center from which six streets radiate, forming a feature which is striking in its simplicity and as beautiful as it is utilitarian.

But today all this is being changed; today the cities of America, literally hundreds of them, are taking stock of themselves, and *city planning*, a fad of yesterday, a cult for the esthetic, is today become a science, a great human science, utilizing many branches of applied science to serve its needs, and developing a technic of its own so rapidly that one man or woman can scarcely keep informed of its progress. Perhaps Theodora Kimball, librarian of the Harvard School of Landscape Architecture and honorary librarian of the American City Planning Institute, has done more—is doing more—to keep the technical world informed of the strides being made in this new-old science than is any one else. For this is both a *new* and an *old* science. The walled city of Jericho was certainly planned in part to resist its enemies, and just as the horns of its enemies set at naught the old plan of that walled city, so today the insistent "a-a-o-o-y-a-h" of the automobile horn is taking its place as a big influence in city planning.

But what is city planning? Many definitions can be found, any of which may remind one of the blind men and the elephant. I think it was in a third reader of long ago that we read of the blind men who were curious to know what an elephant might be like, and approaching one, each took hold of the beast; one touched his leg and exclaimed that the elephant was mighty like a tree; another swinging on to his trunk found the elephant like a rope, and so on. So it is in city planning; the definition given usually depends on the point of approach. But underneath the many definitions will be found a common ground, a universal purpose—the basis of all definitions, which may be simply expressed: "City Planning is making the city a better place in which to live." The landscape architect wants it more beautiful; the sanitary engineer more healthful; the economist more convenient; the sociologist more humane. City planning is making the city a better place in which to live—better for us morally; better for us physically; better for us intellectually.

Undoubtedly one of the greatest single problems which today confronts the city planner is congestion—compelling too many persons to live in rigidly bounded districts. Why do they do so? How can they be helped? Economic forces are their masters; social conditions are their guardians. Long hours required of poorly paid laborers demand that they either live near their work or else seek cheap homes so remote that the cost of transportation and the time lost more than offset the gain in rent. So, to live near his work the laborer must live on high-priced land and therefore have much less of it. How can the city planner help him? The answer is being sought by the engineer, the sociologist, the economist—in a word by the city planner, who may be an individual, but is more apt to be a group of individuals, each bringing expert service from a varied field to bear on the problem. One remedy suggested is the satellite city, taking from the congested district of the city those industries which will do as well or perhaps even better in smaller cities designed especially to accommodate them, close enough to the metropolitan center for all practical purposes as of transportation and trade, yet sufficiently remote therefrom to give its people the benefits of more land and open spaces. Sometimes the solution lies in more direct and economical transportation, permitting the worker to live on cheap land in the suburbs and yet ride to and from his work in the city.

Or take the case of the more prosperous citizen, driving his automobile to and from his office. Today this presents an important phase of possibly the greatest problem in city planning—the overcrowding of our streets. Overcrowding them with moving cars—overcrowding them with stored cars! For the parked car is a stored car, and the block which is filled with parked cars is but a warehouse while so used. And the answer? The city planner is seeking it with all the tools of his trade. It is a live and fast-growing question, and he must travel fast else it will elude him. He must provide more direct and easier routes of travel where needed, and limit the storing of cars to regions where most room is available. The day is not far distant when special provisions for parking in downtown districts will be made; possibly space will be provided in the interior of blocks, in sub-surface structures under parks and parking, and undoubtedly in basements of large buildings for the use of the tenants thereof. The city planner must make it easier and easier for automobiles to move along certain routes, harder and harder for them to stop. By widening a street he gives it greater capacity; by eliminating a left-hand turn he removes an obstacle. He makes streets in the congested district one-way streets, alternating the direction of travel on successive streets. He limits the period for parking on some streets, sometimes prohibiting it entirely between certain hours.

These things cannot be done in arbitrary fashion. Unless he makes a careful study of the area concerned, learns the habits of the persons using it, he cannot know where to apply his remedy. He may clap his mustard plaster on the wrong member, on a perfectly healthy part, leaving the diseased member to grow worse and worse. Or perhaps no mustard plaster is needed, but rather the knife of the surgeon, enlarging a much congested artery, or opening up an entirely new one.

If he be planning a new city, the planner must foresee such needs and so plan his streets that they may grow with the city. By providing the full width for the ultimate use of a street, he may arrange for a progressive system of paving to care for the growing needs of traffic, the unused portion of the street being left in parking until needed. He knows that *through traffic* will usually follow the lines of least resistance, and so in planning new cities provision must be made for such traffic by direct routes of easy grades. To do this intelligently the city planner must make a survey of the *through traffic*, must know its character and its amount. This will enable him to determine the width of roadway required, and the character of the pavement to be used.

In many ways it is desirable that a residence street not invite *through traffic* with its attendant noise and dust, and hazards to small children. For such streets the city planner may use steeper grades and curves, and sometimes with advantage such forms of streets as are called *places*, and *crescents*, and *cul-de-sacs*. He may achieve a certain isolation, but he must not do so through remoteness, for the dweller in such places must suffer no inconvenience in getting from his home to the thoroughfare or traction line which will take him to his place of employment. And the efficiency of the modern fire-fighting apparatus must not be reduced one whit by curves too sharp, streets too narrow, or places too inaccessible.

The time is not far past when the street was regarded by many as the legitimate playground for children. It has not been many years since a prominent member of the House of Representatives, objecting to an appropriation for playgrounds, defended the use of the street as a playground by his children—by all children. But the extreme hazard of such use of the street to those so using it has convinced the most skeptical that the street is no longer claimed as a legitimate play place for children, except in the logical cases in proximity to schools where police orders may close a block of traffic during the recess periods without working undue hardships.

But the street is surely something more than a thoroughfare; something more than a thing to be passed through, as one put it, "like sickness and trouble." The man who takes thirty minutes to go to his work in the morning, and the same time in the evening returning home, spends 300 hours—twelve and one-half days—a year in the street. Should not the street then be pleasant to be in, as well as comfortable to travel through? A few years ago an esthetic purpose in city planning was not recognized as a public use under the Constitution, and authorities desiring the elimination of such features as ugly billboards had to have recourse to the police power, and control such things as unsanitary, or as nuisances. Now an interpretation of the Constitution which is gaining ground is that in many cases the satisfaction of the esthetic sense is a public use, and when this principle shall have become well established, as it is hoped it will be ere long, the city planner will have another and much-needed tool with which to work.

The recognition that the street is not a proper place for children at once imposes on a city the necessity for providing proper play places, and this the cities are doing, often at a great cost, as where no reservations for parks are held in the built-up portion of the city, and suitable ground can be acquired only at a high cost. But even at a very high cost the playgrounds are worth it.

In the regional survey of New York City and its environs, now in progress, a survey covering some 5,533 square miles of territory, the main topics being considered, the major surveys being undertaken, are the physical survey, the economic and industrial survey, social and living conditions survey, and legal survey. These surveys are being made by way of securing adequate data on which to base comprehensive planning recommendations. These are in no way independent fields, nor just overlapping fields, but rather superimposed, and to some extent successive fields of endeavor.

Loading and unloading at the curb, thus reducing a 60-foot roadway by at least 25 per cent. Cars parked parallel to opposite curb make a further reduction of seven or eight feet, while the platform along the car tracks almost makes necessary a "No Thoroughfare" sign for this section of a main street.

One of the large department stores of Washington, D. C., has its loading platform *under* a corner of its building, thus removing from the street one of the greatest traffic obstacles, trucks being loaded and unloaded at the curb. Contrast this picture with that of a neighboring store where loading is done at the curb.

More Destructive Than the Boll Weevil

Sapiro Plan Causes Loss of $10,000,000 in Cotton Crop in Three Years

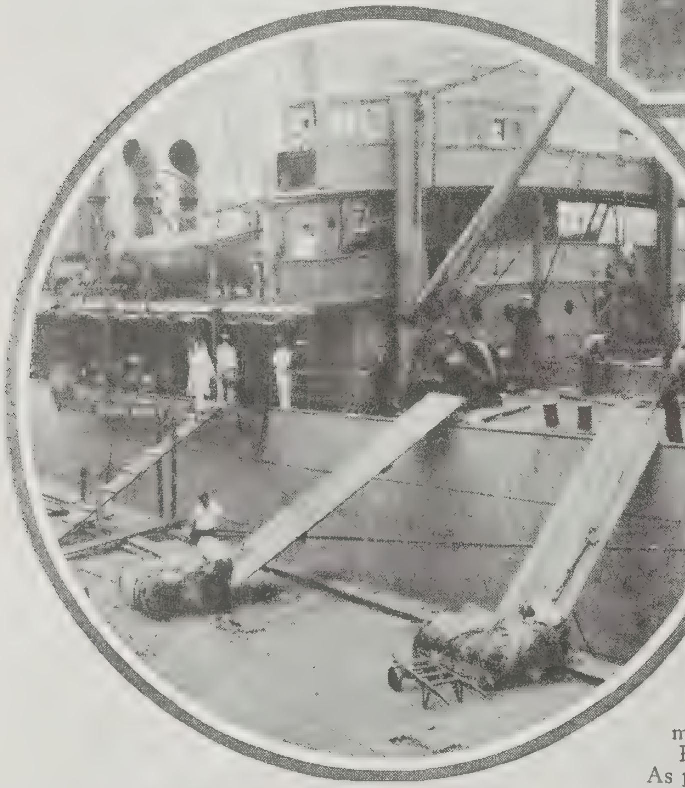
By ROBERT MORGAN

UP TO three years ago, the greatest and most destructive enemy of the cotton crop in the United States was the boll weevil. But within the years of 1921, 1922 and 1923, there developed in the cotton industry another destructive agency which has cost the cotton planters of the sections in which it has been allowed to develop a loss which is comparable to that caused by the boll weevil. This agency is the Sapiro Plan of co-operative marketing applied to cotton.

There are several of these organizations in the great cotton belt. There are other co-operative cotton associations, not based on the Sapiro Plan, which have had a reasonable amount of success.

Not one of the associations organized on the Sapiro Plan has been successful; not one today is not in the throes of internal strife, with its members trying to escape from the costly contracts they signed when the co-operative bodies were formed; and not one can show that, in any year, it sold its cotton to such advantage, or paid its members so well for their crops as other growers outside these associations were paid.

A clear-cut example of this condition is the Staple Cotton Co-operative Association, with headquarters at Greenwood, Mississippi. It operates largely among the long-staple cotton producers of the Yazoo River Delta. For the past three years it has handled an average of between 135,000 and 140,000 bales of cotton. Its scheme—the same as that of all the other Sapiro Plan co-operatives—of "orderly marketing" and price-fixing has failed so completely that the members of this association, about 1,600 in number, have received for their crops of 1921, 1922 and 1923, more than $10,000,000 less than the independent growers of the same amount of cotton of the same grade received for their cotton. That is to say, the cotton growers inside the association actually lost this huge sum, because, if it had not been for their membership in the association, and the contracts which they were compelled to keep, they would have sold to independent buyers at a price, for the three-years crops, totaling more than ten million dollars above what they received through the association.



Loading cotton on board ship for Europe, at the New Orleans cotton compress and warehouse. The Sapiro Plan ultimately would take control of all cotton out of the hands of the producers and put it under the direction of the Jewish organization now exploiting the American farmer.

Losses actually sustained ranged from $20 a bale to $60 a bale. A bale of cotton weighs 500 pounds, and this loss indicates a range of prices at which cotton was sold by this co-operative association of from four to twelve cents a pound less than the independents were paid. More growers lost $20 a bale than lost $60; more lost $20 than lost $40; about the same number lost $30 as lost $20. A conservative average of the loss a bale is $25. This loss probably was in reality closer to $30, but the men who lost this money through the association, and with a number of whom I have talked, are willing to accept $25 a bale as the average.

Giving the association the benefit of the lowest figures, and saying that it handled 135,000 bales a year for the three years—though it claims to have handled 140,000 bales—makes a total of 405,000 bales for the three years. The average loss on this cotton was $25 a bale, and the total loss was $10,125,000.

This is a minimum figure, and there are a number of cotton planters in the Yazoo River Delta who estimate it at more than $12,000,000 for the three years.

The reasons for this loss are the same fundamental economic faults which have appeared in all the Sapiro Plan co-operative marketing associations:

First—Extravagance and waste in operating costs.

Second—Impossibility of price-fixing.

Third—Complete failure of the "orderly marketing" scheme.

Fourth—Incompetent management.

As previous articles in this series have shown, the greatest loss to the agriculturist member of the Sapiro Plan co-operative association has been directly from the first of these causes, but the fundamental reasons which prevent successful operation of the Sapiro Plan in any crop are the second and third.

The first and fourth conditions can be remedied, if the farmers take hold of their own associations and operate them on an American business basis instead of on a Jewish "get-the-money" system.

But the second and third conditions cannot be remedied; they are parts of the inexorable economic law of merchandising, and when they meet the simple law of supply and demand, the Sapiro Plan comes crashing about the ears and through the pocketbooks of the farmers who are in the association.

It is the fault of the agriculturist if he does not take control of his own association, oust the incompetents and the wasters, and put in men who will do the work in the interests of the farmer. But the farmer cannot controvert the economic errors of "orderly marketing" and price-fixing which the Jewish exploiters of the American agricultural industry, and the Gentile fronts for these Jews, have fastened like a millstone around the neck of each one of these co-operative marketing associations.

"Orderly marketing" comprehends the division of each year's crop, in this case cotton, into twelve equal parts, one part to be sold each month, regardless of supply and demand or of price offered by independent buyers. Since, at some seasons of the year, the demand for cotton is much greater, and the price, accordingly, much higher, the co-operative loses the benefit of the high-price period, except on one-twelfth, or, sometimes, two or three twelfths, of his crop. Further than this, he is compelled at low-price periods to accept the low price, while he never reaches the high price the outside market offers the independent grower, except for a small fraction of his crop.

Saturday afternoon in the middle of the cotton season in Mississippi. The town of Winona, where many owners of cotton plantations in the delta of the Yazoo River live. In the past three years, these delta planters have lost more than $10,000,000 on their cotton crop through membership in a Sapiro Plan co-operative marketing association.

Price-fixing, as promulgated in the Sapiro Plan, consists in the establishment of a price for each month's part of the annual crop as sold under the orderly marketing plan, such price being made regardless of prices in the world markets, demand of consumers, or other conditions.. Quite naturally, manufacturers will not buy cotton when the so-called fixed price is too high, and there has never been a single Sapiro Plan co-operative marketing association which has been able to maintain the prices it fixed, except in the period of peak of demand for the commodity handled. The supply-and-demand factor is too strong even for the inventor and promulgators of the Sapiro Plan.

Results in the business world, however, are of more value than theories or arguments. Let us look for a moment at the record of the Staple Cotton Co-operative Association, of Greenwood, Mississippi, selected from the other Sapiro Plan cotton co-operatives because Mr. Sapiro's publicity brigade constantly holds up this particular association as a model of success in the cotton belt.

The Staple Cotton Co-operative Association was organized in 1920 by Aaron Sapiro, who was brought into the field by O. F. Bledsoe, Jr., present president of the association. Mr. Bledsoe is paid a salary, and has the direction of placing the insurance on cotton worth rather more than $20,000,000 a year. Mr. Bledsoe has a plantation of something like 40,000 acres of land in the delta, this delta being the territory covered by this particular association, which handles only the long-staple, high-grade cotton grown there.

The five-year contracts with the planters, written on

Sampling cotton for grading. Grades made by the "cotton experts" in the Sapiro Plan Co-operative Cotton Associations are uniformly lower than those given by the New Orleans Cotton Exchange, which is the recognized authority on cotton throughout the world. These lower gradings by the association result in lower prices to the members of the association than are received by independent growers.

the 1921 crop, were based on a minimum control by the association of 200,000 bales, but only a little more than 100,000 bales was signed up in the crop for that year, so notice was sent to all those who had signed up, that the 200,000-bale condition in the contracts would be reduced to 100,000 bales. This notice also contained the information that those members who failed to reply to this notice, announcing their withdrawal from the association because of it, would be considered as supporting the reduction. Without this reduction in bales to be signed up, the association would have disintegrated and the promoters of the organization would have been unhorsed. The majority of the members of the association who failed to read the second clause in the notice, or who did not reply to it, found themselves bound to an association which, to hold them to their contracts, had to handle only 100,000 bales of cotton a year.

This is merely one of several clever turns worked on the farmers of this country who have joined the Sapiro Plan co-operative associations, and now the farmers of the Yazoo River Delta have to endure, in addition to 1924, another year of loss on their cotton because they have to market it through the association, their contracts expiring at the end of 1925. In 1919, cotton from this delta sold for seventy-two cents to one dollar a pound; in 1920, due to the economic laws which the Sapiro Plan is endeavoring to overthrow, it fell to forty cents, on a crop which cost at least forty cents a pound to produce. One planter spent $75,000 in actual cash to produce a crop which he ultimately sold for $35,000. Mules which had sold for $1,000 a pair, fell to $150 a pair.

On this depressed condition, Aaron Sapiro appeared as the "savior" of the cotton planters of the Yazoo Delta.

Let us see how he has saved them:

As has been his custom, Mr. Sapiro first obtained the passage of an act through the Mississippi Legislature, enabling co-operative marketing associations built on the Sapiro Plan to function in that state. The directors of the association, all prominent planters of the Delta, elected the man who brought Sapiro into the Delta as president. This was and is O. F. Bledsoe, Jr. Then W. M. Garrard was made general manager, a position he still holds, at $40,000 a year salary, with twenty-five cents a bale commission on all bales sold above 200,000.

The utmost secrecy surrounds the operations of this association, but the actual cost of marketing a bale of cotton through it has been *between $5.90 and $6*. The cost to a grower, outside the association, for the same service *is around $2.50; never more than $3*. This is where part of the loss to the cotton growers goes, but it is only a fraction of the $20 to $60 a bale losses which they have sustained.

The Staple Cotton Co-operative Association, by its own statement, handled 157,000 bales of the 1921 crop. The average price received by the association members—bear in mind that this is not by the *association*, but by the *members*—was 24.84 cents a pound. The average price received by growers, outside the association, was 29.46 cents, while many sold their entire crop for as high as 31.40 cents. Taking the minimum figures—all of which are net to the farmer, after all expenses had been deducted—we find a difference in favor of the independent grower of cotton, and against "orderly marketing" and "price-fixing," of 4.62 cents a pound, or $23.10 for a 500-pound bale.

The 1922 crop—168,000 bales of it—was sold by the association at an average price of 27.09 cents a pound, or $135.45 a bale, less $5.90 costs of the association, or a net to the farmer of $129.55. The grower, outside the association, sold his cotton in 1922 for an average price of thirty-one cents a pound, or $155 a bale, less one per cent, or $1.55 costs of marketing, leaving him a net of $153.45 a bale, or $23.90 more than the man in the Sapiro Plan co-operative marketing association received.

But these are merely averages. Three men living near Greenwood, and owning large plantations in the Delta, showed me their books, in which appeared clear and unrecoverable losses of from nine to twelve cents a pound, that is, from $45 to $60 a bale on their cotton. These losses were caused by the association "experts" grading this cotton lower than it should have been graded, thereby getting lower prices for it than the cotton actually was worth; and by the association's having held the cotton beyond the peak-price periods, through the monthly allotment system of the "orderly marketing" plan.

But it was the 1923 crop on which the fine work of the Sapiro Plan appeared in all its effectiveness. In 1923, the Staple Cotton Co-operative Association marketed 170,000 bales. The total production in the Yazoo River Delta was around 500,000 bales. Growers who were not signed up to the Sapiro Plan received net, for their cotton, from twenty-eight to forty cents a pound for the 1923 crop, an average of thirty-four cents, or $170 a bale. The association received an average of thirty-two cents, gross, for its cotton, or $160 a bale, less $5.90 costs of selling, or a net to the farmer of $154.10 a bale—$15.90 a bale less than the average received by non-Sapiro growers. But—and this is important, because it reveals the fault of "orderly marketing"—more than seventy per cent of the cotton sold by the other planters was sold at thirty-eight cents a pound or better, while only one-twelfth of the cotton handled by the association ever reached this price.

During 1923, one cotton grower in the Delta picked 300 bales of cotton, which, though he was a member of the Sapiro Plan association, he sold independently, at thirty-seven and one-half cents a pound. *He paid the association $2,250 penalty for so selling independently, and still made $9,000 net on his crop.*

PUBLIC COTTON WAREHOUSES
OF THE BOARD OF COMMISSIONERS
OF THE PORT OF NEW ORLEANS
THE LARGEST AND BEST IN THE WORLD

High density cotton compress in the huge municipally owned and operated cotton plant at New Orleans. Here baled cotton from the gin is so compressed that about thirty per cent more bales can be packed into the same space in a car or ship. One of the schemes of the Sapiro Plan is to have the farmers buy or build their own cotton compresses, borrowing money for this purpose from Jewish bankers,

One small grower made 122 bales, which he sold through the association at thirty cents a pound, or $150 a bale. He was offered thirty-seven cents a pound by the independent buyers, or $185 a bale, but feared court action by the association, and so continued delivery to the latter, thereby losing $35 a bale, or $4,270 on his crop.

Another grower found, by taking samples of his cotton and having it graded by the New Orleans Cotton Exchange, that he was losing an average of six cents a pound, through faulty grading by the "experts" of the Staple Cotton Co-operative Association. The New Orleans Cotton Exchange is the most widely known and respected authority on cotton in the world; its secretary, Henry G. Hester, is known in every country as the greatest expert on cotton the industry has ever known. The exchange and Mr. Hester are called upon scores of times each year to arbitrate gradings and other arguments in cotton production. Yet when the correct grades were shown, as made by this independent and uninfluenced authority, the Sapiro Plan association replied that it did not recognize the New Orleans Cotton Exchange, or Mr. Hester, but would make its own grades.

Quite naturally, the buyers of cotton are in no way displeased with the grades that the co-operatives make. But the planters are not so well pleased. Late in 1923 and early in 1924, a petition was drawn up and circulated by certain prominent planters in the Delta, asking for the dissolution of this association, and the abrogation of its contracts, which, as has been said, already had cost the planters of this region more than $10,000,000 on their three years of crops under the Sapiro Plan. Before this petition had been presented to the directors of the Staple Cotton Co-operative Association, that board called a meeting of the membership at Greenwood, Mississippi, on June 13, 1924. All the directors, including the president and general manager, were on the rostrum; the audience was filled with scattered groups of the employes of the association, all of whom would lose their jobs if it were dissolved. A petition for the continuance of the association was presented on the platform, by the directors. It was said to contain the names of 1,000 of the 1,600 members. The argument was made that the association had 25,000 bales of the crop still on hand, and that this would be a total loss if the association were disbanded. As a matter of fact, other growers at that moment were selling their cotton for four to six cents a pound more than the association was receiving for the crop of its members, and the 25,000 bales could have been sold in ten minutes for greater net return to the grower than he ever had received.

One of the leading members of the association questioned the petition, asked how the names were obtained and whether the funds of the association were used in forming the petition and getting signatures to it. He inquired how much money of the association funds was used for this purpose, and where the board of directors obtained the authority to use association moneys in this manner. He asked to see the petition and to have the names on it checked, so as to learn how many of the names were those of employes, and how many of cotton producers.

He was refused an answer by the board of directors and howled down by the employes planted through the audience.

This, of course, is merely one instance of the "strong-arm" methods used by these Sapiro Plan co-operatives to keep the association in power. It has been used before, from the prune-growers of California to the tobacco-producers of Kentucky, and will be used as long as the agriculturists of America submit.

Delayed payments for cotton, and the payment of interest on funds borrowed from banks to make what are known as "advances to the members," are also factors in the sad history of the Staple Cotton Co-operative Association. One man who received 29.06 cents a pound for his 1923 crop, or $145.30 a bale, less $5.90 for association expenses, or $139.40 net a bale, received his final payment for his crop at the end of July, 1924, seven months after the cotton had been delivered to the association. He could have sold all his crop, *for cash*, at the end of 1923, at thirty-six cents a pound, or $180 a bale, less one per cent, or $1.80 a bale, costs of marketing, leaving him with $178.20 a bale cash in his pocket, seven months before he finally received $139.40 a bale from the association. This is a difference of $38.80 a bale in price received, not counting the interest this man paid on the "advances" made to him by the association.

It is interesting to note that every member of every Sapiro Plan co-operative marketing association in this country *pays interest on his own money* to the association, that the association may pay him for his own crop.

Jewish banking houses naturally have no objection to this method of doing business, but it does appear a trifle wasteful. The farmer, having handed over control of his crop and, in some instances, of his lands as well, can do nothing until his contracts expire.

The Staple Cotton Co-operative Association issued a statement of distribution of sales and expense to another cotton planter, as follows:

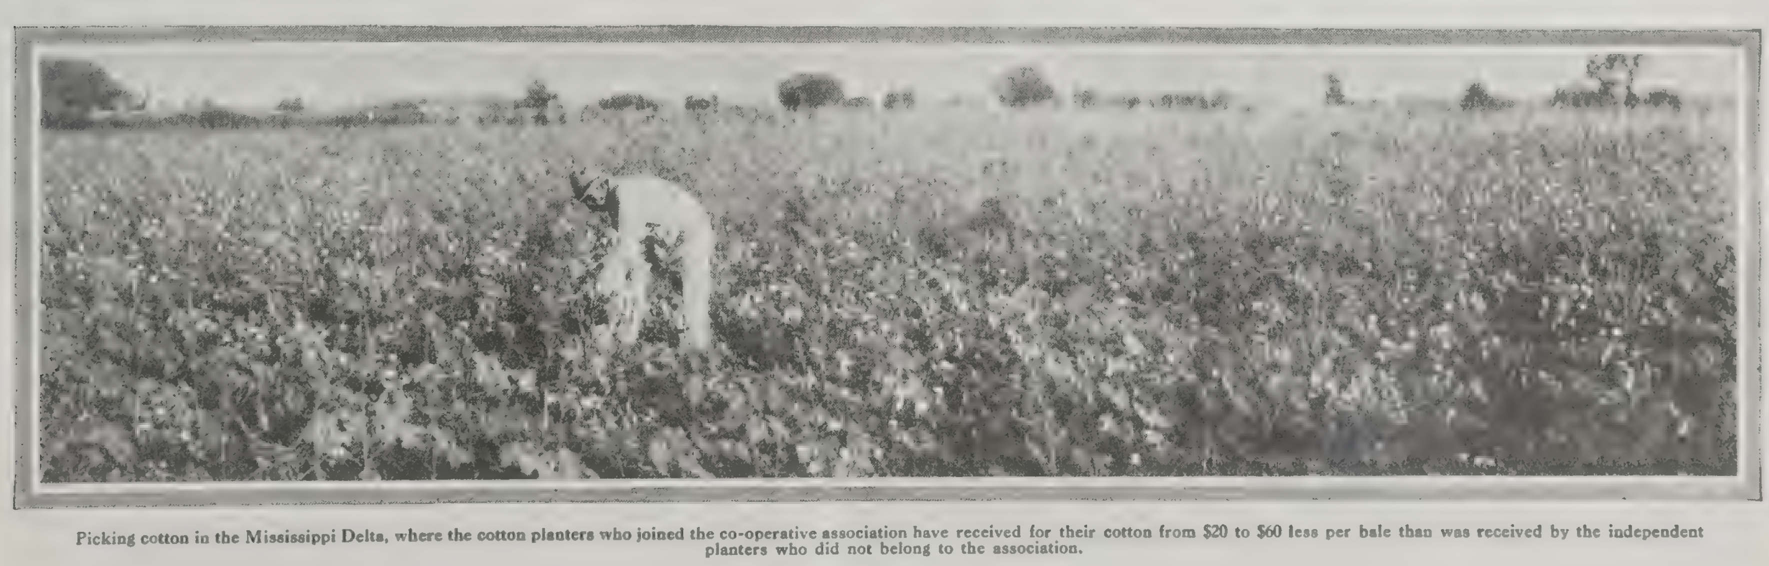
Total cotton sales		$ 41,128.71
Operating fund, 3 %	$ 1,233.86	
Advance, 2%	822.57	
Distribution checks to member	22,652.97	
Total loan	13,972.13	
Interest	287.41	
Miscellaneous charges	27.65	
Check, this distribution	2,132.12	$ 41,128.71

The cost to this cotton grower for the marketing of his cotton through the association was 5.8 per cent of its total value. The cost outside the association was one per cent, or *less than one-fifth of the cost of the Sapiro Plan.*

This ratio holds true for virtually all of the average of 135,000 to 140,000 bales of cotton marketed by this association each year.

There are always side issues to every Sapiro Plan

(Concluded on page 14)



Picking cotton in the Mississippi Delta, where the cotton planters who joined the co-operative association have received for their cotton from $20 to $60 less per bale than was received by the independent planters who did not belong to the association.

Drove Golf Balls Over Cathedral Spire

Some Stirring Tales of Royal and Ancient Game—Mostly Scottish

By ZETA ROTHSCHILD

THE first mention of golf in the history of Scotland, its native land, comes in an act passed to prohibit it. In March, 1457, during the reign of James II of Scotland, a statute was passed by the Scotch Parliament, prohibiting the exercise of golf, because it might take the place of more practical training in archery. These were the days before gunpowder, Big Berthas and other wholesale means of inflicting death on the enemy had been invented and the bow was the principal instrument of war. The Scotch were accomplished bowmen and with the increasing popularity of golf, the king feared a lessening of their skill in archery. Therefore the above-mentioned act.

Evidently both the love of golf on the part of the Scots and the fear of parliament that they love it too much for their country's good, continued to grow. For in both the reign of James the Third and James the Fourth, in the middle and end of the fifteenth century, additional acts were passed to discourage golf. James the Third ordered that golf should be put aside, and that "the buttes be maid up and schutting be used, after the tenour of the Acte of Parliament maid thereupon," while during the reign of his successor a statute was passed to the effect that "in na place of the realme there be usit futte-ballis, golfe, or uther sik unprofitabill sportis, for the common gude of the realme, and defense thereof, and that bowis and schutting be hantit, and bowmarkes maid therefore ordained in ilk parochin, under the pain of fourtie shillinges, to be raised to the schireffe and baillies foresaid."

Kirk Bans Sunday Golf

BUT despite these patriotic edicts and arguments that golf was an unprofitable sport, even the canny Scot refused to put aside his clubs and to desert the green.

These restrictions fell into disuse, however, when gunpowder came into fashion and archery became passé. But new ones were a-budding. Golf was becoming much too popular in the eyes of the kirk, for the lure of the links was keeping many a lover of the game from his Sunday devotions. The dominies, when no attention was paid to their words from the pulpit, rushed to the law for action. Thereupon, in 1592, the Town Council of Edinburgh prohibited the game on Sundays. Two early enthusiasts were prosecuted for "playing the Gowff on the Links of Leith, every Sabbath, the time of the sermonses." In 1604, Robert Robertson and others were convicted of profaning the Lord's Sabbath, by playing at "Gowff" and Robertson was fined while the others had to appear the following Sabbath in the place of public repentance, in the presence of the whole congregation.

Similar prosecutions continued down to the time of James VI, in 1618, who met the golfers halfway in a proclamation "when (says he) with our owne eares wee heard the generall complaint of our people, that they were barred from all lawfull recreation and exercise upon the Sundayes afternoone, after the ending of all Divine service, for when sha the common people have leave to exercise, if not upon the Sundayes and holydayes, seeing they must apply their labour, and winne their living in all working dayes?"

And, continued this righteous King, "after the end of divine service, our good people be not disturbed, letted, or discouraged from any lawfull recreation—such as dauncing, either men or women, archerie for men, leaping, vaulting, or any other such harmless recreation." But prohibited "the said recreations to any that are not present in the church at the service of God before their going to the said recreations."

Goff, for the Scots spelled it as they pronounced it, continued on down through the seventeenth century into the eighteenth until even the historians in England remarked on the popularity of the sport.

Driving Over St. Giles

"HARD by, in the fields called the Links, the citizens of Edinburgh divert themselves at a game called Golf, in which they use a curious kind of bats tipped with horn, and small elastic balls of leather, stuffed with feathers, rather less than tennis-balls, but of a much harder consistence," writes Smollett about 1766. "These they strike with such force and dexterity from one hole to another, that they will fly to an incredible distance. Of this diversion the Scots are so fond, that, when the weather will permit, you may see a multitude of all ranks, from the senator of justice to the lowest tradesman, mingled together, in their shirts, and following the balls with the utmost eagerness."

Strutt, toward the end of the century, has something more to say about the game itself and his description shows there has been little change in the last hundred and fifty years of golf.

"Goff," writes Strutt, "according to the present modification of the game, is performed with a bat; the handle of this instrument is straight, and usually made of ash, about four feet and a half in length; the curvature is affixed to the bottom, faced with horn, and backed with lead; the ball is a little one, but exceedingly hard, being made with leather, and stuffed with feathers. There are generally two players, who have each of them his bat and ball. The game consists in driving the ball into certain holes made in the ground, which he who achieves the soonest, or in the fewest number of strokes, obtains the victory. The Goff lengths, or the spaces between the first and last holes, are sometimes extended to the distance of two or three miles; the number of intervening holes appears to be optional, but the balls must be struck into the holes, and not beyond them; when four persons play, two of them are sometimes partners, and have but one ball which they strike alternately, but every man has his own bandy."

Though royalty occasionally took up golf, its most successful practitioners were the everyday folk. For when His Highness, the Duke of York, was residing at Holyrood Castle, he argued with two Englishmen that the Scots played the better golf. To settle the dispute, a wager was made, and for the consequent match against the Englishmen the Duke chose one John Patersone, a shoemaker, who was considered the best golf player in Edinburgh.

The match was won by the Duke and his partner and the latter received a very great reward for his assistance. The victorious shoemaker built himself a house on the Canongate of Edinburgh, with the proceeds of the wager. On the wall above the door of his house which he christened "Golfers Land," he had an inscription in Latin, which, translated, reads:

"In the year when Patersone won the prize in Golfing, a game peculiar to the Scots, and in which his ancestors had nine times won the same distinction, he raised this mansion to commemorate a victory more noble than all the rest."

And for a crest, this modest man adopted a hand dexter, grasping a club, with the motto, "Far and Sure."

The Scots became so proficient with the ball and club that many a stunt they put over to show off their skill. The St. Andrews' golfers tell of their club member who struck off three balls from one hole to another, a distance of about five hundred yards. With a uniform number of strokes to each ball, the three balls reached the hole so close together that the golfer could touch them all with his club.

They still tell in Edinburgh of the wager made that no two members of the Edinburgh Burgess Golf Club could drive their balls over the spire of St. Giles Cathedral. A Mr. Scales and a Mr. Smellie were chosen to represent the club and a stand was built for the judges level with the weathercock so they might have the best view obtainable of the balls. In case of need, each man might have six balls. The morning was bright and clear, and without any difficulty witnesses saw the balls soar considerably higher than the weathercock on the dome of the cathedral.

A later anecdote tells of two Scots who wagered that they could drive their balls from the golf house on Bruntsfields Links over Arthur's Seat in forty-five strokes. The distance is two miles and the Seat is more than 800 feet high. One man lost with a score of forty-six strokes, while the winner made it in forty-four.

The "Cock o' the Green'

ONE Alex McKellar, in golf history known as the "Cock o' the Green," often practiced "putting" at the "short hole" by lamplight. His golf-hating wife, so the story goes, one evening brought both his dinner and his nightcap to him on the links. But McKellar blandly rebuked her for interrupting and suggested that she "cou'd wait if she likit till the game was dune, but at present he had no time for refreshment."

On Sunday, when McKellar could not play his beloved golf, he acted as doorkeeper to a church in Edinburgh. A fellow club member jocularly put a golf ball in the plate when McKellar passed it before him. McKellar quickly took possession of it as more appropriate to his interests than to any religious objective.

Another nighttime golf story is too good to be overlooked. About half-past ten it was decided to play a match of three holes. No lights were allowed except one lantern placed at the hole and another carried by the caddies so they might see to whom the ball belonged. Boys were placed along the course who were so accustomed to the flight of balls that they could tell where the balls had fallen by the sound as they hit the ground. The match was won by one hole and the winner was the richer by five hundred.

The old competition between archers and golfers led to an odd match on the Luffness Links on October 15, 1874. The Rev. Mr. Tait, chaplain to the Royal Company of Archers (Queens Scotch Body Guard) played a match with a bow and arrow against the club and ball of the veteran golfer, "old Tom Morris." When the round of eighteen holes was ended, it was found the bow had beaten the club. Unfortunately there are no details, only the news that Mr. Tait had done the round in seventy-six shots, while Tom Morris had taken eighty-two strokes to finish. By holes the bow won by five.

Although golf has been the national game of the Scots for almost five hundred years, the cost of the early golf balls made it a very expensive sport. These balls were made of leather stuffed tightly with feathers and cost four shillings apiece. The maker pressed the feathers in with a wooden pin fastened in a piece of wood and then pressed the board against his chest to cram in the feathers. This handwork accounted for the high price.

At first these balls were imported from Holland where the Dutch used them in Kolf, but to protect home industry, James IV, by an act of parliament, forbade their use on the links. A letter, dated August 5, 1618, says that "whereas no small quantitie of gold and silver be transported yierlie out of his Hienes' kingdom of Scotland for bying of golf ballis, his Majestie confers a monopoly of ball manufacture on James Melvil for the space of twentie ane yeiris." It was also mentioned in the act that cost of each ball "exceid not the pryce of four shillingis money of this realm" and that a stamp be placed on each ball to show its native source for all others were to be "escheated" (confiscated).

Feather balls have long been succeeded by gutta-percha balls and balls of various compositions. When the gutta-percha balls were introduced, though costing only one-fourth as much as the others, they were not favorably received. Golfers said the "gutties" ducked. The reason why was soon found out. When the gutta-percha ball was first tried out, it was quite smooth. In a few days, marked by the clubs, it acted much better. Keen golfers decided that the balls needed slight indentations and roughnesses to match the slight ridges made on the feather balls by the seams. So the chisel end of a hammer was used to make crisscross marks all over the ball and ever afterward the ball behaved in a most satisfactory manner. Hand-hammered balls were advertised until a mold was invented by which the balls could be scored while in the making.

Golf came over the Tweed—with one exception—about the middle of the nineteenth century. The exception is Blackheath where James VI of Scotland first played the game in England, or, as it was then known, the Knuckle Club. Its minutes were "quite as convivial as sporting" and bets were often made of gallons of claret. This club became the Blackheath Golf Club about 1822. At Pau, across the Channel, the next non-Scottish golf club had an informal existence until 1857, when under the spur of a gold challenge medal, offered by the Duke of Hamilton, it quickened and grew until in 1874 it organized a Ladies' Club where be-crinolined ladies played a refined game.

Founding of Westward Ho

WESTWARD HO, founded in 1833, was named after Charles Kingsley's book, which was written in the neighborhood. The shores of Bideford Bay reminded an enthusiastic golfer, one General Moncrieff, who was visiting the Vicar of Northam, of the links of St. Andrews. In a few days, the general had rallied a few fellow fans to his support and they began to play golf on this open land, their enthusiasm making up for the primitive condition of the links.

These pioneers used the putting greens as they found them, for Nature and the local sheep had kept the turf short. The holes were made with pocket knives and were without flags to mark them. The first party on the links each day located the hole, if he could, and marked it with a feather picked up on the way. If the sheep had trodden out the hole, he made another and stuck his feather there.

A year later, 1864, the club was instituted. First it acquired a tent, then a clubhouse, and eventually, all the paraphernalia, indoors and out, of a well-ordered golf club.

About this period a heavy argument came up anent the pronunciation of the word "golf." Should the "l" be sounded or is it mute? The Scotch disowned the "l" and gave every variety of pronunciation possible to the vowel. But an occasional scholar north of the Tweed rose in defense of the consonant while England clamored for it. "Goff" was their national game, and only the illiterate, they said, paid any attention to the "l."

But the English denied Scotland the right to decide this issue on the ground of primogeniture and insisted that they would not give way to the north in the pronunciation of a word now as common south of the border as north of it.

"Should words be used as the experienced use them or as they are spelled?" queried Edinburgh.

The English evidently succumbed to numbers for today one speaks of goff, and a goffer goes goffing when he goes to the links.

Golf in America

ANOTHER controversy that shook the golfing world somewhat about this time was the problem of what to do with the ladies. As guests they were privileged to watch the game of their men or to wait for them at the clubhouse; but not satisfied with these privileges, a few insisted on playing. Several clubs allotted a small corner for ladies' links, about enough space for a few short holes. But so undesirable were these sections that Lord Wellwood referred to them as a sort of Jews' quarter, that is, like the old-fashioned ghetto where the Jews were restricted. The noble Lord adds that there is no reason against women playing golf but advises that links for ladies be provided on all the larger greens, on a smaller scale of the "long round," with short putting holes, a few long holes, with a drive or two of seventy or eighty yards and a few "suitable" hazards. The seventy-yard is recommended, not because, this gracious golfer adds, ladies cannot make a longer drive but because such a drive cannot be made without raising the club above the shoulder and this posture is not graceful!

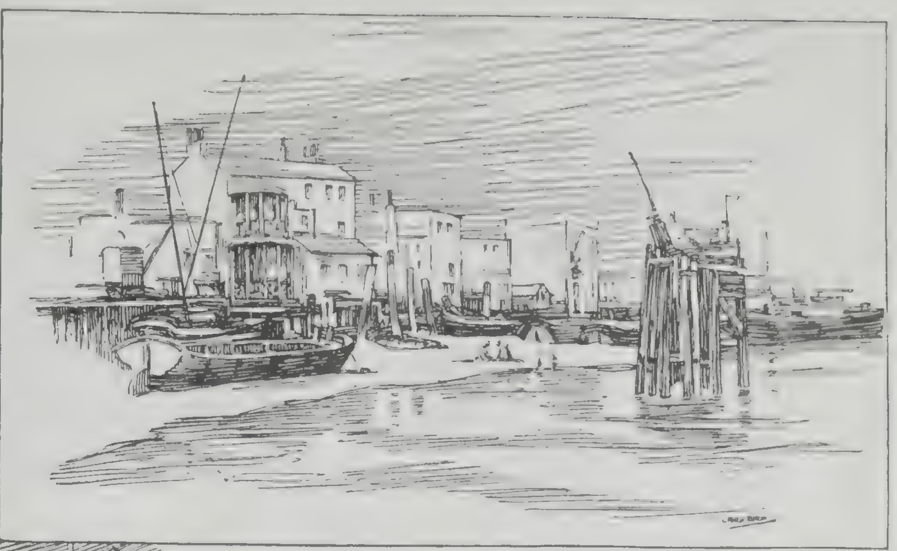
Very reluctantly did golfers admit ladies to their beloved links. Horace Hutchinson, in 1899, thought that women had better stay on their own grounds, best suited to their moderate length of driving, than to invade the longer links of the men. Until women develop a longer drive, this authority says, "it is no kindness either to them or to other players to let them loose on the longer links before their strength in driving has outgrown the shorter."

Five years ago, Mr. Hutchinson still thought ladies "would have been both better and happier on their own short putting greens" though he admits there are occasional players who appreciate longer courses and play them as well as men. But since it is inevitable that women use the same links as men, the resigned Mr. Hutchinson suggests the schedule used (*Concluded on page 14*)

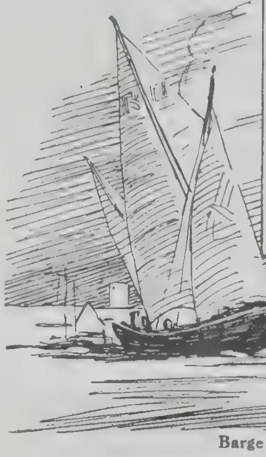
The Pool of London

Old Father Thames Tells a Story; Romance of a Famous Waterway

By W. TEIGNMOUTH SHORE



Limehouse.



Barge under sail.

THE Pool of London is that part of the Thames River immediately below London Bridge. In the ordinary sense of the term it cannot be called beautiful; but it has a picturesqueness of its own for those who have eyes to see it. Indeed, what river can be really ugly, however much it is used by man? For me the river of London has always had fascination; by night when it mirrors the myriad lights on bridges and embankments; by day when it ripples sparkling in the sun, or heaves lethargically beneath leaden skies, or runs mysteriously under a pall of yellow fog. The last time I was upon it was a gray-white day: mingled sunshine and cold showers. I set forth in a wherry from Old Swan Stairs, close above London Bridge; was rowed by a somewhat taciturn Thames waterman. Not by such a jolly young waterman as was immortalized by Charles Dibdin:

> "And did you not hear of a jolly young waterman,
>   Who at Blackfriars Bridge used to ply?
> He feathered his oars with such skill and dexterity,
>   Winning each heart and delighting each eye."

Sure enough mine was a man of great skill and dexterity; a brawny, sturdy middle-aged fellow, who knew every eddy and swirl of the tricky currents and swift tides. But when I asked what was this place and that—though for the most part I knew them well—he gave me the names pat enough, but there his interest and his knowledge seemed to end. Probably familiarity had bred contempt. What was all alive with humanity to me was matter of business only to him.

Yet the Pool of London is replete with history and romance. At our starting place, these Old Swan Stairs, Shakespeare and his fellow players must often have embarked and disembarked; many other famous wights also. "Stairs" were—and are—steps leading down from the river bank to the water's edge, for the convenience of those taking boats.

Looking across the water, we see the dim, dingy outline of the wharves and warehouses upon Bankside, where in Elizabethan days were the Globe and Swan playhouses, the Bear Garden, where bears were cruelly maltreated by huge dogs and still more savage men, and other places of entertainment, seemly and otherwise. There, too, is the stalwart square tower of Saint Saviour's, Southwark, wherein sleep John Gower, poet and friend of Dan Chaucer, John Fletcher and Philip Massinger, playwrights, and Edmund Shakespeare, younger brother of William. There, also, is the Harvard Chapel, keeping green the memory of the founder of Harvard, who was born in this parish and baptized in this church in the year 1607; who knows but that Shakespeare was present at the ceremony?

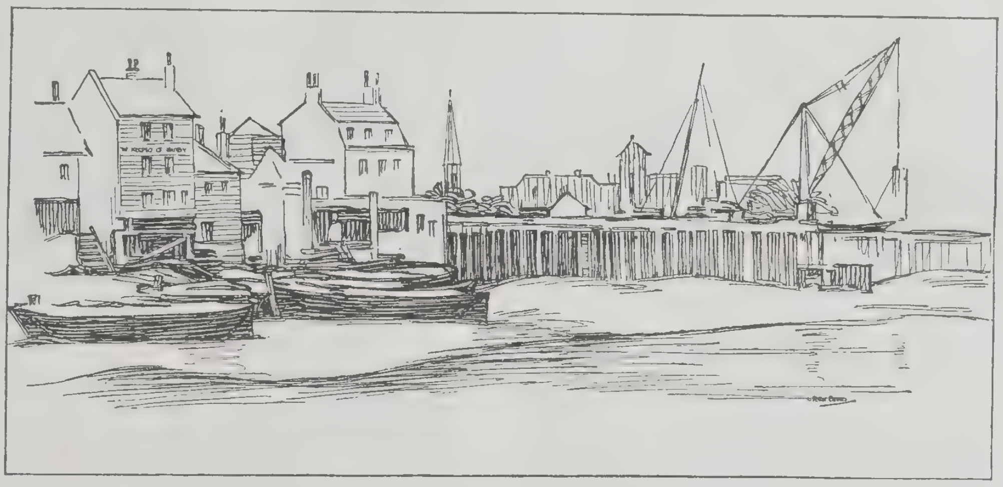
We pass beneath London Bridge: first built in stone between the years 1176 and 1209; rebuilt in 1825-1831. In olden days it was one of the wonders of the world, with its gallant rows of wooden houses on either side of the roadway, a chapel dedicated to Saint Thomas à Becket and a fortified gatehouse which was usually adorned with the moldering skulls of unsuccessful rebels and other rash persons. Today it is just a gray-stone bridge of no particular impressiveness, but always busy, day and night.

Now we are drifting downstream on the waters of the Pool. On our left hand is Billingsgate, the great fish market of London; known all the world over for the unsavoriness of the language said to be used by those who frequent it. For many centuries this wharf has been busy with fishing boats, English and foreign, including always at least one Dutch eel-ship. Then we float, for we go leisurely on our way, past the Custom House, a huge, cold, classic pile, of not much interest save from the merchants' point of view, and so to the Tower of London, next after Westminster Abbey the most historic building in London. The gray towers and walls seem to frown down on the river, fortress, prison, palace; innumerable are the bloody tales of cruelty and crime that its stones could tell! Is there any sadder spot on earth? Any more terrible memorial of the brutality of man? What fearful ghosts haunt its walks and dungeons!

> ". . . . London's lasting shame,
> With many a foul and midnight murder fed."

We will turn our backs upon history, looking across to a place made famous by fiction. That muddy, desolate inlet there leads up to Jacob's Island, where Bill Sikes met his end. It is thus described by Dickens: "Near to that part of the Thames on which the church at Rotherhithe abuts, where the buildings on the banks are dirtiest and the vessels on the river blackest with the dust of colliers and the smoke of close-built low-roofed houses, there exists . . . . the filthiest, the strangest, the most extraordinary of the many localities that are hidden in London . . . . Jacob's Island, surrounded by a muddy ditch six or eight feet deep and fifteen or twenty wide when the tide is in . . . ." As seen at low tide this inlet is shown in our picture: the massy bank of black, slimy mud looking strangely silver-toned under the white, sunlit clouds.

Some little way lower down is a more cheery spot, Cherry Garden Stairs, nearby which, in the days of merry King Charles II, was a well-known place of entertainment, visited among other gay folk by Master Samuel Pepys, who entered in his Diary under date June 15, 1664, this: "To the Cherry Garden, and then by water singing finely to the Bridge," meaning London Bridge. Fancy that! These gay companions, be-laced and be-plumed, singing as they were rowed homeward. In those days the Thames was the busiest highway in the city, and the brightest, and by a long way the cleanest; crowded with boats and galleys and often the scene of pompous pageantry. Now it is deserted by all save those who have business to do upon its waters.



The Prospect of Whitby Inn.

A little lower down, on the opposite shore, is Wapping; still "chiefly inhabited by seafaring men and tradesmen dealing in commodities for the supply of shipping and shipmen." It is not a neighborhood in which you would expect to fall on any trace of romance; nor would one so do but that songs have put its name upon the lips of thousands:

> "Your Molly has never been false she declares,
> Since last time we parted at Old Wapping Stairs,"

but we have only the lady's word for it. Dibdin sang of another Wapping beauty:

> "Your London girls, with all their airs,
> Must strike to Poll of Wapping Stairs,
>   No tighter lass is going
>   . . . .
> Her father, he's a hearty dog,
> Poll makes his flip, and serves his grog,
>   And never stints his measure;
> She minds full well the house affairs,
> She seldom drinks, and never swears;
>   And isn't that a pleasure?"

Surely so; but a sad slur is cast upon the manners of the other maidens of Wapping! Grog is usually rum and water, and was introduced into the British navy in the year 1745, or thereabouts, by Admiral Vernon, who was nicknamed "Old Grog" from his habit of wearing a *Grog*ram cloak! There are various kinds of "flips," into the compounding of which enter ale, spirits, eggs, butter, sugar and spices!

Hereabouts there are still some old, wooden, bow-windowed houses, leaning, apparently perilously, over the water; such, for example, as The Prospect of Whitby Inn. There are many of these quaint waterside taverns in this neighborhood: in Wapping, Shadwell and Limehouse. Best known of them is The Grapes at the last-named place, for it has been identified as The Six Jolly Fellowship-Porters in "Our Mutual Friend," wherein Gaffer Hexam, Rogue Riderhood and others disported themselves under the stern eyes of Miss Abbey Potterson; indulging in such giddy drinks as Dog's Nose, Purl, and Flip, doubtless such as Poll made for her father.

We are told that The Six Jolly Fellowship-Porters was a tavern "of a dropsical appearance . . . . a narrow lopsided wooden jumble of corpulent windows heaped one upon another as you might heap as many toppling oranges, with a crazy wooden veranda impending over the water." And "the bar . . . . was a bar to soften the human breast," and apparently to make jolly the hearts of porters and others fond of good fellowship. Those who know their way about this town can still find in this and in other parts old-fashioned taverns where there are softening bars; cozy places where there are good cheer and cheery faces to be enjoyed.

As all know, there is much about the Thames River to be found in Dickens, and about the riverside. What was there that he did not know and understand about London town?

It may not be out of place to mention that the Fellowship-Porters formed one of the London guilds or brotherhoods, the members claiming and until recent years retaining the right of unloading all vessels laden with grain that came into the port of London.

And what is Dog's Nose? It was a potent mixture made of beer and gin. There were—indeed are—two kinds of Purl, one concocted of beer or ale and wormwood, and the other of beer and hot spiced gin! No wonder the porters were jolly!

One of the busiest parts of the Pool of London is undoubtedly Limehouse. Here huge warehouses open wide their doors for the reception of merchandise from all over the world. Although the great majority of these warehouses are modern, there are still a number of the quaint old-fashioned buildings along the water front containing dark, poky little dens where in former years men lingered, like Dan Chaucer, "over bills of lading."

There was also at a much later period that strange conglomeration of ship wreckage and marine stores surrounding a dilapidated shed of an office, such as Dickens describes as Quilp's Wharf, in his story of the "Old Curiosity Shop." It was here that Quilp, that hideous hunchback, who was a sort of a shipbreaker and money-lender combined, used to resort to indulge in his orgies of rum drinking and spiteful railing against all that was good and wholesome in mankind.

It was at Limehouse that Lloyd George, in his palmy days before the World War, used to indulge in that other form of invective which added a new word to the English dictionary, namely, that of "limehousing." This is on a par with that other word, "billingsgate," which is used to designate language of a particularly lurid and abusive type, which was once heard in all its pristine forcefulness in that celebrated fish market to which reference has already been made. But the "limehousing" of Lloyd George was not abuse in the ordinary sense, it was rather a type of denunciatory rhetoric hurled at the heads of the dukes, and the marquises, and the earls, and the aristocracy in general, which was music in the ears of the denizens of that extremely radical part of London.

One of the most picturesque types of craft on the Pool of London is the barge. The Thames barge in its various forms has figured in the history of the river from time immemorial. It was in barges of a glorified type that royalty used to be conveyed in the days when the river was the main highway of the state processions of all descriptions.

Now we turn our wherry homeward. I sit lazily; smoking, dreaming. The sky is a pageant of gray and white clouds, sweeping across the blue; the sun shines bravely between the bitter showers of rain. All around is the turmoil of the busy seaport; but I heed it not, preferring to think of the days that are no more.

A barge, with huge tan-colored sail, goes slowly by; how much more dignity there than in the fussy motor boat that races past. When I was a tiny little boy it was always my ambition to live upon a barge, and indeed there are worse lives to be led! Even nowadays I have a hankering that way, believing that I could be very happy so, going placidly about the waterways of old England

But here I am again at Old Swan Stairs.

Frances E. Willard School, a Mother's Shrine

Concluded from page 3

presidency the national society grew rapidly. Following her death, February 18, 1898, the Hall of Immortals in New York University enshrined her memory, and seven years later, in 1905, the United States Senate and House of Representatives suspended business deliberations to receive with appropriate ceremony the marble figure sent to Statuary Hall by the legislature of her adopted state of Illinois.

Books which she read, garments which she wore, letters written by her, are now treasured and collected by historical societies. Even the old phaeton in which she rode has been reclaimed recently and stands on a platform near the famous carriage of Daniel Webster in the State Historical Museum at Madison, Wisconsin. Sold to a junk dealer for $5 after it had been unnoticed for fifteen years, the surrey which was used by Miss Willard was rescued from oblivion.

A phaeton and surrey have rested many years in the barn back of the home of the late Mrs. Joseph Emerson, cousin of Miss Willard, at Beloit, Wisconsin. They were disregarded by all but one neighbor who had heard Mrs. Emerson relate their history years ago. The Emerson property, which is now owned by Beloit College, included the two buggies. When a junk dealer offered Professor E. S. Haynes, business manager, $9.25 for the two vehicles and the harness which was with them, the bargain was made.

But the observing neighbor did not want to see the relics meet so ignominious an end. The president of the Beloit W. C. T. U. was notified, and all efforts of the association were bent on securing the venerable surrey and phaeton. When the president of Beloit College, Dr. M. A. Brannan, learned of the unfortunate disappearance of the relics, a search for the junk dealer was instituted. But, alas, the dealer had disposed of the phaeton for $15 and only the surrey could be located. In respect to the memory of the great temperance union founder, the surrey was bought by the college and presented by the Beloit W. C. T. U. association to the State Historical Museum where it was received in the autumn of 1923 with deliberate ceremonies.

Long before national prohibition was assured, however, her services to the nation were acknowledged. The dedication of her cenotaph in Statuary Hall was equaled only by the memorial honors accorded a President. Men of national reputation were the speakers. Senator Cullum, of Illinois, made the presentation for his state and addresses were delivered by the late Senator Jonathan P. Dolliver, of Iowa, and Senator Albert B. Beveridge, of Indiana. At the exercises held in the House of Representatives, the speakers were Congressman Foss, of Illinois, and Mr. Littlefield, of Maine.

"I have witnessed at the Capitol today a scene the like of which has never taken place before—thousands of children covering a statue with flowers and thousands of women standing before it in silence and in tears," declared Senator Dolliver in an address recording the fleeting event. "We are met to put in place another pedestal; to accept another statue donated by the people of the nation. It is brought here by a state rich in the household treasures of its biography—the state which gave to American politics the leadership of Stephen A. Douglas; the state from which Abraham Lincoln set out on his triumphal journey to the Capitol; the state which signed the first commission of General Grant; the state in which John A. Logan was born, and from which he went forth to become the ideal volunteer soldier of the Republic. Yet the great commonwealth passes all of these by and brings here, with reverence and pride, a work of art so full of gentleness and grace that all the illustrious company about it seems to bow with stately ceremony before the white figure of this elect figure of Illinois—Frances E. Willard."

Statuary Hall in the Capitol, where Miss Willard stands as the only woman representative, is redolent with national memories. When the chambers now occupied by Congress were completed, the problem arose over the use to which the old rooms should be placed.

Schoolhouse of Frances E. Willard in the Rock River Valley has been dedicated as a shrine.

The Senate, where the debates of Webster and Hayne and scores of other controversies had been witnessed, was remodeled for the Supreme Court. Disposition of the historic meeting place of the Representatives was not so easy. It was Senator Morrill who made the suggestion, which was enacted into law, that it be set apart as a national memorial hall, and that each state be invited to provide two statues of its illustrious citizens to be placed on its floors.

Less than half a century before the sacred recesses of this chamber were resounding to the thrilling tones of Henry Clay; earlier they echoed to the chiding sarcasm of John Randolph of Roanoke and still later to debates over the troublesome idea of David Wilmot, who insisted that his "proviso" be attached to compromise legislation so as to check the spread of slavery.

More than twenty commonwealths have responded to the invitation. Sculptured forms of Robert Winthrop and Daniel Webster are there for Massachusetts; Roger Williams for Rhode Island; George Clinton and Robert Fulton for New York; Ethan Allen for Vermont; Roger Sherman for Connecticut; Oliver P. Morton for Indiana; James A. Garfield, the only man who has served as a President and to be recognized, stands there representing Ohio, with still other favorites of states.

Arranged in the space are statesmen and orators, with a smile on their lips as if they would speak; soldiers are there with sword in hand; inventors whose genius has given ideas to lift the burdens and labors of the world are reposed and priests stand poised to offer the benediction.

It is in this august chamber, where the political history of a nation marched majestically from the Jefferson Administration to the opening of the Civil War, that the white marble statue of Miss Willard has been ushered. There she is shown in the pose in which the millions of the earth knew her best. She is standing on a platform, resting one arm on a reading table, delivering one of her lectures for the cause of temperance.

On the base at her feet has been carved her tribute to the mission of women:

"It is women who have given the costliest hostages to fortune. Out into the battle of life they have sent their best beloved, with fearful odds against them. By the dangers they have dared; by the hours of patient waiting over beds where helpless children lay; by the incense of ten-thousand prayers wafted from their gentle lips to heaven, I charge you to give them power to protect along life's treacherous highway those whom they have so loved."

The national remembrance of her meant more than the praise due a departed leader. She was lauded for her womanly Americanism. This was the first official recognition of the advance which had been taken by women in the new order of things. The changing era had begun about the time of her birth. Oberlin College, Ohio, in 1838, was the first institution to grant a diploma to women. The work and influence of Miss Willard sped the day for their enfranchisement, a cause which she championed; she urged legislation for a better protection of the home and she also demanded "courts of national and international arbitration which would banish war from all the world." She was a reformer, but of such a poise that she did not call down upon herself the animosities that are generally heaped on those who would side-track the old routine.

But above the cenotaphs that have been raised and tablets dedicated to her memory; over all the volumes written about her life, the scene of the little white school building in the Rock River Valley haunts memory most. By its dedication, the common school of America has been enshrined for its service; its high ideals glorifying the homes from which come the little children.

Miss Willard is buried near Evanston, the scene of her later labors. Yet the mothers of America ask not the way. They go direct to the place from which she drew her early inspiration. For them, the surroundings during her aspiring girlhood are more appropriate as a memorial. The Frances E. Willard school has become a shrine.

Where the Turk First Stepped on Europe

Concluded from page 5

a perfect crescent, and near it the evening star, in the relative positions they occupy on the red flag of Turkey, and I wondered if this was a good omen for the future of the regenerated country under the leadership of Mustapha Kemal. It seemed symbolic.

Another afternoon and we left Constantinople behind, the city which has stood more sieges than any other in the world since it was Byzantium, and it glowed in the soft radiance of the late afternoon as it had a few days before when we came, St. Sophia bidding us farewell as it was the first to greet our eyes when we arrived.

The seas were again kind and without a ripple except those we made ourselves as we retraced our course to Smyrna for a few hours and then headed for Rhodes, another mystery place, an island snuggling close to the mainland of Asia Minor. Never was water so blue as that which laves the shores of Rhodes and never was a town more quaint than this which was built by the Knights of St. John who made it a bulwark of Christianity against the Turks until it fell into their hands in 1552. Since the Great War it has been under Italian control and the uniforms of Italian soldiers are met on the streets.

Rhodes, the whole island, has a population of 40 000, and grapes, figs and olive oil are its principal products. The island is somewhat barren, but the city of Rhodes itself is flower-decked from its many gardens. There are ancient walls and forts built by the knights long before the days of the Turks, the gates of the walls being no longer used. There is not an automobile on the island and there are few carriages, but there is a bathing beach bright with the same sort of tents that shine on the sands of Deauville at the height of the season.

There is little wood on the island, the houses are built of stone and have the most curious floors imaginable. These floors are made from small, smooth stones taken from the beach and are set on end close together. By making use of different colored stones, red, black and white, the householder weaves a pattern for his floor as delicate and intricate as any rug, and much more interesting.

Leaving Rhodes and heading to the southeastward we made a short stop at Larnaka, the principal port of English Cyprus, where we heard the English language for the first time since leaving Malta, and then on to Beyrouth, chief seaport of Syria, and the end of our outward voyage. Here for the next two weeks our travels were to be by motor and train.

More Destructive Than the Boll Weevil

Concluded from page 11

association, such as the hop-driers, the wool-graders and washers, the grain elevators in the Pacific Northwest, and the tobacco warehouses in Kentucky. So there was a side issue to the Staple Cotton Co-operative Association of the Yazoo River Delta. This was and is the issuance of "cotton certificates" in denominations of $2,000 each, backed by cotton held in the warehouses of the association. These certificates bear six per cent, run five years and are tax exempt. They should sell at more than par, but, as a matter of fact, the banks throughout the South will allow only eighty per cent on them. This is a reduction of $200,000 on every $1,000,000 worth of the certificates issued, or about four times the cost of selling the cotton, even under the heavy expenses of the association, and twenty times the cost of its sale outside the association.

Aside from these factors of bad merchandising, *the cotton planters who formed the association have lost control of it*, that control having passed to the board of directors; cannot sell their own cotton when they wish to sell it, or direct the board to so sell it; and cannot accept the peak price, but must await the division and sale of the cotton, month by month, on the "orderly marketing" scheme. It is small wonder that many of the leading planters of the Yazoo River Delta are turning over their plantations to their wives, leasing them to their sons, and endeavoring by other expedients within the law to escape the situation into which they were lured by promises which never have been fulfilled, and which, under the Sapiro Plan, never can be fulfilled.

Drove Golf Balls Over Cathedral Spire

Concluded from page 12

in Biarritz. One afternoon in the week is set apart for ladies, but those whose handicap is four or under may play at any time and on equal terms with the men. This prevents cluttering the links by inexperienced players and would bring even more happiness to the golfer if the same limitations applied to masculine members of his club.

Golf in America has not much of a past. There is slight mention of it in Knickerbocker history, though it is said the Dutch were ardent golfers. In 1600 the Worshipful Commissary and Commissaries of Fort Orange and Village of Beverwyck (Albany), "having heard divers complaints from the Burghers of this place, against okaying golf along the streets, which causes great damage to the windows of the houses, and exposes people to the danger of being wounded, and is contrary to the freedom of the Public streets," did forbid all persons to play golf in the streets, "on pain of twenty-five florins fine for each person who shall be found doing so."

A few centuries pass until the Philadelphia *Times* on Sunday, February 24, 1889, takes up the subject of golf again. It says, "Up to this time golf has made little way in the United States." Though the *Times* adds it is far from being a "dude" game, it calls golf an aristocratic exercise and ends with "It is not a game which would induce men of elegant leisure to compete in, but those who have strong wind and good muscle may find in it a splendid exercise for their abilities, and plenty of chance to emulate each other in skill and physical endurance."

In the thirty-five years since the Philadelphia *Times* printed these words, golf has become the fashionable sport of the tired business man—and yea—girl, as well. The gradual opening of public links is helping to bring back to this royal and ancient game its early popularity with the general public.

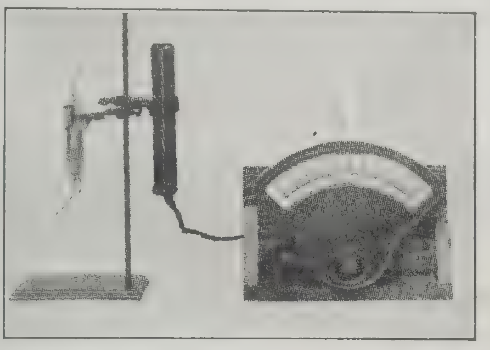
International Science Briefs

By DR. ARVID REUTERDAHL

President, Ramsey Institute of Technology, St. Paul, Minnesota.

Using the Vacuum

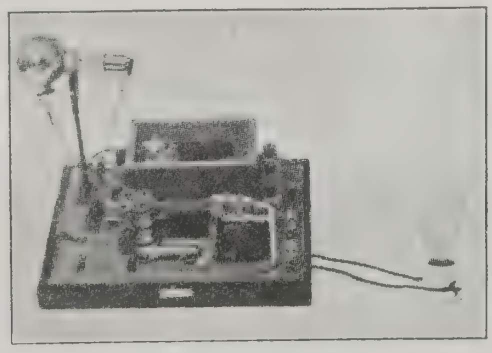
THE word *vacuum* literally means "empty," and signifies that a certain portion of space is entirely devoid of matter. Physical action is impossible without the presence of matter in space. How then may a *vacuum* which contains no matter be used? It is evident, of course, that while a certain space is free from matter no observable physical event can take place within it. Yet it is this very fact which permits a vacuum to be of great service in scientific investigations because definite types of matter, under prescribed conditions, can be introduced into such empty spaces and the behavior of these matter groups may be studied in isolation from those matter aggregates which constitute our atmosphere. In this sense, therefore, we can actually make use of a vacuum.



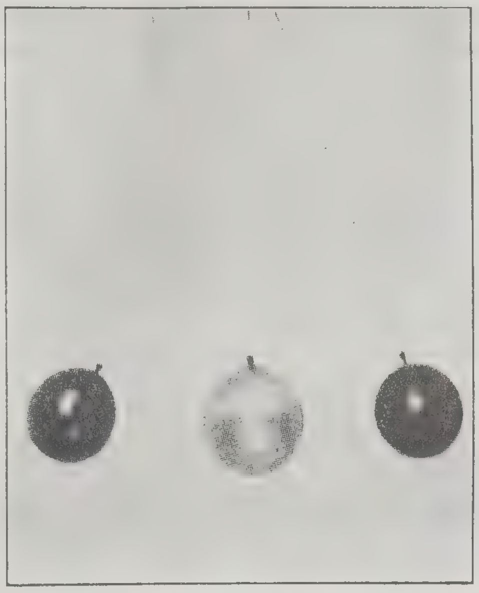
The magnetic field explorer.

When we speak of an *absolute* vacuum we refer only to an ideal limit. In such a vacuum *no* matter is present. Practically we deal only with *partial* vacuums. Evangelista Torricelli (1608-1647), the Italian physicist, invented the barometer in the year 1643. His assistant Viviani actually performed the experiment which led to this invention. At the suggestion of Torricelli, Viviani filled a glass tube, which was closed at one end, with mercury and then inverted it beneath the surface of a vessel containing mercury. It was found that the column of mercury in the tube would sink, finally coming to rest when its top surface was about thirty inches above the top surface of the mercury in the vessel. Torricelli reasoned that the weight of the mercury column in the tube was balanced by the pressure of the atmosphere on the mercury in the vessel. He also concluded that the space in the closed end of the tube above the top surface of the mercury column was practically free from air particles, thus constituting a vacuum. By means of this experiment, which underlies the principle of the barometer, Torricelli produced, for the first time, what is known as a *high* vacuum.

The Torricelli vacuum, however, actually contains a small residue of mercury vapor and traces of air. The Torricelli method of producing a vacuum in addition to being inefficient is not convenient. This fact led to the use of some form of pump which was used to exhaust the air, gas, or vapor in the space where the vacuum was desired. Otto von Guericke, about 1654, invented the mechanical air pump. Geissler in 1855 introduced the mercury vacuum pump. In the year 1865 Sprengel brought out his type of mercury pump. G. W. A. Kahlbaum in 1901 constructed an improved Sprengel pump by which he was able to obtain an exhaustion equivalent to a pressure of 0.0000018 millimeters of mercury. The molecular air pump of Dr. W. Gaede effects an exhaustion corresponding to 0.0000002 millimeters of mercury. Compared with the Gaede pump the water pump and the ordinary piston pump are very inefficient, the former producing an exhaustion corresponding to about ten millimeters of mercury, and the latter about one millimeter.

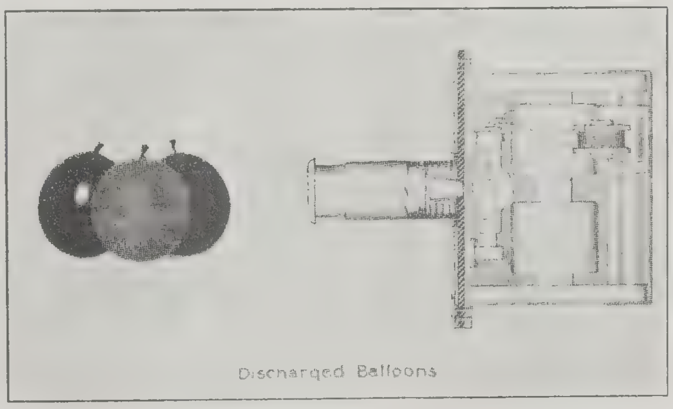


The photo-electric cell vacuum tube.

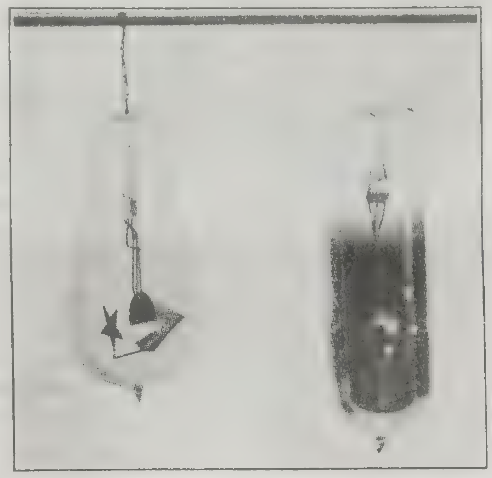


Electrically charged balloons.

Dr. W. R. Whitney, director of the Research Laboratory of the General Electric Company, writing in the current number of the *Scientific Monthly,* states: "We all know that we see at night largely by the aid of vacuum lamps. Through other vacuum lamps, called X-ray tubes, we also see through opaque bodies. The light which illumines our microscope specimen has its analogue in the X-ray light which shows us the crystal structure of matter and the electrical formulae of chemical atoms. Our transcontinental wired telephony is possible through vacuum tubes which, in various forms, also permit our wireless broadcasting and wireless reception from the most remote stations. The workman who keeps his drink hot or cold in a thermos bottle is clearly indebted to Sir James Dewar's application of the vacuum, but the scientist is still more indebted to it. All our steam power plants, including turbines, owe their success to vacua." In an address delivered before the Cincinnati meeting of the American Association for the Advancement of Science, Dr. Whitney showed many uses of the vacuum by means of actual experiments. We are indebted to Dr. Whitney and the *Scientific Monthly* for the illustrations of the apparatus used during this lecture. His paper dealt more particularly with the effects produced by electric currents through *high* vacua. He stated, "After the work by which the individual and indivisible negative electrical charge or electron was defined, it seemed quite fitting though unexpected, to learn that these negative charges were exuded by hot bodies. The result of this disclosure formed the basis for most of the modern electrical phenomena in vacua. The activities of electrons are apparently the cause of most electrical and chemical processes. Their motions constitute electric currents and the currents are determined and controlled by voltage or potential difference."



Balloons discharged by X-rays.



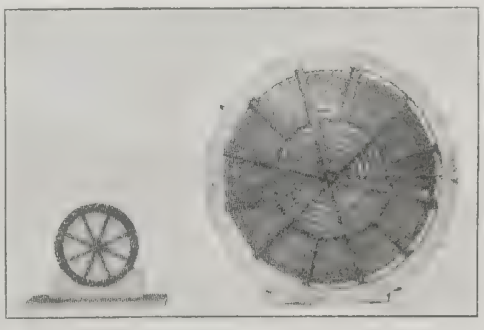
Distillation in a vacuum.

Dr. Whitney discussed the various grades of vacua. At one time, he states, the vacuum of the incandescent lamp was considered quite superior. Today the vacua of good thermos bottles, X-ray tubes, radiotrons and other wireless tubes are far better than that found in the ordinary incandescent lamp bulb. When filaments are distilled in vacua metal shadows of interior parts of the lamp are cast upon the walls. This proves that the distilled substance moves within the tube in *straight lines* from the heated source. In the illustration the shadow of a star is shown on the wall of the tube.

The vacuum tube is used in exploring the earth's magnetic field. The apparatus consists essentially of a cylindrical plate in a vacuum tube and a central filament within it. A coil of wire is wound around the outside of the glass. A magnetic field may be generated within the coil by a feeble current from a battery. "When the apparatus is moved about in space (thereby at one time adding to the earth's field, at others opposing it), the magnitude and direction of the earth's magnetic field can be disclosed by a meter which indicates the resultant current."

Dr. Whitney showed a photo-electric cell vacuum tube during his lecture. This tube was connected by a relay to an electric lamp. When the light shone upon the photo-electric cell the burning electric lamp was extinguished and was relighted when the light was prevented from acting upon the cell. As Dr. Whitney put it—"It turns on the lights when it is dark, and turns them off when it is light. Some metals like potassium emit electrons when light falls upon them. These in vacua constitute a current when they are made to move by the electrical impulse. Applying potential to a vacuum tube having a potassium electrode and another electrode for leading off the current causes current to flow as negative electrons from the illumined metal, and this current actuates the electrical switch which turns off the lighting current.

Charged balloons may be discharged by a feeble beam of X-rays proceeding from a vacuum tube. The Hewlett loud speaker depends upon vacuum devices for its faithful reproduction of sound.



The Hewlett loud speaker.

Paris is so generally taking up the English habit of daily baths that the water supply is feeling the strain.

The Dutch intend to erect a dike from the North Holland coast to Wieringen, thence to Friesland—a total length of eighteen and three-fourths miles, which will facilitate the reclamation of nearly 500,000 acres of good loamy soil.

Chinese housewives of Shanghai yearned for hot biscuits, so an enterprising German chemist has erected a plant for the production of compressed yeast in that city, and as it is the only plant of its kind in the Far East the product is being sold as far south as Singapore and as far north as Harbin.

The sandalwood tree of Burma is one of the most valuable and beautiful timbers in the world. Only the fragrant-scented heartwood has any commercial value. The trees are stripped of branches and the logs allowed to lie where they have fallen. Billions of ants devour the soft, sappy wood, which is useless in commerce, leaving the hard heartwood of the tree stripped of its worthless integument, thus saving labor for the owner of the timber.

One of the dogmas of the Arabian Akhwans is the sinfulness of tobacco smoking. Men have paid the supreme penalty for smoking in Wahabiland. Murder, adultery, and theft are trifles compared with tobacco smoking in the opinion of these people.

Due to hygienic conditions and the trades taught in Sing Sing prison, prisoners are showing a disinclination to escape. The superintendent of industries at the penitentiary has suggested a reduction in the number of guards and an increase in the number of instructors.

Three months and a half of daylight in the Alaska Territory make it possible to turn out the switch lamps on a part of the main line of the Alaska Railroad.

More than two billion dollars' worth of crops in the United States are destroyed annually by insect pests. There are more than one hundred different kinds of these pests, most of them being immigrants from foreign countries where control measures are not rigidly enforced.

"Coolie" is from the Hindu word "kuli," meaning laborer.

The Hungarian peasant woman believes in the "cave man" theory, and is disappointed if her husband fails to treat her rough. When a woman is dissatisfied with her husband she exclaims, "He did not even beat me once!"

Violators of traffic laws in Chicago henceforth must submit to a test of their eyes.

A living, beating heart has been transplanted from one living body into another. The experiments were on embryo salamanders.

In Arabia justice is swift and sure. A man robs a caravan, and in less than twenty-four hours his decapitated body will be lying in the dust of the public market place as an object lesson for the entire community. No time is wasted in long-drawn-out legal formalities.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Visitors to the British Empire Exhibition are warned to watch out for a giant magnet weighing some three tons which snatches umbrellas, pocketknives—anything made of steel or iron—from unsuspecting visitors as they pass by. Fifty tons is its pulling power.

The city of Portland, Oregon, will erect a statue of Joan of Arc in a public park in honor of the French pioneers that settled in that section. The statue will be a replica of the noted figure modeled by Fremiet, now standing in Paris.

Krupps, German gun manufacturers, are now making single and double rows of teeth of enameled steel.

One of the greatest diamond rushes in the history of the world has just taken place at Zeekoefontein, on the banks of the Vaal River in South Africa. The owner of a farm in that district discovered diamonds and has been making an average of two or three thousand pounds a week. Three thousand men and boys of all classes have rushed to stake claims.

The Arabian sheik exercises unlimited power. No legislature embarrasses him. No judiciary causes him trouble. He is the government and performs all its functions. The office is hereditary and is passed on to the oldest son.

Only one horse-drawn conveyance passed through the gates of the Seneca County, New York, fair this year, while the number of automobiles amounted to more than 1,000 daily. Two years ago about the same number of both kinds of vehicles passed through the gates, while five years ago the number of automobiles was greatly in the minority.

Telephone calls are numbered as they reach the exchanges in France. If a subscriber loses his temper and rattles the receiver-hook, his turn is placed at the end of the list.

"Jewish immigrants are flooding Mexico, from Poland, Russia, Germany, Austria, Turkey, Arabia, even Palestine. Yet all of them are called simply *extranjeros*—foreigners—or more specifically *Rusos, Alemanes, Turcos, Arabes."—Anita Brenner.*

In Northern Africa there is a large petrified forest similar to our petrified forest near Holbrook, Arizona.

There are about five hundred swans on the Thames River in England.

The dingo, or wild dog of Australia, is the sheepman's worst foe as it destroys many sheep in a single night's hunt.

France began systematic tree-planting along its national roads in the reign of Francis I, more than three hundred years ago. When a contract is let for a new state road in France the specifications include the trees to be set out, and the contractor is responsible for his trees for two years after he sets them out.

American population increased practically 2,000,000 in 1923. In the latter half of the year, we grew 1,122,000. Immigration contributed 505,000 and the excess of births over deaths 617,000. Without the immigration factor the United States is increasing to the extent of about 1,234,000 a year.

The original manuscript of Joseph Conrad's first novel sold at the John Quinn sale last year for $5,300. Thirty years ago, when it was first published, it attracted only a small group of admirers and was considered a complete failure. At the sale the first edition sold for $120.

In Japan there are two hundred thirty-six different associations working for temperance, with an aggregate membership of 117,982.

The National Museum is engaged in assembling an historical collection of radio devices which will place on permanent record a vivid exhibition of this rapidly expanding art of communication.

Corn with stalks so short that the ears appear to grow directly out of the earth and that mature in seventy days is now being grown at experiment stations in the United States.

Only five lynchings occurred in the first half of the current year in the United States.

"The truth is, a farm will not make an honest man rich in money. I do not know of a single instance in which a man has honestly got rich by farming alone. It cannot be done. The way in which men who have farms grow rich is either by other resources, or by trade, or by getting their labor for nothing, or by other methods of which I could tell you many sad anecdotes."—*Ralph Waldo Emerson.*

The Senussi, natives of the Libyan Desert in North Africa, have an immigration exclusion act of their own. They do not want *any* aliens to come into the country, for they say foreigners mean domination, domination means paying taxes, and they do not want to pay taxes.

The opium poppy was first known among the Greeks and Romans. It spread eastward, carried probably by Arab traders.

In the hills of Sicily mail is carried under armed guard on the backs of burros.

Premier MacDonald has the greatest private Socialist library in existence.

Cancer—Its Cause and Prevention

(C) Pacific and Atlantic Photos, Inc.

DR. JOSEPH COLT BLOODGOOD

This interview with Dr. Bloodgood cannot have a better preface than the following incisive introduction by the eminent cancer specialist himself.

THOSE of us, in the medical profession, who have been studying cancer for a quarter of a century, agree that at the present time the only means of reducing the number of deaths from cancer rests upon the education of the public on the importance of examination and treatment in the preventive or earlier curable stages, and the education of the medical profession on the recognition and most effective treatment in these earlier stages.

The American Society for the Control of Cancer, a philanthropic organization, is attempting in every way to get before the public and the profession this correct information, and to expose all quack cancer cures and publications of incorrect information.

It is for this reason that we must embrace every legitimate means of getting the truth to the public. It is very important for the reader to know that this interview consists of two parts—one, that in quotation marks, is copied verbatim from my published articles, and that without quotation marks is what Mr. Anderson has written from the notes of our interview, or from my writings. I have made no corrections, but when his statements do not convey the information clearly from my point of view, I have restated it in parentheses.

This will show the reader some of the difficulties of one who knows about cancer to get the correct information to the public in such a way that it is clearly understood.

Here is an interviewer, of unusual intelligence and experience, who first reads all that the one to be interviewed has written for the public on cancer, and then asks him some thirty prepared questions, the answers to which are taken down by an expert stenographer.

It is surprising the small element of error; but some statements of mine are slightly misunderstood and a few statements which I gave, as coming from other authorities, have been credited to me. As far as I know, no interview has been published with corrections made in this way.

Disease in the Soap and Water Stage

Lumps—Some Are Harmless, Some Deadly

By JOHN D. ANDERSON

The article on cancer contained in the Encyclopedia Britannica (1910) says that—Dr. Joseph Colt Bloodgood in my interview with him at his office in Baltimore a few weeks ago did not let me get any further.

Anything which the encyclopedias say or which any writer on cancer has written within the last five or eight years can with safety be disregarded and thrown into the waste-paper basket. We have been making cancer cure history so rapidly that what this one or that one said or wrote ten or twelve years ago is of practically no value. (The article in the Encyclopedia Britannica was written in 1910. The education of the public as a possible control is not mentioned.)

From this point there was nothing to do but let Dr. Bloodgood direct, rather than for me to suggest, the scope of our interview. He anticipated at least ninety per cent of the questions which were in my mind and touched upon all of them.

It must be understood at the outset that cancer and its treatment is as old as the history of man. The ancients are known to have suffered from cancer.

We began to make some marked progress in the treatment of cancer and effecting cures in cancer cases in this country about 1890, largely due to the efforts and work of Dr. William S. Halsted (Chief Surgeon, Johns Hopkins Hospital). There is practically no difference in the treatment of cancer by operation from then down to the present moment. (Halsted, of Johns Hopkins, should be credited with the original conception and the correct account of the modern effective operation attack on cancer removal en bloc [1890]. The attack through the education of the public came later [1913].)

But I am talking about the cure of cancer, Dr. Bloodgood. What can you say to me about this?

"The cure of cancer at the present time is not a drug, nor a serum, nor a ray, nor a miracle, but simply the education of the people as to the signs of its beginning in local lesions, and the importance of an immediate examination which will lead to recognition and treatment in the most favorable stage for a cure."

To this he added: If, for example, you discover a lump anywhere on the body, or a sore, an ulcer or a patch (white patch in the mouth) which has not promptly healed, it is not wise to wait one moment; go to your doctor and be examined. There is very little chance, of course, that you are suffering from cancer, *but you may be;* and if it is cancer you probably can be quickly cured. If you wait just a little too long the chances may be very much against it. It is important to go to the doctor the very moment that you find any condition of the character which I have mentioned. This is what I call treating cancer in the soap and water stage.

You probably know that in England a hundred years (50 years) ago and even before, a most common sort of cancer was that of the skin and suffered by chimney sweeps. These people probably all died of cancer. Today a cake of soap, a bathtub and a bath would have cured all of them (provided they took the bath). It is, you see, largely a matter of keeping clean.

I have been treating cancer for about thirty years. I have never yet seen a beautiful or even a good-looking woman suffering from cancer which destroyed the appearance of the face. This type of woman has pride in her appearance and by keeping her skin clean keeps free from cancer.

Some of the anti-tobacco societies have tried in one way or another to induce me to say or make it appear that I have said that the use of tobacco causes cancer. There is not at present the slightest evidence that the use of tobacco (alone) does any such thing. The man who uses tobacco can be just as clean as the man who does not use it. We do find, however, that the man who uses tobacco in a dirty way and lets his teeth get all dirty and decayed frequently suffers from cancer of the tongue, lip or membrane of the mouth. This type of cancer is very common and if taken in its early stages can nearly always be (prevented or) cured, but it must be taken in time.

Is cancer, or any particular type of cancer, on the increase, Doctor Bloodgood?

No, I do not believe—there is certainly no indication—that cancer of any type or cancer confined to any particular part of the body is on the increase. Of course, more persons are being treated for cancer today simply because they have been educated up to the point of knowing the necessity for early treatment.

Dr. Joseph Colt Bloodgood, today perhaps the best-known cancer surgeon and specialist in the United States, was born in Milwaukee, Wisconsin, on November 1, 1867, and is the son of Francis and Josephine Colt. He attended the University of Wisconsin and was graduated in 1888, and in 1891 completed his medical studies at the University of Pennsylvania. He became resident physician of the Children's Hospital of Philadelphia in 1891-2 and assistant resident surgeon of Johns Hopkins Hospital, Baltimore, from June to November, 1892, where he attended the foreign clinics during that period and served as resident surgeon at Johns Hopkins until 1897. He then became associate surgeon at the same hospital, serving from 1897 to 1903; has been associate professor of surgery at Johns Hopkins University since 1903 and also associate surgeon of Johns Hopkins Hospital, chief surgeon of St. Agnes Hospital and likewise consulting surgeon in the Cecil County Hospital at Elkton, Maryland. He has served as surgeon at Washington Hospital, Hagerstown, Maryland. He is a Fellow of the American Association of Surgeons. Dr. Bloodgood is a member of the American Association of Pathologists and Bacteriologists, the Association for Cancer Research, the American Society for the Control of Cancer and many other organizations dealing with the subject of treatment and control of cancer. He has contributed chapters on "Surgery" in "Progressive Medicine and International Clinics, 1889 to 1917," "Diseases of the Female Breast"; "Kelly-Noble Gynecology and Abdominal Surgery"; "Binnie's Surgery"; "Diseases of the Jaws" is contained in Bryant and Buck's American Practice of Surgery. He also is one of the editors of the *Journal of Cancer Research.* His home is in Roland Park, Baltimore. He married Edith Holt, daughter of Henry Holt, on September 1, 1908.

With rarest exceptions we are all warned in time of threatening diseases, but we must be informed by the medical and dental profession how to act in time. The warnings of serious diseases do not differ from the warnings of "sicknesses" that are not serious; so that when warned in time one should act immediately and seek examination by one's medical advisor or family physician.

"Cancer is largely a disease of ignorance and sometimes, to express it boldly, largely a disease of dirt. Any irritation of the skin that makes it rough makes it more difficult to clean. The rough, dirty area itches, makes the human being as much of a scratching animal as the dog! The rough area, the dirty area, the area of bleeding from scratching is the soil in which cancer begins. In this very early stage cancer can be prevented by the frequent use of hot water and soap, followed by medicated alcohol, and then followed by white vaseline or petroleum."

"In this sense cancer of the skin is a preventable disease.

"Lumps are like mushrooms—some are harmless and some are deadly. Only an expert member of the medical profession can tell the difference between the harmful and harmless lump. The best time to examine or remove the harmful lump is the day after it is felt."

What do you believe, Doctor, will be the method by which cancer will be most successfully treated and perhaps finally eradicated?

If taken in time, cancer may be cured and the menace of it may at some future time be entirely eradicated. This is going to depend upon the individual and how rapid a progress we can make in the education of the individual. Here in the Baltimore area I think the people are about as well educated up to the speedy consultation with their physician and attendance at cancer clinics as in any part of the United States. The American Society for the Control of Cancer has done wonders in this work. Cancer Week has helped but there are still thousands who die of cancer, simply because they do not take advantage of what is offered them. Here at our clinics the poorest person can obtain the same treatment, the same high class of examination, regardless of his race, creed or color, that the millionaire can obtain for himself or a member of his family.

"The sooner cancer can be eradicated from a person the more likely it is that it will never return. In the average case where it is eradicated and does not return for a considerable period, say five or ten years, it is not likely to return."

Dr. Bloodgood then interestingly discussed certain statements which have frequently been made, as, for example, the assertion that cancer is a disease of civilization; that uncivilized peoples do not have cancer.

He is positive that there may be an error in such conclusion and that the claim that cancer rarely or never occurs among some of the tribesmen of Africa, India and the islands of the Pacific is not a fact. (A savage tribe in Africa chew and carry an irritating nut in their mouths. Many develop cancer in the mouth, just as the highly civilized man who uses tobacco and has ragged dirty teeth often suffers and dies of cancer of the oral cavity.)

People who eat meat in large quantities get cancer and people who eat no meat get cancer! This brings up the whole question of diet in cancer cases. Of course, most of us lead a pretty strenuous life; hasty eating; the formation of acids in the stomach, may have something to do with stomach cancer; perhaps it does, perhaps it does not. In the case of cancer in the stomach or in the intestines my (I was quoting Dr. William Mayo who suggested that the constant taking of very hot and ice-cold food might produce an irritation which in time might produce cancer of the stomach. But hot and cold food would not explain cancer of the colon and rectum.) rule is not to permit the patient to eat very warm or very highly seasoned food; otherwise I have found no particular advantage in control of diet. (The relation of cancer to food and diet has become a very popular subject in England and America. With few exceptions, students of the subject do not believe that at the present time anything is proved. All that is written is fancy rather than fact.)

Dr. Bloodgood touched at some length upon the records of Dr. Czerny who claimed that in fifty years he had observed only some four or five cases of cancer where there had been a spontaneous cure; that is, where the patient entirely recovered without any treatment whatsoever.

"In about thirty thousand records which I have there has been not one spontaneous cure," declared Dr. Bloodgood.

He likewise does not believe that if longevity greatly increased over its present rate and even if the average person lived to be eighty or one hundred years old that there would be any marked increase in the number of cancer cases—not if the education in its treatment progresses as he expects it will.

I asked Dr. Bloodgood if it was probable that a cure for cancer will be found before we know exactly what cancer is.

He said that it is not beyond the bounds of reason. He cited the case of malaria. Quinine was found to effect a cure before the cause of the disease was at all known.

Oh, Where Are the Torchlight Processions?

Some Vivid Pictures of Uproarious Political Campaigns of the Past

By THOMAS J. MALONE

BETWEEN hard cider in 1840 and near-beer in 1924, much water has gone over the political dam. The apathy of the voters today contrasts strangely with the enthusiasm of elated Whigs for "Old Tippecanoe" which "set the prairies on fire." The color and the frolic have gone out of Presidential campaigns.

Log cabins on wheels heading endless processions, with live raccoons on the roofs, coon pelts stretched on the doors, marchers in coonskin caps, barrels of cider everywhere with generous tin cups; yes, and split rails, full dinner pails, hats in the ring—"grandfather's stovepipe," which proved not too large for "Bennie," and that other hat of beloved memory, soft, broad-brimmed, weathered, battle-worn—broomstick torches, party banners, party canes, party badges, party music, party songs! Where are they? What has become of the tumult and the shouting, yesterday's pomp of Presidential campaigns? Where are the endearing appellations denoting the popularity of party chieftains? "Old Hickory," "The Mill Boy of the Slashes," "Old Rough and Ready," "The Rail-splitter" and "Honest Abe," "Unconditional Surrender," belong to a day that is dead. Boy orators, whether from the Platte or either seaboard, fail to stir as of old.

Something departed from the zest of Presidential campaigns with the year 1912—with the last appearances in spectacular rôles of the two most colorful figures of the day in American politics, Theodore Roosevelt and William Jennings Bryan. The drift had been noticeable before, but the campaign of 1916, important in its issues as have been few others in American history, failed to stir the voters to any marked demonstration of enthusiasm.

Efforts to revive the old-time political rally failed. Parades were few. Speakers set forth and decried, lauded and condemned, but found it hard to get the voters out to listen. Audiences were small everywhere, except when the candidates themselves appeared, or others of distinctly national note.

Here and there, serious-minded folk, students of American politics, wonder whether a much-to-be-desired change had come over the people. Was the day approaching, dreamed by scholars, when men should, in Senator Hoar's phrase, do their thinking "with their brains and not with their heels"?

With "strict accountability" and "America First" keynoting the 1916 campaign, with Europe at war and America on the verge of entrance, but not knowing it, that campaign was as mild and ladylike an affair as history records. The voters refused to see red.

Were they doing their own thinking? Were they demanding that speakers regard them as intelligent beings and give them, as such, not the usual guff, but facts, facts and all the material facts?

The electorate went to the polls and elected the Democratic ticket. Four years later, after a campaign fully as lacking in the spectacular and the picturesque, they went again and elected—the Republican ticket.

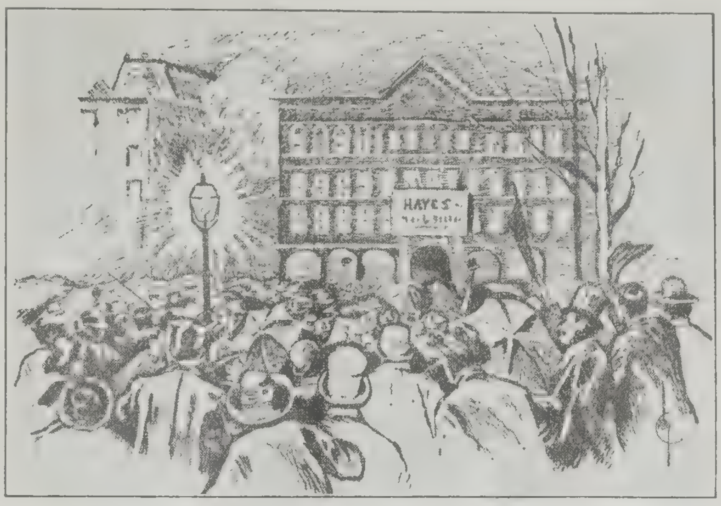
Now they are soon to make the same trip. Whatever the result, the winning party will hold that it was due to calm and deliberate judgment of the populace after a weighing of all the facts, and the losing party will hold it was due to an opaque perversity of the same. But, however that may be, the outlook is for a contest lacking in the one-time zest, punch and fun, the old relish, gusto, sportiveness, gaiety and whimsicality.

The Jackson campaign for re-election in 1832 marked the beginning of the kind of campaign that reached such perfection in 1840, of which more presently. There was the campaign of 1860, when the slavery issue split the Democratic party into two camps and made possible the victory of the newly organized Republican party with its "rail-splitter" candidate. The Hayes-Tilden campaign of 1876 was of the gruelling kind, culminating in a deadlock that was broken by a resort unknown to the Constitution. There was the Blaine-Cleveland campaign of 1884 when the idol of the Republican party, seemingly assured of victory up to a few days before the election, lost the battle because of an ill-advised remark of a "fool friend."

The achievement of young William Jennings Bryan, who went to the Chicago convention in 1896 with an "oration" in his hip pocket—or was it his coat-tail?—and with it hypnotized that convention into nominating him for the Presidency—ah, great days, neighbors; that *was* a campaign!

But none of the other campaigns in the history of the Presidency is held to have measured up, in country-wide enthusiasm and activity, to the Harrison-Tyler versus Van Buren campaign of 1840. Martin Van Buren was out for re-election, having succeeded Andrew Jackson as the latter's choice. The Democratic convention had not named anyone for the Vice-Presidency, deeming it wise to leave that to the states. Opposition to Van Buren was intense and widespread for various reasons, among them a feeling that the executive office, under him and Jackson, had been usurping powers not constitutionally warranted and a bitterness growing out of the panic of 1837. Many factions rallied to the call of "Anything to beat Van Buren."

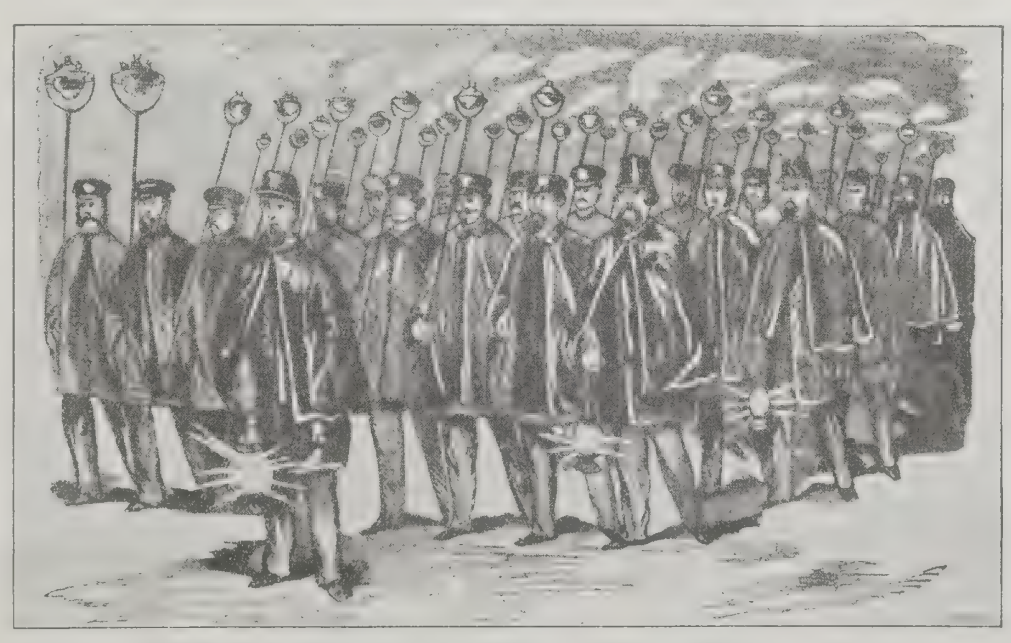
The Whigs nominated for the Presidency General William Henry Harrison, the hero of two famous battles, that at Tippecanoe, Indiana, in 1811, where he defeated an Indian force, and that at the Thames River, Ontario, in 1813, where he won over a combined force of British and Indians and where the Indian chief, Tecumseh, was killed. General Harrison had been governor of Indiana territory. He had served in both houses of Congress, from Ohio, and had been minister to Colombia. At the time of his nomination, he had retired, was living on his farm at North Bend, Ohio, and was clerk of a county court! He was in his sixty-eighth year.



Election excitement in New York City in 1876.

John Tyler, named for Vice-President, was a Democrat, or a so-called "State-Rights Whig," put up to win for the ticket the support of the "progressive wing" of his party. The first Vice-President to succeed to the chief magistracy of the United States through the death of the President, his conduct in that office was such as to put him at war with the Whig party. He serves as the "horrible example" of the unwisdom of nominating for the second place on the Presidential ticket a man not in full sympathy with the party advancing him.

As in the later Blaine contest, it was a "boner" on the part of Van Buren supporters that gave the Harrison men their cue, determined the nature of the campaign and indirectly contributed much to the defeat of the Democratic ticket. At the beginning of the campaign, a correspondent of the Baltimore *Republican* wrote of General Harrison, quoting an acquaintance of Clay's: "Give him a barrel of hard cider and settle a pension of $2,000 a year on him, and, my word for it, he will sit the remainder of his days in his log cabin by a 'sea-coal' fire and study moral philosophy"—in other words, would care no more about the Presidency.



Procession of the Wide-Awake Club of Hartford, Connecticut, on Thursday, July 26, 1860.
(From "Frank Leslie's Illustrated" Newspaper, Aug. 11, 1860.)

At once, Democratic speakers and press dubbed Harrison, contemptuously, the "Log Cabin and Hard Cider" candidate. The supporters of Harrison, far from being incensed, accepted the designation joyously. It appealed to the many that lived or had lived in log cabins and that regarded cider as the drink of the plain people as against the more expensive wines of the rich. The eastern wing of General Harrison's house was built of logs covered with clapboards. The rank and file accepted the report that he lived in a log cabin; they liked to think, too, that cider rather than wine was regularly supplied at his table.

For the Democratic press made the appalling blunder of harping, at the outset, on Harrison's alleged poverty, on his being a farmer and a mere clerk of a county court. The Whig convention that had nominated Harrison had not adopted a platform nor issued a statement of principles, preferring to make the campaign on the personality of its candidate and on opposition to Van Buren. The move of the Democrats played into their hands.

Whig speakers and Whig newspapers gave it out that their candidate for President, besides being a military hero who had served his country with honor in various peace-time posts as well, was a plain man of the people—poor, modest, living in a log cabin, wearing homespun clothes, drinking hard cider—a practical "dirt" farmer who, in response to his country's call, had left the furrow to guide the nation as its chief executive. "Cincinnatus" Harrison!

The Whigs made the campaign a continuous festival, from February to November. Carl Schurz writes that it was "a popular frolic," that "crowds came to be amused, not to be instructed; they met, not to think and deliberate, but to laugh and shout and sing."

The log cabin became the emblem of the Whigs. Every community, however small, had a log cabin built as party headquarters. Processions miles long were headed by log cabins on wheels, drawn by as many as six or eight horses. Live coons disported on the roofs, the latchstring was always out, hard cider was dispensed free to the thirsty. Sad though it was, the "cider" was sometimes a strong brand of rum, and intemperance often resulted.

Enormous crowds gathered throughout the country to hear the Whig speakers—and such speakers!—Webster, Clay, Corwin, Everett, Choate, Clayton, Prentiss, and others of almost equal note. Writing to a friend in November, 1840, Corwin, elected that year governor of Ohio, said that he had "made more than one hundred regular orations to the people" that summer, and that he had "first and last, addressed at least seven hundred thousand people, men, women and children, dogs, Negroes and Democrats, inclusive."

"Every ardent Whig," writes John Bach McMaster, "carried a Tippecanoe handkerchief, wore a Tippecanoe badge or a Tippecanoe breastpin, and hung in some conspicuous place in his house a richly ornamented certificate of membership in a Tippecanoe club, and knew by heart the popular Tippecanoe songs."

Such songs! Here are stanzas from two of them:

"Make way for old Tip, turn out, turn out!
Make way for old Tip, turn out!
'Tis the people's decree,
Their choice he shall be;
So Martin Van Buren, turn out, turn out!
So Martin Van Buren, turn out!"

"Oh, know ye the farmer of Tippecanoe?
The gallant old farmer of Tippecanoe?
With an arm that is strong and a heart that is true,
The man of the people is Tippecanoe."

Tyler was not overlooked in the Whig propaganda, though his record and personality did not lend itself so well as Harrison's to that style of campaigning. "Tippecanoe and Tyler Too" was a battle cry embodied in many a song:

"For Tippecanoe and Tyler too—
Tippecanoe and Tyler too;
And with them we'll beat little Van, Van.
Van is a used-up man;
And with them we'll beat little Van."

The Whigs represented that Van Buren was an aristocrat, lived in a palace, eating off silver plate and out of gold spoons, and drove a coach made in England. This picture was spread in such songs as these:

"No ruffled shirt, no silken hose,
No airs does Tip display;
But like 'the pith of worth' he goes
In homespun 'hoddin-gray.'
Upon his board there ne'er appeared

This Is Radio-Casting Station "H-o-m-e"

Modern Science Provides Powerful New Factor in the Training of Youth

By A. R. PINCI

I WAS waiting for a purchase being wrapped, confronting a boy intent upon examining a vast array of radio sundries of metal, rubber, wood, composition, porcelain, most of which were Polynesian to me. It was a methodical inspection, decisive as that of the most blasé purchasing agent, yet his chosen articles went to make up a little pile which to him represented a technical and scientific result, an amusement as well as an experiment. He was on equality with a group of men, and for all I know, their superior, perhaps, as a critical and successful customer.

From that day I took radio seriously, from an intellectual standpoint. I regarded it seriously, because an unknown boy set the example, for up to that time I had resisted interest in every way. The first "set" I saw and heard, more "saw" than "heard," by the way, was a crystal set, consisting of galena, a piece of green soap (occasionally divested of its electrical insulation duties for use in a tub, judging by its diminishing size and obliteration of the trade-mark), endless wire to somewhere and something, and listening apparatus. By dint of politeness and fervid imagination I agreed that what "I heard" was wonderful, because one's hostess must be complimented, especially after she explained that it cost her $6.93, her son making it. I assumed that homemade radio was about as efficient as a homemade watch; as against the screeching, distorting, raucous horns in some shops, I believed that the best place for radio was where I had often seen it functioning—on board an ocean liner.

Yet I could not dismiss the boy's intentness and seriousness, because a boy's seriousness is more important than a man's.

"There has been a reduction of 41.7 per cent in Juvenile Court cases in the United States in the past year, due to the influence and the growing popularity of radio."—*Mansel Keith*, speaking before the Convention of the Associated Manufacturers of Electrical Supplies, held in Atlantic City.

The boy converted me, and just in time. I am not a fan; in fact, a long way from it, but his earnestness inspired me to make a study of the radio question, which led me to the executives of famous electric and manufacturing corporations. From the soap set, which had a negative influence upon me, I played with the latest superheterodyne with a virtually unlimited range. At the moment I am writing this, my ear is treated to the morning service of a famous Fifth Avenue church, which proves that even impious newspapermen do the unexpected, just as forty hours ago I heard President Coolidge. It is almost a matter of habit now to punctuate my space bar, as I typewrite, to whatever tempo radio sets for me.

As will be demonstrated, radio is doing the unusual, but before that is outlined another attending circumstance must be adverted to. Whether it is the novelty of the thing or the urge to get one's money's worth all at once or the failure which attends the race for station long records, too many persons bespeak either disappointment or satiety. Too many individuals, by some all-too-prevalent misconception, have saturated themselves with mediocre features, listened to on the wholesale plan during the first weeks or months of radio receiving, oblivious to the fact that the fullest enjoyment of radio, for any and every member of the family, depends upon knowing how to discriminate. This selective process ought not to be difficult now that the newspapers print daily complete programs.

Eighty-three broadcasting stations were abolished on June 30 last at the close of the fiscal year, to eliminate from bureaus the records of all stations for which licenses had expired and applications for renewal had not been received. This decrease should be spread over the months of April, May, and June, making an average of twenty-eight stations closed each month for the period named. Since June 30, six of these stations have submitted applications for renewal licenses. It is believed that very few of the others will reopen to offset the decrease. Seventy-five new stations were licensed during the same period.

The presence of a radio receiving set, whether it is a simple one-dollar set to the most refined costly instrument, is not sufficient reason that it must be constantly operated merely because broadcasting is in the air, any more than one must read every word of a newspaper just because it's printed. By discrimination a radio listener improves the set's possibilities a thousandfold, makes it a necessity instead of a habit, and adds the benefit of a late major invention at little or no expense and trouble.

It's like living over again three distinct eras which most readers know how to time and appreciate. First, that of the piano whose presence in the average parlor was as if a challenge to every heavy-fisted fellow and nervous-fingered woman to pound on a chord, or worse still, part of a chord, after peering underneath the shiny cover, which gave rise to the town colloquialisms of punishing the piano and punishing the neighbors.

Second, the phonograph, which seldom boasted a repertory of more than twenty records, thirteen of which were the classics of the hurdy-gurdy and therefore too much of a good thing. Count that moment lost that the needle did not screech. That led to another phrase of decidedly native piquancy—getting "their first payment's worth," until the impatient collector was told to take the machine away.

Third, the motor car. Opposition to the word "pleasure car" has almost severed two mismated words, in accordance with truth. A motor car is no more a pleasure instrument, as the word goes, than a fine watch. The advent of an automobile in a family meant, for many years, insensate riding anywhere at all times. A household chore around the block could not be undertaken without the vehicle. The idea of a delightful afternoon was to cruise up one side and down the other of a fashionable street. A motor party meant going "somewhere," which meant nowhere except that indeterminate point where return was imperative. Now the "let's go for a ride" idea is passing, and with it has entered a better understanding of a staple-like efficient locomotion.

I should like to add the movies as a fourth, but the movies are still crowded by too many who go there as a matter of habit. Discrimination on the part of the movie-going public is, despite advertisements of producers and showers to the contrary, a long way off. There has been a noticeable improvement in picture-making, but the crux is that there are yet too many vapid ones. They are now at that stage where conspicuousness of luxuriousness is prevalent in everything, which brings to mind a remark recently made by a member of the Vanderbilt family that she had never seen the interior of a millionaire's home which in any way resembled the directors' idea of it, judging by the pictures they authorize.

The movies, in particular, are still drawing heavily upon a contingent which has an hour of time to kill, and unfortunately they have killed no little individualism. A reaction is about to set in, inevitable reaction, and radio has contributed toward speeding it along. In the trade the effect of radio upon audiences has been discussed. It is next to impossible to determine even approximately the merits of this contention. Yet one need not concede more than the principle involved and recognized—that the movie interests have been alarmed by the possibilities of radio, and one or two farseeing ones have taken up "the air" as part of their business. There is no denying that radio has, in two years, absorbed many millions of dollars which otherwise would have gone to the film interests. Incidentally, there is the money which has gone to the hardware dealers. Making a simple set involves an investment of at least a dollar for an embryonic tool chest. It means carpentering, mechanical work, a rudimentary familiarity with electricity. Many a chap who was wont to telephone a plumber for help now knows how to tighten a union by his having learned how to tighten joints of a radio receiver.

No more need be said here than that the "make it yourself" idea has been overdone and that disappointment, extravagance, fraud and poor business have been the result of the radio craze from that standpoint. Just why the public was urged to "build your own" in radio, which is not done with automobiles, clocks, typewriters, lawn mowers, and the like, is neither here nor there.

To hundreds of thousands of boys, some of whom built their sets progressively, keeping pace with financial ability, the build-your-own has been a material advantage. Not only is there the educational side to consider, but there is, in radio, the welcome tendency to restore home-life, especially evenings. The family circle after dinner threatened to become extinct, between jazz dancing and the movies, but radio is knitting it together again.

The improvised shop of Tim Connor, who must use the kitchen table for a bench, and his ten-cent tools, vies to all intents and purposes with the diminutive model shop with a complement of fine tools in the fashionable home of Reginald Cashis; both "plants" are witnesses of industry, inspired by enthusiasm, and what is wrought by them *actually works!*

Tim hopes, of course, that "pop will fork over" enough to add another stage of amplification or some such nicety; Reginald thrills because his aristocratic mother (from one to three generations removed from laboring relatives) is proud of him—future banker or executive.

In a nearby electrical shop a boy, whose father has many more millions than Tim Connor has tubes to his set, bought many radio parts, jealously refusing the advice of the family chauffeur.

"I know my radio better than you know your car," he said pointedly, and the car outside is one of the finest produced in this country.

No one need deny, or can, that that is a much safer argument for a boy than that in vogue two or three years ago, as to who was the best villain in the movies. I am speaking, of course, of that happily short era of "bad men." Thus, taking Reginald and Tim as representing the very best cross section of boy's life in this country today, one must give radio a great deal of credit for the change.

We regard it as nothing unusual now to plug in and listen to the President of the United States on some public question. No thought at all is devoted to the privilege of plugging in and hearing a program from Carnegie Hall, for example, to which tickets may cost $3. About every public man and famous private individual has been heard. An exception, I believe, is John D. Rockefeller, senior, but there is the expectation that he will make his radio bow in the near future, perhaps in connection with the new fifty-three-bell carillon which he is donating to his church on Park avenue, the largest set of chimes in the world. Transoceanic radiophony is being experimented with and it is predicted that in due time it will be successful, although prior to that the enterprising broadcasters will arrange, no doubt, to retransmit in conjunction with wires. Foreign notables and features will be added to our domestic ones.

Maximum good influence must attach to the voices of individuals prominent in life, even though the things heard have no appeal or interest to every auditor, and in a formative way a greater influence upon boys than their elders. Oddly enough, it appears that girls have little use for radio, and that they are chiefly responsible for the jazz-overcharged programs featured by many stations. At first, in fact, the average woman was an enemy of radio. To begin with, she objected to it on the strength of added expense. Where expense might be no object, however, nearly every housekeeping daughter of Eve objected on the grounds of messiness. She resented the strewing about of tools, material, wire, and many a domestic feud has been staged on the strength of antennae and indoor wiring. Strategy won in many cases, although that day is passing now, with the advent of sensitive instruments which require no external wiring whatever, by erecting a set surreptitiously "when ma isn't looking," and letting her meet it for the first time in operation at a moment when an appealing feature might be on. That ma is no longer very particular is evident by the number of lead-in wires dangling in front of houses, and homemade lead-ins are often unattractively set, in point of looks as well as technical efficiency. Split wood, of the kind that comes from the grocer's, is used for arms and supports, and this unadornment is perceivable in front of beautiful residences as well as cheap tenements.

Beautiful cabinet sets are now available, so that they may grace the finest period rooms, or find a welcome corner in music room or library, but the cabinet itself is of no importance. Commercially, this is a broadside against the more finicky wealthy class, although the chances are that if any boys are in the family a radio of some kind must exist.

The average boy is just as happy with his own humble set as Calvin Coolidge is with his very fine receiver, though late reports have it that Pope Pius has not been very fortunate with the set recently installed for his benefit at the Vatican. T. H. Kenny, of Hull, Canada, recently completed a crystal set at a cost of eight cents, with which he has received Pittsburgh and New York, which, academically as well as practically, is getting a great deal for one's money, but lest that be too much, he suggests a single wave-length (one station only) set for three cents. Radio is not to be included, on these terms, in the high cost of living.

Naturally, there is a great deal of pleasure and enjoyment in twirling the dials of, say, the second-harmonic superheterodyne which represents the latest achievement. Scientifically, the superheterodyne represents, as of today, the ultimate in radio receiving, and an attempt to build it, from an amateur standpoint, is like determining the fourth dimension, since it involves a large number of rejections at final factory test, so rigid is inspection and so exacting its requirements.

But radio as radio, what more could be asked of it than the ease with which it brought home to millions of interested citizens the proceedings of the two national political conventions? I attended both of them personally, and I am sure that any good receiver yielded a better perspective, applied to the ear, than a personal visit. All the comforts of home—and all the wealth of what's going on in the world to boot! Nor is that all.

When the West End Presbyterian Church broadcast a holy communion service for the benefit of the shut-ins last Good Friday a special public service was performed. Rev. Dr. A. Edwin Keigwin conceived the idea and when the preliminary announcement was made there were not a few in New York City who had some doubts about it. It was not an objection so much as it was the feeling, probably, that radio was accomplishing too much

(*Concluded on page 11*)

Are the College Fraternities Dying Out?

Growth of the System Has Been Hampered by Abnormal Conditions

By ANDREW R. BOONE

WHAT of the college fraternity? Has the Greek-letter group increased its initiates proportionately to the growth of the student bodies in America's colleges and universities, or is the college fraternity dying out?

It seems at first blush as though that famous old institution, dear to the hearts of several hundred thousand "old grads" and present students, is passing slowly from the picture. Fraternity men, steeped in the traditions of their "house," will be the first to deny that their nationals and locals are losing their hold; but a consideration by some of their leaders has resulted in a somewhat different conclusion.

The war and attendant conditions caused an unprecedented increase in student numbers during and after 1920; total college enrollment jumped forty per cent during the two years prior to and including that period. Presidents and deans of men throughout the country have called attention to this fact repeatedly. As William M. Lewis, president of George Washington University, said when he was installed last year, "There is a larger percentage of our youth attending colleges this year than attended high schools thirty years ago—this is a century of education and therein lies a problem of stupendous difficulty for institution and individual. Because of the universal awakening of appreciation of the value of education there are flocking to the doors of universities countless thousands."

Judge William R. Bayes, national fraternity figure, recognizes the danger which threatens the fraternity system when he asks, "Has there been a proportionate increase in the number of men received into the chapters of the various national fraternities undertaking to serve those institutions?" Judge Bayes put that same question to the delegates at the Interfraternity Conference Convention in New York last November—men representing some fifty of the general, national fraternities, all of which have been established more than six years. And he answered his own query: "My personal belief is that there has not."

"It is apparent," Judge Bayes says, "that there is one method of meeting this unquestioned demand, and that by the organization of one or more new national fraternities. This I maintain, in the first place, would be in the interest of the local fraternities themselves. The vast increase of local fraternities in recent years is in a large measure due to the failure of the national fraternities to extend in proportion to the increased student enrollment. This may readily be confirmed by consultation with college presidents and deans who are familiar with campus activities. It is too clear for argument that the multiplication of segregated local groups without definite plans for nationalization adds to the confusion and interferes with the proper growth and development of the local fraternities themselves. Besides, belonging to a fraternity maintained on national lines with chapters and alumni throughout the country presents special advantages to the member who is looking beyond his four collegiate years.

"In the second place, I believe an increase in the number of national fraternities is to the best interest of the nationals as well. We who are gathered here of course have faith in the fraternity system. Close observers affirm, however, that the fraternities cannot permanently endure unless at least forty per cent to fifty per cent of the young men properly qualified in a given institution are admitted to membership. If some such proportion as that be assumed as substantially correct, although for my part I wish that every young man of good character and proper ideals might become a member of a national fraternity, then it is evident that the establishment and development of additional fraternities having national aims and aspirations is fundamentally and vitally in the interest of all existing nationals.

"But finally and paramount to every other consideration, this increase would be to the best interest of our institutions of learning. The fraternity as it exists in this country grew out of and is a part of the college itself. Our colleges, as we know, constitute the bulwark of this, our republican form of government. By their training of our young men they are rendering a service beyond measure. Because of that they are here to stay. So let our fraternities take service for their watchword—service, ever more service. The field of opportunity is without limit. Those of us who cherish our fraternities should unitedly strive to overcome and remove their defects, and upbuild and extend their elements of strength to the end that they may be in truth, as they were designed to be from the beginning, genuine instrumentalities of service."

Two dangers threaten the fraternity system which need recognition. Colleges may exclude the fraternities as Princeton does, or state legislatures may by enactment declare them illegal.

One may add that non-fraternity residence halls for men, approximating in elegance the fraternity houses, also greatly assist in placing the "barb" upon a somewhat equal footing with the fraternity brother.

Judge Bayes' frank admission concerning the democratization of fraternities may not be to the liking of impulsive young fraternity men who have been wearing their insignia of membership only a few years. More than a half-million of the some 700,000 initiated since the American fraternity system was founded 174 years ago are still alive, and the question is vital to all those living members. The truth of his statement must be admitted in the light of facts; and certainly the fraternities are taking steps to bolster up their waning numerical strength.

As a background for the story of how the fraternities are trying to fill up their ranks, let it be recounted that the fraternity system consists of approximately 200 societies with 4,500 chapters in 660 colleges. Of this number, approximately 1,000 chapters are members of honorary scholastic societies and make little effort, if any, to maintain active social groups.

Upper picture—Union Building, University of Michigan. Lower left—Delta Upsilon Fraternity House, Cornell University, Ithaca, New York. This is one of the oldest fraternities in America. Lower right—Phi Sigma Kappa Fraternity House, Cornell University, Ithaca, New York. Insert, upper left—Phi Beta Kappa Key. Insert, upper right—Delta Xi.

Approximately 2,600 of the remaining 3,500 chapters live in college homes of their own provision. Some 1,100 of these are owned by their occupants and cost about $21,000,000. Furnishings of the homes that are leased, according to fraternity figures, have cost the chapters about $3,000,000 more. At present, about 60,000 college men and women live under their own roofs, and efforts are being made to increase the owned homes. Forty thousand freshmen, in round numbers, are initiated each year, while several thousand older boys are elected to honorary fraternities and societies as recognition for meritorious work in the classroom.

This really remarkable growth, even alongside a more rapidly increasing student body, had its inception in "The Flat Hat Club" at the College of William and Mary in 1750, a secret literary and social society which held regular meetings, had a secret hand clasp and issued to its members the first fraternity badge, circular in form, one and three-sixteenths inches in diameter, with plain, smooth edges. As the tradition is told, the first badge was worn by James Innes, distinguished as attorney-general of Virginia after Edmund Randolph. "The Flat Hat Club" lasted some twenty-five years, no definite record of its proceedings appearing after 1772. Thomas Jefferson, in a letter written to John D. Taylor, of Maryland, stated that he was a member of this club and that "out of it the Phi Beta Kappa, founded in 1776, might have arisen."

Phi Beta Kappa was organized by five students in William and Mary on December 5. John Heath was chosen its first president. This society, whose golden key is now so familiar among college graduates as evidence of scholastic achievement by its possessor among books, was the first society to adopt an Hellenic name and to use the Greek alphabet in naming its individual chapters. This society and Sigma Xi, the honorary scientific society, have now nothing except Greek letters in common with fraternities.

The next important society bearing Greek letters was formed at the University of North Carolina at about the beginning of the War of 1812, while in 1813 a local fraternity of short duration sprang into being at Yale. At Princeton in 1824, a Greek organization was started, but the faculty effectively put an end to it the following year and for all time at Princeton.

By the middle of the century, fifteen fraternities with many branches had been formed in several colleges; and during the following fifteen years, the number had increased to twenty-five. By 1865, 375 chapters had been organized, of which ninety-one had ceased their activities because of faculty displeasure. Only one new fraternity was added to the list between 1869 and 1890, but the number of active chapters increased to 762.

The number of fraternities had increased to thirty-seven by 1900, with 945 chapters actively participating in the work of the organization; and, in 1922, the records tell of 2,000 active chapters in fifty-five nationals, with 60,000 active members, to whom 20,000 new initiates are being added each year.

To arrive at their present strength, the college fraternities have passed through many vicissitudes, probably the most challenging of which have been the anti-fraternity crusades, waged periodically in many states. The true cause of opposition in the earlier days to student secret societies is ascribed by fraternity men as the "atmosphere of distrust and narrow sectarianism in which the faculty minds had been reared. When they had been students there had been no such thing as individual responsibility; and they still believed that the new generation should conform to the restricted conditions as they themselves had done a generation before."

As a result of the intense opposition, the fraternities passed through a state of extreme secrecy. So rigorous were some of the fraternity laws that a member dared not wear his pin on outer garments; nor could he declare that his fraternity had a chapter at another college without that chapter's permission. The secrecy with which the members regarded their oaths and information of each other's membership depended largely upon the degree of faculty opposition.

The government of the various chapters began to mend after 1870, and with that change opposition slowly withdrew, until today, while it is occasionally bitterly fought in some sections, opposition to college fraternities, not being efficiently organized, is generally of little import.

It is reported by a fraternity investigating committee that, of the approximately 900 institutions of collegiate rank in the United States and Canada, there are no restrictions in about 660 of them, and "the attitudes of the college authorities toward them (fraternities) ranged all the way from ignoring them entirely to full recognition and closest co-operation between the authorities and the fraternities."

The committee found that in 200 of the institutions there are neither fraternities nor sororities, and it declared that an impossible environment explained the absence of the units in many of these. In several of these institutions, the fraternities were absent even though no restrictions had been imposed.

Restrictions of various kinds—college regulations, sectarian objections, traditional opposition or legislative prohibitions—appeared in 117, while in ninety-six the absence was ascribed to "conditions inherent" in them. Administration rules and church inhibitions rule them out in twenty-two colleges.

The most recent skirmishes between fraternity leaders and the law have taken place in the South. A movement to repeal the anti-fraternity law, originating in the student body of the University of South Carolina in 1920, failed in that state, and a second attempt at the same result was halted by the fraternity people when they decided it was not the proper time to urge the measure. A similar agitation for repeal of an anti-fraternity measure in Mississippi has not yet borne fruit. Four anti-fraternity bills were prepared in Texas during late 1922 and early 1923, one of which had its inception in the student body of the University of Texas. A special fraternity committee was appointed to deal with the situation, and, as a result, none of them were introduced.

These clashes have not proved to be the best means of adding to the national fraternity strength, the fraternity leaders have discovered; and, as a result, new tactics are being tried. It is now urged that new national fraternities be formed by groups of local fraternities, groups having only one or very few chapters. By increasing the number of national fraternities and adding to the number of local fraternities, living facilities will be gradually provided for members of additional chapters. The fraternities, some of which guard their traditions jealously, and are exceedingly slow to join the scheme for expansion, are on the whole in sympathy with the newly suggested program of extending their charters to new houses and of forming one or more new national fraternities.

A significant step in this direction was taken last November at New York, when seventy of the 500 local fraternities, none of which has a national organization, met and formed the Interlocal Fraternity Conference. The interlocal conference functions along lines similar to those of the Interfraternity Conference, whose membership comprises national fraternities, and was formed

'Getting the Drop With the Law'

Should the Law Be Used as a Pistol With Which to Shoot Your Adversary?

By C. C. DANIELS

OF THE NEW YORK BAR

THAT part of Oklahoma, formerly known as the "Cherokee Strip," was thrown open to settlement on the sixteenth day of September, 1893. I was appointed County Attorney of "L" (afterward Grant) County, and began to fill that office and prosecute the criminal docket before there was a house in the county seat.

Those who "made the run" and secured homesteads were of divers sorts and kinds from every section and of every grade of intelligence and the questions presented for solution were many and varied.

Some months after the "opening" a man came into my office (which was a tent) and, after stating his complaint against the man whose claim adjoined his, said, "Ain't I got the drop on him with the law?"

This occurred more than a quarter of a century ago and his question presented to my unsophisticated mind a new angle as to the ethics of the profession of law and the functions of a prosecuting attorney. Closer acquaintance with the customs of the "wild and woolly West" in those days when each man had buckled around his waist a six-shooter ready to get "the drop" on the fellow who showed any disposition to commit suicide by letting the other fellow get "the drop" on him, the question was natural and in keeping with the vernacular of the country.

The Line Fence Demon

THE man who wanted to know if he did not have "the drop on the other fellow with the law" complained that his neighbor had assaulted the wife of the complainant. On further inquiry it turned out that the alleged assault occurred months before, but feeling between the two men had been engendered only a few days before his visit to my office, and the occasion of the trouble was a line fence. I told the complainant that if an assault on his wife was not of sufficient importance for him to make complaint until after trouble arose about a line fence, he did not have "the drop" on his neighbor "with the law" so long as I was the public prosecutor in that county. He thereupon threatened to see to it that I was not returned to office at the coming election, but as I was a Democrat and only about ten per cent of the voters of that county were Democrats, his threat had no terror for me.

The law appears to be regarded in some quarters as having the characteristics and uses of a pistol, to be brought into action when you can get "the drop" on the other fellow. Only those familiar with the daily grind of the courts realize how general is this conception of the law and its functions. Many people think of the law and its administration in terms of securing the advantage of an adversary by the enforcement or refusal to enforce the law, and questions of right and justice become secondary.

I was talking with a jurist some time ago about the duty of the judge to make his personality felt in the courtroom to protect those required to attend court from injustice and the violation of their rights, whether those rights were invaded by officers or private persons. He expressed himself in such a way as to make me feel that in his judgment the judge occupied a position similar to that of a referee of a prize fight or an umpire of a baseball game and that the way to "hold the scales of justice even" was to decide in favor of the winner according to the "rules of the game" and when he had done that, no further responsibility rested on him—unless somebody attacked "the dignity of the court." In that event he was justified and expected to utilize all the power of the judiciary to "preserve the dignity of the court." It is gratifying that there are few judges who agree with him.

The average man wishes that a good part of this outraged dignity could be bottled up and brought forth and made effective when some plain, timid citizen is blackjacked into insensibility or some man accused of crime has been put through police examinations that outrage every element of the principles of human rights as defined by our civilization and our laws.

Getting the "drop with the law" and using it has been a favorite pastime for many years.

Some of the Victims

ANDERSON, the superintendent of the Anti-Saloon League of New York, is serving a term in Sing Sing on conviction for forgery. It seems that the jury found that he changed, or ordered changes made in, the books of the Anti-Saloon League. The directors and officers of the league made no complaint—in fact, they gave Anderson a "clean bill of health" so far as they could do so—but somebody had "the drop" on Anderson "with the law," and he is "doing time."

Incidentally, Anderson was a factor of great force in securing prohibition and in working for its enforcement. His conviction and imprisonment was a blow to the cause with which his name was linked but, great as the pain this must have caused to those who want to see New York "as wet as the Atlantic Ocean," the "dignity of the law" had to be upheld. An example had to be made of those who tamper with the records of corporations and organizations and where could a more conspicuous and shining example be found than Anderson! We are expected to believe that because of Mr. Anderson's experience every corporation in New York will henceforth keep honest books. For, of course, Mr. Anderson's prohibition connections could have had nothing to do with the zeal with which he was prosecuted!

Another case in which some people thought they had "the drop with the law" on a man was when those who did not want any investigation of the Department of Justice under the administration of Attorney-General Daugherty succeeded in having an indictment found against Senator Wheeler, of Montana, on the charge of representing a client before one of the departments after his election to the Senate. An investigation by a committee of the Senate, headed by Senator Borah, made it clear that the indictment was not justified and that it was sought for purposes and secured by means that reflected no credit on the Department of Justice. Instead of accomplishing the purpose evidently intended of stopping the investigation of Daugherty and his administration of the Department of Justice, it was found that Senator Wheeler was not easily frightened and instead of "calling off the dogs" the chase continued. The "best minds" who thought they had "the drop with the law" on Wheeler found that the gun "kicked back" and the only ones injured were those who stood back of the gun and not the one in front.

The professional bill-collecting attorneys in some jurisdictions get "the drop with the law" on impecunious debtors in ways that are of doubtful "ethics" although "within the law." One plan is to have a friendly assistant district attorney issue a subpena for the debtor to call at the district attorney's office with a view ostensibly of investigating a complaint lodged against the debtor. The debtor, of course, responds to the subpena and settles with the attorney who has the claim in hand; the complaint is thereupon withdrawn and no further action taken.

Such uses of the processes of the criminal law may add to the income of the professional bill collector but the seed of oppression and corruption are necessarily sown where only justice should be permitted to grow. The criminal law was not established as a means of collecting debts, though its enforcement may, and often should, have that effect and its use for the avowed purpose of acting as a club merely to enforce the collections of debts does not tend to make the people respect the law. The criminal law was not adopted nor is the office of the public prosecutor maintained for the purpose of enabling lawyers who "stand in" with some assistant to get "the drop" on a creditor "with the law." The forum for the litigation of claims for debt is the civil courts.

Cashing in on Contempt

THIS unjust use of the criminal processes of the courts in New York has been greatly reduced under the administrations of both District Attorneys Swann and Banton, and efforts completely to eliminate it are steadily made.

A large part of the work of the district attorney's office is devoted to ferreting out and punishing fraud, and there must necessarily be lodged large discretion in the district attorney's office. My experience of years as a prosecuting officer makes me realize that it is neither just nor accurate to judge a prosecutor by one or two cases nor without full knowledge as to the matters with which he must deal.
